Survey of the World

The Tax on Corporation Net Earnings

Mr. Aldrich, chairman of the Committee on Finance,

reported to the Senate, on the 25th, the proposed amendment to the tariff bill, providing for a tax of 2 per cent. on the net incomes of corporations. This is the tax advocated by President Taft in his recent special message, and it is intended to be a substitute for what is called the Bailey-Cummins amendment for a general income tax. It is understood that fifty-two Republicans have agreed to vote for the new amendment, and that this number includes twelve of the Republicans who were regarded as supporters of the proposition for a tax on individual incomes. The text of the new amendment would fill five of our pages. A summary of it follows:

Every corporation, joint stock company or association organized for profit and having a capital stock represented by shares, and every insurance company, shall pay annually "a special excise tax with respect to the carrying on or doing business," equivalent to 2 per cent. upon its entire net income over and above \$5,000 during the year, exclusive of amounts received by it as dividends upon stock of other companies subject to the tax.

The taxable net income shall be ascertained by deducting from the gross income (1) all the ordinary and necessary expenses actually paid within the year out of income for the maintenance and operation of the company's business and properties; (2) all losses actually sustained and not compensated by insurance, including a reasonable allowance for depreciation of property and the sums required by law to be carried to the premium reserve funds of insurance companies; (3) interest actually paid on bonded or other indebtedness to an amount of such indebtedness not exceeding the paid up capital stock; (4) all sums paid in taxes; (5) all amounts received in dividends upon stocks of other companies subject to this tax. In the case of a company organized under the laws of a foreign country, the

several items are to be those furnished by its business, income, debt, etc., in the United States.

After \$5,000 has been deducted from the net income so ascertained, the tax is to be computed upon the remainder, for the year ending December 10, and true and accurate returns must be made under oath or affirmation by the company's officers on or before March 1, to the Collector of Internal Revenue for the district, setting forth the paid up capital stock, bonds and other debt, gross income, dividends received, amount of ordinary and necessary expenses actually paid out of earnings, losses actually sustained, amounts allowed for depreciation, amounts carried to insurance premium reserve funds, interest actually paid on bonds or other debt, taxes paid, and net income after the authorized deductions have been made.

* Whenever evidence is produced before the Commissioner of Internal Revenue which in his opinion justifies the belief that a return is incorrect, or when a company fails to make a return as required by law, he may require from the company such further information as to its capital, losses and expenses "as he may deem expedient," and he is authorized in such cases to have the company's books and papers examined "by any regularly appointed revenue agent specially designated by him for that purpose," to take the testimony of officers under oath, and to invoke the aid of the Federal courts in such an inquiry. All such proceedings are to be subject to the approval of the Secretary of the Treasury.

In case of a return "made with false or fraudulent intent" the tax is to be doubled, and 50 per cent. is to be added in case of refusal or neglect to make a return or to verify it. But when neglect is due to sickness or to the absence of an officer, a delay of thirty days may be allowed. Notice of the amount assessed is to be given on or before June 1, and the tax is to be paid on or before June 30. The returns with corrections made, if any, "shall be filed in the Commissioner's office, and shall constitute public records and be open to the public as such."

It is made unlawful for any collector, agent, or other employee of the Government to divulge or make known, in any manner not provided by law, to any person, any information obtained by him in the discharge of his official duty, or to make known any document received, testimony taken, or report made, "ex-

...with the general direction of the President." The penalty is a fine not exceeding \$1,000, or imprisonment not exceeding one year, or both. For refusing or neglecting to make a return, or for making a false or fraudulent one, a company may be required to pay a fine not exceeding \$1,000, or imprisonment not exceeding one year, or both, for each violation. The act also provides for the verification of a return, and who makes any false or fraudulent return or statement with intent to defraud, or to evade the assessment, shall be guilty of a misdemeanor, and shall be fined not exceeding \$1,000, or be imprisoned not exceeding one year, or both, with the costs of prosecution." All laws relating to the collection of internal revenue taxes, when not inconsistent with this act, are made applicable to the collection of the new tax.

It is said to be the purpose of the committee and those who stand with it to prevent, if possible, any changes in the provisions of the amendment. A long debate upon the proposition is expected, but the passage of it in both the Senate and the House is predicted with confidence. Many protests have been received by Senators. The Chicago Association of Commerce makes objection because, while corporations and joint stock companies are taxed, individuals and co-partnerships engaged in the same business go free.

8

The Senate's Tariff Work

In the tariff debate last week considerable progress was made. Talk about the proposed duty on hides consumed two days. The House put hides on the free list; the Senate committee asked for a duty of 15 per cent., and this was ordered, by a vote of 46 to 30. In the discussion the usual charges against the Beef Trust were made, and the friends of the farmer and ranchman opposed the friends of the manufacturers of shoes. Mr. Carter said that twenty-two Republicans were ready to vote for free shoes and leather if the duty on hides should be cut off. Mr. Stone's motion to make hides, leather and shoes free of duty was lost, 46 to 40. In the case of 40 to 46 party lines were broken and the Republican majority group was split. The votes upon the lumber and coal duties also defied classification. The House made the duty on rough lumber \$1 per thousand; the Senate committee raised this to \$1.50, and was sustained. Fourteen Republicans voted for a duty of \$1, while ten Democrats and eight Democrats voted for the committee's increase. The

vote by which the committee carried its entire lumber schedule was 50 to 28, about a dozen Democrats acting in opposition to their national platform. The House had made the duty on bituminous coal 67 cents a ton, with provisions for reciprocity that would permit free trade with Canada. The Senate committee cut out reciprocity and proposed a duty of 60 cents. A motion to reduce this to 40 cents was lost, 28 to 44; another, to restore the House provisions for reciprocity, was defeated by a vote of 24 to 47. In response to the pleas of the Senators from Florida, the duty on pineapples, as proposed by the committee, was increased, the vote being 34 to 30. The addition is not clearly shown, but a current estimate is that it amounts to 128 per cent. It was demanded for the defense of Florida against the fruit growers of Cuba. Mr. Beveridge attacked the manufacturers of cash registers, asserting that they had formed a monopoly, in violation of the Sherman act, and were selling registers in Europe for one-half the price exacted in this country. There were 500,000 in use here, he said, and \$75,000,000 had been paid for them. His motion to reduce the duty from 30 to 15 per cent. was lost, 31 to 33. The House bill's duty of 5 per cent. on sole leather was raised to 10 per cent., and its duty of 15 per cent. on shoes to 20 per cent., the vote being 32 to 24. Mr. Clay said that our exports of shoes were nearly \$10,000,000 and our imports only \$41,000. He did not see why a duty was needed. Mr. Bristow's motion to put shoes, leather, hides, harness, etc., on the free list was laid on the table, 33 to 23. Mr. Bailey spoke for three hours in defense of votes cast by himself and other Democrats for duties recommended by Mr. Aldrich's committee, denying that Democratic doctrine demanded free raw materials. Pig iron and scrap iron were made dutiable at \$2.50 per ton. A motion to reduce this to \$1.50 was lost, 26 to 45. The House bill's rates on wire nails were increased. Mr. Stone denounced the Harvester Trust, and a motion made by Mr. Bacon to put agricultural implements on the free list failed, 20 to 45. Amendments concerning wood pulp, proposed by Mr. Brown, were accepted by the committee and adopted. They make mechanically ground pulp free of duty and are

quite satisfactory to the publishers who have sought to reduce the cost of paper. The House put crude petroleum on the free list. Independent producers of oil have since asked for a duty, saying that the Standard Oil Company might injure them by free importations from Mexico. The Senate, by a vote of 34 to 40, defeated Mr. Penrose's motion for a duty of one-half a cent a gallon. As the Senate and the House agree about this, crude petroleum will be on the free list in the new tariff bill.

Labor Controversies . . . Owing to the announced decision of the American Sheet and Tin Plate Company (a subsidiary of the United States Steel Corporation) that it will not recognize the union in its mills after July 1, the union employees of the company, about 10,000 men, have voted to strike on that date.—The controversy concerning the employment of negroes as firemen on the lines of the Georgia Railroad Company was submitted on the 26th to the board of arbitration, which is composed of Hilary Herbert, formerly Secretary of the Navy; Congressman Hardwick, of Georgia, and Chancellor Barrow, of the University of Georgia. In the course of the hearing the arbitrators ruled that all testimony relating to public opinion should be excluded. Counsel for the white firemen who went on strike had said, in his statement of their side of the case:

"This commission will have to take into consideration the state of public mind in so far as it affects the safety of passengers or the safety of other employees of this railroad. We purpose to prove that the people of this State are so bitterly inflamed against the negro firemen that were you going to restore them to their positions, or were the railroad, under your decision, to put them on the engines again, there would be violence and bloodshed and the lives of neither employee nor passenger would be safe. We will bring here the mayors of cities and others who have investigated and who know. They will tell you that the people of the State will not stand for the negro in the cab and that if you try to force them in there will be trouble."

He admitted that negro firemen were then at work, but said the employment of them was permitted by the people, pending the arbitrators' decision. On the 27th the arbitrators announced their award, which is in favor of the negro firemen, provid-

ing that there shall be no seniority of white firemen over negroes, and that negroes shall receive from the railroad company the same wages that are paid to white men in similar positions. Firemen in line of promotion must have three years' experience before they can be engineers. Congressman Hardwick, the arbitrator chosen by the white firemen, voted against the essential parts of the award. In a dissenting opinion he said: "In so far as the above finding permits the continued employment of negro firemen I dissent, because I believe from the evidence that such employment is a menace to the safety of the traveling public."—A strike of the 3,000 employees of the street railways in Pittsburgh began on the 27th. They assert that the company has not kept its promise concerning an adjustment of runs and a shortening of the work day.—In LaCrosse, Wis., on the 22d, the street railway employees were told that they must leave the union or give up their places. They chose the union, and went on strike.—In the case of the street railway strike at Scranton, Pa., Judge George Gray has announced the decision of the arbitrators, which grants an increase of 1 cent per hour to each of the four classes of workmen. The new rates will range from 21 to 24 cents. The strikers had demanded 25 cents for all classes.

Various Topics . . . At an election in San Francisco on the 24th, the people decided, by a majority of 403 in a total vote of about 20,000, against municipal ownership of the street railroads. The question was whether the city should issue bonds for the construction of an underground road in place of the surface road on Geary street, which is operated under lease from the city.—Charles R. Richardson, a broker, who was convicted of conspiracy in connection with the attempts to bribe Councilman Martin, of Pittsburgh, in the interest of a franchise for the Tube City Railroad Company, has been sentenced to be imprisoned one year and three months and to pay a fine of \$500.—General Holquin, acting as President in Colombia during the absence of President Reyes, has reduced the diplomatic

service to two legations in Europe, two at Baltimore and each in Baltimore, thus reducing annual expenses by \$8,000,000. He has also revoked the sentences of ex-communication pronounced by the Holy See against the French Panama Canal Company. President Roosevelt has been invited by the Government of New York, will go to Paris and examine the records of the French Panama Canal Company, to obtain information for use in the Government's libel suits against two newspapers. Some think that these suits will not be pressed.—The Senate has passed the House bill appropriating \$10,000,000 for taking the thirteenth census.—The 2-cent mileage law for railroads, enacted in Pennsylvania two years ago, has again been pronounced unconstitutional by a State court. This decision was in a case involving the Reading Company. The first decision was made when the statute was taken to the courts by the Pennsylvania Company.—It is reported that Congressman Sulzer, of New York, who recently returned from Guatemala, has procured there, for a syndicate of capitalists, a concession for the development of the unappropriated mineral resources of that country.

The Philippine Islands

Several companies of constabulary have been pursuing the mutineers who rebelled and attacked the American residents of Davao. Sergeant Academia, the leader of the mutineers, has been killed, and four of his companions have been captured. The revolt was due to a new commander's attempt to restore discipline, which had been relaxed under his predecessor.—It is reported that President Taft has decided to abandon Olongapo (in Subig Bay), as a naval repair station and war base, and to establish such a station on the shore of Manila Bay. There has been a controversy about Olongapo, the Naval General Board asserting that it is an ideal location, while the army engineers and artillery officers held that a station there cannot be defended adequately. The plan prepared for work there provides for the expenditure of nearly \$1,000,000.—Imports into the Philippines in 1908 were \$24,183,712, and the exports were \$24,561,207.

The principal imports were cotton goods, \$7,138,672 (less than one-tenth coming from this country), and rice, \$5,552,571. The islanders exported \$16,501,956 worth of hemp (about one-half of this going to the United States); \$6,058,886 worth of copra (only \$221,000 to the United States); sugar, \$5,703,641 (of which this country took one-third), and \$2,826,042 worth of tobacco and cigars, the value of receipts of these products in this country having been less than \$19,000.

Cuban Affairs

The Spanish Government holds, it is said, that while Spain's right to insist upon the assumption of a part of the Spanish Colonial debt by Cuba was not recognized in the Treaty of Paris, it was not denied in that agreement. There is now pending in the Cuban Congress a bill to increase by 30 per cent. the tariff duties on goods imported from countries with respect to which the balance of trade is against Cuba. Such an increase would seriously affect imports from Spain, and the Spanish Minister at Havana has protested against the proposed legislation. Some think the bill was introduced because of Spain's action concerning the colonial debt.—The lottery bill was passed by the Senate last week. It is expected that the lottery will yield a profit of \$2,000,000 a year to the Government.—It appears that Charles M. Schwab, of the Bethlehem Steel Company (which owns iron ore mines in Cuba), complained in several letters because arms for the new army were bought in Europe. President Gomez explained, it is understood, that the contract was awarded at auction to Señor Jose Lopez Pote, who chose to buy the arms in Germany and France.—Two Spanish newspapers protest with much indignation against the approaching visit of the United States gunboat "Isla de Luzon," bearing the Naval Reserve of Louisiana. This gunboat was captured from Spain in Manila Bay by Admiral Dewey, and has been loaned to Louisiana. Her presence in Havana harbor, the newspapers say, will be an insult to the Spanish residents, and the hope is expressed that she will sink in the deep sea.

British Politics At the closing of the meeting of the Imperial Press Conference, as at its opening, the demand for a larger navy was the principal topic of consideration. Admiral Lord Beresford declared that it was impossible to maintain the two-Power standard unless the dominions came in to assist. He said that each of the five nations of the Empire, Great Britain, Canada, Australia, New Zealand and South Africa, should have its distinct fleet to protect their trade routes. These would be maintained and controlled independently in time of peace.

"When it comes to war they must act under a great strategical bureau which should be at the Admiralty, but which isn't there now.

"There should be standardization, interchange of officers as well as interchange of ships, and repairing stations should be established thruout the empire.

"By some extraordinary mad infatuation for which I am quite unable to account, the repairing stations upon which we have spent so much money have been dismantled."

The fact that the Colonies recognize that the Empire is unprepared for war, as shown by their offer of Dreadnoughts, was the severest possible condemnation of the Government's policy of defense.—Opposition to the finance bill is becoming organized and outspoken. A meeting of a thousand persons prominent in financial and commercial circles was held in the city on June 23 to protest against the scheme of taxation proposed by the Government. Lord Rothschild presided and Lord Avebury and Sir Felix Schuster were among the speakers. The meeting resolved that

"The main proposals of the budget weaken security in all private property, discourage enterprise and thrift, and would prove seriously injurious to the commerce and industry of the country."

Some of the Liberals have joined in the protest against the bill in its present form. They, however, admit the right of the Government to levy a tax upon the unearned increment of land values, but believe that it should be 10 instead of 20 per cent. The Opposition has no expectation of preventing the bill from passing the House, but they hope that the House of Lords may put a stop to it, altho it is contrary to the British constitution for the Upper House to interfere with a financial measure. The Government bill for the establishment of labor exchanges

is, on the other hand, meeting with very little opposition. The debate on the second reading in the House of Commons was very tame and was confined mostly to a criticism of the expense of the project on the part of the Conservative members, and on the part of the Radicals of the liability, the expression of the fear that the exchanges might be used for transporting strike-breakers.—The labor members of the House of Commons have issued a manifesto protesting against the approaching visit of the Czar to England, altho he will not leave his yacht:

"We believe the visit is offensive to a great majority of the people of this country. We have no desire to interfere with the internal government of a foreign State, but when that Government is maintained by a system of murder and defends itself by putting to death or sending into exile its best and most virile citizens and when it suppresses the least whisper of liberty by hangmen, spies and blackguards of every kind it is an insult to our national good name and to our self-respect that our sovereign should receive in our name the head of such a State, especially when his personal approval of criminal agents has been placed beyond question."

—Two resignations from the Cabinet are reported, ostensibly on the ground of poor health, but possibly because of disapproval of the Government's financial policy. Lord Fitzmaurice, as Chancellor of the Duchy of Lancaster, is succeeded by Herbert Louis Samuel, Under Secretary for Home Affairs, who is thus promoted to Cabinet rank, and Thomas R. Buchanan, Parliamentary Secretary to the India Office, is succeeded by the Master of Elibank, Alexander William Charles Oliphant Murray.—Rudyard Kipling has joined in the attack upon the financial legislation proposed by the Government by a long poem in *The Morning Post* entitled the "City of Brass." The rulers of the City of Brass, by fomenting envy and penalizing thrift, weakened the city until it fell a victim to a conquering power. The following quotations will give an idea of its argument and rime:

They said: Who has hate in the soul? Who has envied his neighbor?

Let him arise and control both that man and his labor.

They said: Who is eaten by sloth? whose unthrift has destroyed him?

He shall levy a tribute from all because now has employed him.

They said: Who has toiled? Who hath striven and gathered possession?

Can him be spoiled; he hath given full proof of
 The eaters of other men's bread, the exempted
 from hardship,
 The excusers of impotence fled, abdicating
 their wardship;
 For the hate they had taught thru the State
 brought the State no defender,
 And it passed from the roll of the nations in
 headlong surrender.

German Finance Bill. Chancellor von Bülow is engaged in a course similar to that of Premier Asquith, but he is having a harder time of it for altho the German finance bill is less radical than the British, the opposition is greater. The British Prime Minister has still a substantial majority back of him while in Germany the "Bloc," which has hitherto supported the Government is disintegrated and the Government has been defeated more than once in test votes on various clauses of the bill. The alignment of the parties in the Reichstag is remarkable. The Conservatives, Centrists, Poles, Alsations and Independents form the Opposition, while the Imperial Conservatives, National Liberals, Radicals and Socialists support the Government's finance policy. In presenting the new taxation proposals to the Reichstag on June 16, Prince Bülow stated that he had no political animus against any party. He had not been influenced by the members of the Clerical center, who had made bitter personal attacks against him, charged him with disloyalty, and carried their dislike so far as to break off social relations with him. He would accept support from any party, even from the Socialists, if only they abandoned their purely negative attitude and dogmatic intolerance. The Conservatives would wait a long time before they got another Chancellor who represented so consistently and so successfully the great and permanent interests of the Conservatives. But the Conservatives damaged their own cause when they did this. It was utterly impossible to raise all the necessary new taxation by indirect impositions. There must be a property tax of some kind and the distribution of the only practicable property tax at present the Federal Governments must stick to it. He concluded by saying:

"I regard nothing in domestic politics as of equal importance with the early accomplishment of finance reform. I subordinate myself entirely to this great task. If I believed that I were a hindrance, or that somebody else could reach the goal more easily, or if the situation developed in a direction in which I neither could nor would co-operate, I should be able to convince the wearer of the crown of the advisability of my retirement."

The clause to which the Conservatives most strongly object is that extending the inheritance tax to legacies bequeathed to husbands or wives and children. The tax is levied only on estates over \$5,000 and on bequests to a single individual of more than \$2,500. Beginning with a tax of 1 per cent. upon an estate of \$5,000 it increases to 4 per cent. upon \$187,500. The proposed tax on fire insurance policies is defended by the Government as a genuine and evenly distributed tax upon property. The Finance Committee of the Reichstag rejected the proposal to levy an inheritance tax upon direct heirs and when the question was brought up in the Chamber it was voted down by 194 to 186. The Opposition, not contended with negative criticism, proposed as alternatives to raise the necessary money by duties on stock transfers, the output of the mills and exports of coal. The Government opposes these because it would interfere with trade and drive away foreign securities. Herr Delbrück, the Prussian Minister of Commerce, emphasized the following point:

"We need ships and bayonets, but they must be paid for and especially at the moment when we are making war. We have the necessary means only if we have a position in the international market, if we have claims on foreign countries. Our position will be considerably strengthened if we hold a large quantity of foreign securities."

Nevertheless the proposal to impose an annual tax on bonds and stocks was adopted by 203 votes against 155. The tax is to be calculated on the basis of the average quotation for the preceding year, and the rate of interest on this amount which the current dividend yields. The tax will then be deducted by the companies from the dividends before payment. Prince Bülow has announced his intention of retiring from the chancellorship as soon as the finance bill is disposed of, whatever its fate.

—In a speech at a dinner on the occasion of the "North German Regatta" the Emperor referred to his recent meeting with the Emperor of Russia in the following words:

"Czar Nicholas and I agreed that our meeting is to be regarded as a vigorous reinforcement of the cause of peace. We feel ourselves as monarchs responsible to our God for the joys and sorrows of our respective peoples, whom we desire to lead forward as far as possible on the path of peace and to raise them to their full development. All peoples need peace in order under its protection to fulfil undisturbed the duties of civilization for their economic and commercial development. We will both therefore continually endeavor, as far as lies in our power, to work with God's help for the furtherance and maintenance of peace."

Turkish Affairs The Albanian rebellion is causing serious trouble to the Turkish Government. The mountain passes near Petch or Ipek, which is 73 miles north-east of Scutari, are occupied by a force of Albanians, said to number altogether 14,000, and the repeated efforts that have been made by the Turkish troops to dislodge them have failed. Djavid Pasha, who is in command of the Turks, made three attacks upon the pass on June 16, and was driven back with considerable loss. He was forced to retire to Djakova, 20 miles northwest of Prizrend, abandoning part of his artillery. A week later he made another attempt with three regiments of Turkish infantry and was again repulsed, losing fourteen officers and 350 men, killed and wounded. Among the killed was Kiamil Bey, a prominent leader of the Young Turks. Fresh troops have been ordered from Monastir to the front. The Albanians demand autonomy and the liberation of all prisoners. Prince Ghika, pretender to the Albanian throne, is said to be leading the insurgents.—The Cretan question has not yet been settled, and there are rumors of military activity on both sides of the Greek frontier. It is not known whether the four Powers which form a protectorate over Crete have to come to an agreement to postpone the evacuation which had been set for July, but in case the evacuation takes place according to the program four foreign naval vessels will remain in Cretan waters and the

Powers will guarantee the maintenance of the *status quo* for one year after the evacuation. The Cretan Mohammedans who are members of the Turkish Chamber of Deputies have protested that warships cannot take the place of troops, and that if the protectorate of the Powers is removed the Mohammedans would be subjected to acts of violence and oppression by the Cretan Christians, and that deputies would be sent to Athens asking the Greek Government to declare the annexation of Crete. In reply to this criticism Rifaat Pasha, Minister of Foreign Affairs, explained that the Government was determined to safeguard Turkish rights in Crete and that these rights were contested by no Power.—Mohammed V, the Sultan of Turkey, will endeavor to compensate for his lifelong imprisonment by his brother in a tour around the European capitals next fall, arriving in England in December. He will also visit Northern Africa.

Moroccan Difficulties Mulai Hafid, the new Sultan of Morocco, is not having any easier time of it than his brother whom he deposed. He is ill in his palace at Fez, he has quarreled with Spain, rebellions are breaking out in various parts of the country, and his supporters are deserting him. The pretender, Bu Hamara, who has for years waged a desultory warfare against the Sultan, whoever he might be, is becoming bolder and has burned loyal villages within sight of Fez. The Sultan's brother, Mulai Kebir, also in revolt, is marching on Mekinez at the head of the Zemmour tribesmen with whom he has allied himself by taking as a wife a daughter of one of the chief men of the tribe. The domineering and irritable disposition of the Sultan has alienated his most able viziers. He has notified Spain that he will have nothing more to do with the Spanish Minister, Merry del Val, who has tendered his resignation to his Government. This, however, is not likely to be accepted since he has only obeyed instructions in demanding of the Sultan a monopoly of fishing rights and concessions for public works on the Rif coast and in refusing to promise the evacuation of Cabo and Agua Marchica by the Spanish.

UNIVERSITY of WISCONSIN

by
EDWIN E. SLOSSON

IT is impossible to ascertain the size or location of the University of Wisconsin. The most that one can say is that the headquarters of the institution is at the city of Madison and that the campus has an area of about 56,000 square miles. All of the people in Wisconsin, not to mention other States and foreign countries, are eligible as students, and a very considerable proportion of them do receive instruction from the university in one form or another. How many nobody knows. It is equally impossible to answer intelligibly such easy questions as what is the length of the course, where are the laboratories, and how many books are there in the library. The length of the course varies

from ten days to ten years. The laboratories are wherever there is machinery in action, industrial or social, with which the students care to experiment. If we go into a local electric light and power plant in any part of the State we may happen upon a group of advanced students making an investigation of it. A student in accounting is going over the books; a student in hydraulics is determining the efficiency of the water power; a student in electricity is testing the dynamos and lights; and a student in sociology is studying the wages and condition of labor in the plant and associated factories. Their reports, carefully worked out in the office of the Commissioner of Railroads, form part of the system by which the State watches over all its public service corporations, and may be used as theses in the

United American Universities—How is the world? It is busy as well as in the present condition and future prospects of the larger universities of the United States by one of the editors of *The Democratic*. The dates of publication of these publications are follows:

1. Harvard University	Jan. 7th, 1900	8. University of Minnesota	Aug. 5th, 1900
2. Yale University	Feb. 4th, 1900	9. University of Illinois	Sept. 2d, 1900
3. Princeton University	March 4th, 1900	10. Cornell University	Oct. 7th, 1900
4. Stanford University	April 1st, 1900	11. University of Pennsylvania	Nov. 4th, 1900
5. University of California	May 1st, 1900	12. Johns Hopkins University	Dec. 2d, 1900
6. University of Michigan	May 20th, 1900	13. University of Chicago	Jan. 6th, 1901
7. University of Wisconsin	July 1st, 1900	14. Columbia University	Feb. 2d, 1901

university. There is a triple advantage. The State gets for little or no money the services of a number of honest and well-trained investigators, on their mettle to make a reputation for good work, for by it they may secure a position in State or private service. The local corporation welcomes them because its plant and system gets a thoro overhauling, and the inspectors are often able to point out leaks and wastes and to suggest where it would pay to call upon an engineer to make changes. And the students gain the inestimable advantage of being engaged in something worth while on which more depends than a good mark or a teacher's reprimand. The thirst of adolescence for real work and impatience with shams and playthings of all kinds should be recognized and utilized in our educational system.

The library of the University of Wisconsin is as hard to define as the laboratory. To count the books is like counting the little chickens around a coop; they run in and out too fast. It borrows rare books and files of old newspapers needed by research students and is equally ready to loan to other libraries and universities inside and outside the State. It is different at Oxford, where it requires a formal vote of the Vice-Chancellor and ten college heads, professors and M. A.s, to get a book out of the Bodleian Library.

Nobody can tell exactly what are the limits of the library. There is a big building between the two capitols, or, rather, between the capitol and the university, which is always open and always full of students. If there is any truth in the saying that you can take the pulse of a university in its reading room, the University of Wisconsin is in fine, healthy condition. The building was put up only eight years ago, at a cost of \$610,000, but it is already overcrowded, for the library has increased in size since then by 120 per cent. It is still not large, about 135,000 volumes, including departmental libraries, which gives Wisconsin eleventh place in the matter of books among the fourteen universities considered in these articles. But in the same building with the main university library and practically forming a part of it are the libraries of the State Historical Soci-

ety and the Wisconsin Academy of Sciences, Arts and Letters, which more than double the number of volumes. This is not all, for Wisconsin has a well-organized system of free libraries, which are closely connected with the university.

There are about a million volumes in the school libraries alone, and nearly as many more in the 156 public libraries. Then, to meet the needs of localities and individuals not adequately supplied by the public or the school libraries, there are the traveling libraries, which circulated last year 122,093 volumes, a larger number than any other State circulates in this way. When I was in the office of the director of university extension, he told me of an application he had recently received from a young man in the backwoods in the northern part of the State, who wanted to take a course in history under the direction of the university. I asked what he could do for books, and the director answered that he had just telephoned to the secretary of the Free Library Commission to send him out a box of twenty-five volumes. The public libraries are becoming secondary centers for the radiation of university influence; thru them books will be supplied to study classes all over the State and the work of the correspondence students watched and guided. The State Library School joins with the university in giving a combined college and library training course, and the students in their closing year are sent out into the libraries of Wisconsin for "field practice." Now the Library Commission and the local libraries are independent of the university, and that is the most interesting thing about the Wisconsin system, the way the various educational and administrative departments work together in harmony, whatever may be their official relationships. It is very confusing to the inquisitive stranger who wants to confine his attention to the "university," and not have to go into the political, social and industrial life of the whole State.

It would be, of course, possible to leave out of consideration all the things that the University of Wisconsin is doing and the traditional university is not; to lop off the summer session, the artisans' courses, the institute work, the govern-

mental functions, the correspondence ~~of the~~ the experimental station (the dairy school), the stock judging, and all that sort of thing, thus trimming down the university until it is comparable in size and function with other universities, but if we do that we have left a bleeding stump, not at all the real University of Wisconsin, which is like a living tree spreading its branches and roots throughout the State in indefinable ramifications. Therefore I shall not attempt to confine myself to what some would call "the university proper." The State university properly includes all that the State is doing for the higher education of its people, and it is the glory of Wisconsin that it is interpreting this definition in the widest sense.

The government of a Western State has four parts—executive, judicial, legislative and educative. But these are not distinct, and in the development of the system the fourth is as closely connected with the other three as they are with each other. The aim of some State universities is to keep out of politics. The University of Wisconsin is in politics and feels that it belongs there, not in the sense of being a football of opposing parties or attached to the fortunes of a political boss, but as taking an active part in administrative work and in guiding the policies of the State. In some States the president of the university only goes to the Capitol once in a biennium to beg for his allowance, in company with the representatives of the other charitable and penal institutions. The faculty also religiously keeps away, except perhaps the professor of political science may take his class in civics into the gallery of the House of Representatives to show them "how the laws are made." But in Wisconsin professors may be seen almost any time in the Capitol, ~~not working the officials on budget~~ appropriations, but working with the officials for the good of the commonwealth.

The main building of the university is of the stately domed type characteristic of the American capitoline order of architecture. It looks so much like the State House, which stands on the next hill, that a stranger might easily mistake the one for the other, and it would not be a serious blunder if he did. That it

makes it harder to find a professor than where he confines his beat to classroom and study. When I inquired at the university for Prof. Balthasar H. Meyer I was told that he was at the Capitol, presiding over a meeting of the State Railroad Commission. When I had walked over to the Capitol I was informed he was conducting a seminar at the university. I tried to find Dr. McCarthy in the legislative-reference room at the Capitol, and they told me he was on the campus assisting in the coaching of the football team.

I started in to get a complete list of all the members of the faculty who were doing public work of some sort in an official capacity, but I had to give it up, for the list became too long to print before I had found them all. The list I obtained, however, had the names of forty members of the instructional force who were filling administrative or advisory positions in the State or Federal service. Among them were the following: State Geological and Natural History Survey, Free Library Commission, State Forestry Commission, Conservation Commission, State Fish Commission, State Park Board, State Board of Health, State Board of Control, State Tuberculosis Sanitarium, State History Commission, State Live Stock and Sanitary Board, State Hygienic Laboratory, State Railroad Commission, State Board of Assessment, State Sealer of Weights and Measures, State Butter Makers' Association, State Board of Agriculture, United States Reclamation Service, United States Geological Survey, Legislative Reference Library, United States Conservation Commission, etc.

This shows how far Wisconsin University has departed from the old-fashioned ideal of scholarly aloofness and sequestration and is taking what appears to be its ultimate function, that of a bureau of experts to the State Government. It should be recognized that a State university is not doing its full duty unless it serves the people, both officially and unofficially, as a general information office, to which they can apply for the technical and scientific knowledge needed in their daily life and work.

As will be seen from the above list, the offices held by members of the fac-

ulty are mostly those classed as non-political positions; that is, they carry with them little money, prestige or party power. They are, however, positions of usefulness and responsibility, those in

interchangeable officeholder cannot run everything satisfactorily by his intuition and common sense. The line that used to be sharply drawn between the scholar and the man of affairs, between those

CHARLES RICHARD VAN HISE,
President of the University of Wisconsin.

which the general public is beginning to realize that some special proficiency and training are required. Such positions must increasingly predominate as our political system becomes more complicated, and it becomes apparent that the old-fashioned, American, all-around,

who knew a great deal and could not do anything and those who had to do everything and did not know much about it, is being wiped out in Wisconsin.

Under the influence of university men Wisconsin has become the recognized leader in progressive and practical legis-

lation, the New Zealand of the United States. But I am here concerned with the other side of the question, the effect upon the university of this active participation in the affairs of the outside world.

There is no denying that, for one thing, it increases the respect of the students for a professor when they find that he is able to do the things he is teaching, that he is looked upon as an authority even when he gets off the campus. Young people sometimes get the idea, among the other strange notions

ly hidden within the faculty circle, but is known to the outside world, always too ready to suspect college professors of inefficiency, and the university suffers in consequence. A State university like Wisconsin is set upon a high hill, watched from all quarters by friendly and unfriendly eyes. Its defects are conspicuous and swiftly penalized. This I believe to be a wholesome influence, in spite of the fact that the standards by which the outside world judges university work are frequently incompetent

READING ROOM OF THE LIBRARY

that come into their heads, that a professor may have chosen the quiet life of the scholar not so much because of his superiority to the world as because of his inability to cope with it.

Then, too, the fact that members of the faculty will have an opportunity to become leaders of men as well as teachers of youth makes the authorities of the university more careful in the selection of its instructors. If a man is a failure, if he does not have ability as well as knowledge, the fact cannot be kept safe

and unfair. For the college professor, as a rule, is too much sheltered from criticism and competition. Good teachers and poor teachers, men who stimulate their students, those who depress them, and those who do not influence them at all, have thruout their lives the same rank, reputation and salary. There are no tests of efficiency applied to classroom work, and the president of a university has no way of finding out definitely which are his good teachers. If an instructor hands in unusually high marks

or low marks, if he "flunks" 60 per cent. of a class on examination, if his electives are overcrowded, if he is popular or unpopular with students and faculty, it may mean that he is an exceptionally good teacher or quite the reverse. That is one reason why so much stress has been laid on research in the gaining of position and promotion. It provides an objective test by which all the men working in the same lines may be ranked with remarkable exactness. Administrative and advisory work outside the university provides a similar test of a somewhat different kind of ability. The old-fashioned college was composed mostly of teachers. To these were added during the last generation investigators. Now there are coming in a third class of men, who are largely occupied with professional work in a public or private capacity. That is, the university of the future will be composed of three classes, men who have the genius for discovering truth, men who are especially adapted to imparting it to others, and men who are successful in showing how it may be applied to the problems of life. It is unfortunately rare to find these three forms of ability equally developed in the same individual, so the next best thing is to bring them together in the same faculty, where they mutually strengthen each other and give the institution as a whole an unprecedented power in the community.

It must not be supposed that this third or utilitarian function was voluntarily adopted by the universities because it completes their educational effectiveness. On the contrary, it was forced upon them by the outside world, and many universities yet pride themselves on the degree with which they have resisted that pressure and maintained "the old-fashioned college in all its purity." The utilitarian departments were generally added from the most utilitarian of motives, because it brought more money to the support of the university. The most extensively developed of these departments, the agricultural experiment station work, was begun thruout the country generally in a faint-hearted way. Many of those who were engaged in it in the early days of the movement had little faith in its practical value, and the work

they turned out was apt to be of a sort to justify their skepticism. But they were gradually replaced by men of faith and enthusiasm, and finally faith became unnecessary, for it was proved arithmetically that such work paid, not in any remote or hypothetical sense, but literally and directly. I ascribe the prosperity of the agricultural department of the University of Wisconsin largely to the fact that it was the first to furnish an irrefutable demonstration of this in milk-testers invented by Prof. S. M. Babcock, chief chemist of the station. This, by giving a cheap, quick and accurate method of determining the amount of butter-fat in milk, has revolutionized the creamery business and the breeding of cows. The test for the amount of casein in milk recently invented in the Wisconsin station and the new methods of cheese-making there developed are expected to do as much for making that industry scientific, economical and profitable as has been done for butter-making. When a university can prove that it has added several millions a year to the income of the people of the State, as the University of Wisconsin can, there is no difficulty about its appropriations. The only question asked by the Legislature is how much more money can it profitably employ.

I find there are two ways of making a Wisconsin man mad. One is to call the university "the Harvard of the West" and the other is to call it "a utilitarian university." Which remark will produce the desired reaction depends on the particular student experimented upon. One who resents the first remark does not mind it so much if Harvard is alluded to as "the Wisconsin of the East," for he has hopes that Harvard may in time come to deserve it now that it has added departments of applied science, in which a use is found for everything, including Münsterberg. Wisconsin men have had a special liking for Harvard ever since last June, when President Van Hise received from Harvard the degree of LL.D. as "president of the leading State university." The remark was made in Latin, the customary dialect of the Harvard Yard, but, with their usual enterprise, the Wisconsin men found out what it meant in a marvelously short

time, and seem to be pleased by it, altho that is queer, because it was nothing more than they knew before.

The aversion to the word "utilitarian" on the part of some of the faculty and students arises from the fact that those who undertake to "write up" a university, including, of course, the present writer, naturally devote most of their attention to its peculiar and original features, and the University of Wisconsin has certainly been distinguished by its agility in discovering new ways of making itself useful to the people who support it.* But the reader must always bear in mind that such a view misrepresents a university as a newspaper misrepresents the events of the day by ignoring the doings of the peaceable and undistinguished citizens who form the most important part of the community, as peaceable and undistinguished teachers and students form the most important part of every university.

As an aid to the acquisition of a well-balanced view of the University of Wisconsin as a whole, let me say that, considering only the main departments, about half the students are in the College of Letters and Science, and the other half divided equally between the

College of Engineering and the College of Agriculture. The distribution of graduate students gives the relative strength of departments perhaps better than any other numerical test. These number nearly 250 and are divided equally between the humanities and the sciences. Of the former group, about half are doing work in the linguistic departments and half in the historical and political departments. Of the scientific graduate students, about one-third are working in the biological and two-thirds in the physical sciences. It will be seen from this that Wisconsin is not an ill-proportioned university.

I express the opinion in an earlier article that the core of the American university of the future would be the group of studies now vaguely defined as social, political and historical, because these occupy the central position in the curriculum, midway between the sciences and humanities, and include the best of each, by applying the methods of exact science to the study of man. They have, therefore, or can be made to have both cultural and vocational advantages of a unique order. In the University of Wisconsin this group of social studies seems to be assuming this central and dominant position, and it is interesting to watch its rapid expansion and projection into new lines. It was in this department that the specialized graduate research work of the university was first started, when Prof. Richard T. Ely went to Madison in 1892, bringing with him the motto over

*Mr. E. C. Corbin, late of the University of Wisconsin, has written an article in the *Independent* entitled "Which College for the Boy?" Mr. Corbin, as a Harvard and Oxford man, looks at things from a different standpoint, so reading his articles in connection with these will give something of a stereoscopic effect of reality. Attention should also be called to the article by Mr. Lincoln Steffens on the University of Wisconsin, entitled "Sending a State to College," in the *Atlantic Magazine*, March, 1900.

ENROLLMENT OF STUDENTS BY COLLEGES AND SCHOOLS IN THE UNIVERSITY OF WISCONSIN 1888-1908.

Year.	Letters and Science.	Eng.	Med.	Agr.	Eng.	Pharm.	Music.	Summer school session.	Total.	Total.
1888-89	135	80	—	46	100	40	301
1889-90	141	101	—	52	100	41	335
1890-91	150	107	—	57	108	46	361

1903-04	150	100	—	57.3	200	47	354.3
1904-05	150	100	—	57.3	200	47	354.3
1905-06	150	100	—	57.3	200	47	354.3
1906-07	150	100	—	57.3	200	47	354.3
1907-08	150	100	—	57.3	200	47	354.3
1908-09	150	100	—	57.3	200	47	354.3

Enrollment figures for the year 1908-09 are not yet available.

the library door of Johns Hopkins, "History is past politics, politics is present history." But a man who takes such a revolutionary view of an academic study and who prefers to make his researches in political economy outside his library, cannot expect to be regarded, like other college professors, as a harmless innocent, so it is not surprising that Professor Ely soon became an object of suspicion. He was accused—this was in 1894, but it seems longer ago—of several heinous crimes, such as having entertained at his house a walking delegate. He was able to prove an alibi on this charge, and the Board of Regents not only vindicated him of incendiary utterances, but took occasion to express the fundamental principle of the university spirit in words that should be

THE DISTRIBUTION OF STUDENTS IN THE UNIVERSITY OF WISCONSIN, 1907-8.

THE NUMBER OF STUDENTS IN THE UNIVERSITY OF WISCONSIN FOR THE LAST TWENTY YEARS.

quoted for the benefit of other institutions, or of the University of Wisconsin, in case the fight for free speech should ever have to be fought over again;

"Without doubt some things may have been written not only on social economics, but also on history, hypnotism, geology, psychology, education and law, with which many good people could not agree. We cannot, however, be unmindful of the fact that many of the universally accepted principles of today were but a short time ago denounced as visionary, impracticable and pernicious. As regents of a university with over one hundred instructors, supported by nearly two millions of people who hold a vast diversity of views regarding the great questions which at present agitate the human mind, we could not for a moment think of recommending the dismissal or even the criticism of a teacher even if some of his opinions should, in some quarters, be regarded as visionary. Such a course would be equivalent to saying that no professor should teach anything which is not accepted by everybody as true. This would cut our curriculum down to very small proportions. . . . Whatever may be the limitations which trammel inquiry elsewhere we believe the great State University of Wisconsin should ever encourage that continual and fearless sifting and winnowing by which alone truth can be found."

The establishment of this principle soon after the school of economics was started accounts in large part for its prosperity and repute, for it opened the way to the free investigation of living questions, such as labor unions, taxation, corporation finance, insurance, and public utilities. The library is exceptionally rich in the material for investigation in these lines, and is the center of activity of the American Bureau of Industrial Research and of the American Association for Labor Legislation. On account

of their training in practical affairs, the graduates of Wisconsin have always been in demand. A list of those who have taken Ph.D. in economics, 1892 to 1907, gives the names of twenty-six men and women who now occupy professorships in universities from Cambridge to Tokyo, or positions of similar importance in the public service.

The increase in number of State commissions for the investigation or regulation of transportation, banking, insurance, water power, forests, sanitation, factories, etc., as well as the extension of the functions of municipal and national governments and the establishment of philanthropic and reform endowments, opens fields for employment for a new class of business experts. The duty of preparing men for such work falls naturally upon the State universities, but they have mostly neglected it. So, too, have the universities of all kinds failed to provide training adequate for the magnitude and complexity of modern corporate and private business operations, altho many of their graduates are predestined to this profession or what should be a profession. Wisconsin established a college course in commerce in 1900, being the first to enter this field, with the possible exceptions of Pennsylvania and California. The course covers four years and requires two foreign languages. There is also a combination engineering and commercial course of five years. The commercial museum is in a rudimentary state, poorly housed and having no apparent connection with the closely related collections of the departments of agriculture and geology.

The inclusion of *reconstruction* into political economy and the allied departments seem to me to have a good effect. As taught in Wisconsin it could no longer be appropriately called "the dismal science." On the contrary, it is distinctly idealistic and inspiring, creative rather than critical. These young men are being taught narrowly to study history, but to make it. They have no intention of being statisticians all their lives; nor do they look upon themselves as reformers in the usual sense of the word. If the social sciences as taught in Wisconsin have lost in thoroughness and fairness, they have gained in the at-

titude of a Martian. I am not competent to detect it.

The spirit of the University somehow makes itself felt even in the formal language of the catalog, as may be seen by quoting a few characteristic courses:

25. *Seminary in Social Psychology*. A study of the nature, extent, varieties, and effects of contemporary wrongdoing, especially in politics and business, and an inquiry as to how far the phenomena may be explained by changes in American life and society. *Second semester; W., 7:15 to 9:15.* (Omitted in 1909-10.) Professor Ross.

30. *Administration of Punitive Justice*. This course will deal with the methods of discovery, prosecution and punishment of crime; the functions of the police, prosecuting officials and jury; and defects in the administration of criminal laws. The technical parts of criminal law and procedure will not be treated, but the study will be from the point of view of the student of political science. *Second semester; Tu., Th., at 10.* Associate Professor Scott.

26. *The Theory and Practice of Legislation*. A study of the methods of procedure of legislative bodies, and the preparation of the subject matter and form of bills. The legislature is in session from January to June, in the odd-numbered years. *Throughout the year; M., W., F., at 12.* Dr. McCarthy and Mr. Hornbeck.

42. *Public Utilities*. A comparison of public regulation and public and private ownership of municipal utilities in American States and foreign countries, including constitutional and judicial limitations, delegation of legislative power to commissions, physical valuation, reasonable rates and service, organization of public employees, cost, efficiency, social and political results. *First semester; lectures, M., W., F., at 8.* Professor Commons and Mr. Dudgeon.

49. *Contemporary International Politics*. A course of weekly lectures on questions of international or foreign politics which are of special importance at the present time. May be elected in successive years as subject matter is changed annually. *Throughout the year; W., at 5.* Professor Reinsch.

45. *Exploitation of Natural Resources*. A critical study of some of the special problems of conservation and reclamation in the United States. The economic aspects of Federal and State policies pertaining to public lands, forests, irrigation, drainage and waterways, the relation of property rights to conservation. (This course is designed to follow and complement the course in natural resources, offered during the first semester to President Van Hise.) *Second semester; Tu., Th., at 9.* Dr. Hess.

1. *Agricultural Journalism*. The lectures treat the nature and technique of posting, history of agricultural journalism, survey of the present agricultural press, classes of agricultural writing, reporting of farm stock and

corn shows, technical writing, and photography for the press. The exercises will include practice in the preparation of articles of the various classes, editing, proofreading, reviewing, interviewing, preparation of special articles, etc. *Second semester, two unit hours.* Mr. Marquis.

The last item is significant of two new tendencies manifested in Wisconsin and similar institutions, the introduction of journalistic training and the extension of the sway of the English department into the technological schools. In the University of Wisconsin journalism has now developed into a regular four years' course with laboratory work provided by the numerous official and unofficial periodicals. The *Alumni Magazine* offers a graduate fellowship and the *Daily Cardinal* several undergraduate scholarships. Journalists in general are as doubtful of the practicality of collegiate training for their profession as lawyers used to be of the value of law schools or farmers of agricultural colleges, but in spite of this natural and, on the whole, beneficial skepticism, the experiment is going to be tried in many places. Columbia University five years ago received a million dollars from Mr. Pulitzer of the *World* for the endowment of a school of journalism, but it has not yet been put into commission.* At Harvard it is proposed to establish the *Veritas*, a periodical which shall differ from all others in that it will contain only truthful statements. The daily published by the school of journalism of the University of Missouri proved so profitable that the Legislature intervened in accordance with the good old American principle that nothing run by the Government shall be allowed to pay. It is in accordance with this principle that a State's prison is deprived of its industries whenever it becomes self-supporting; that the postal service is not allowed to enter the profitable branches of its business; that the Patent Office is criticised if it shows a balance on the right side; that the *Bulletin of American Republics* was deprived of its advertising because it persisted in turning in money to the national treasury instead of taking it out; and the Panama hotels are com-

pelled every year to "blow in" their surplus on extras. The rigid enforcement of this rule is rightly felt to be the only effective way of checking the tendency to extend governmental activities into industrial lines. I notice that the creamery of the University of Wisconsin is careful to limit its business so as to keep a small deficit. This is wise, for if it became profitable it would probably be suppressed.

The development of technical journalism is an important movement, because there are more periodicals of this class than of the purely literary, and they have more influence on the people. Assuming that it is possible and proper for a university to train men for any vocation, here is one that should not be neglected, for high ideals and wide scholarship can make themselves felt in the editorial chair of a trade journal as they can in a pulpit, for which the college used to train its men. The splitting of the old college into literary and scientific sections and increased specialization in both directions had a curious effect on the students. One set were taught four or five languages, but did not have much of anything to say in any of them. The other set were crammed with facts, but were left without the power of expressing them intelligently. Now both wings of the faculty are coming to a realization of the need of getting for their students a little more of what is given to the other set, tho, since the lack of words is a more conspicuous defect than the lack of ideas, the scientists are more keenly aware of the deficiencies of their form of education than are the humanists, and in various ways they are striving to remedy it. In Wisconsin one of the professors of English is assigned to the duty of superintending the scientific and technical students in the writing of their theses and special reports, working with them individually and in small groups. There are special courses for the teaching of the various sciences, and in agriculture particularly the students have ample opportunity for acquiring the art of presentation in writing and speech. In fact, the task which has fallen upon the agricultural colleges to train thousands of adults in the use of

*An interesting discussion by Mr. Pulitzer on what can and cannot be taught in such a course may be found in the *North American Review* for May, 1904.

scientific terms and in the application of scientific principles—an educational undertaking unprecedented in the history of the world—has developed a new style of expository literature, of which the best representatives are the bulletins of the Wisconsin and Cornell Experiment Stations. The young man who was called upon to stand before a class of farmers of untrained minds and unductile dispositions and to demonstrate the relative value of nitrogenous and phosphatic fertilizers or explain the calculation of the nutritive ratio in stock feeding, was compelled to strike new methods for himself. "He had to!" At first the professors used to tell the farmers about tuberculosis in the cattle. As this did not produce any impression, they used pictures, then lantern slides and colored models. Now they pick out an animal from a herd by the tuberculin test, bring it into the amphitheater, slaughter it, and cut it open before them. This is true pedagogy. I have been told by several persons who had reason to know that forcible and effective teaching is more common in the Western universities than in the Eastern, and the explanation given of this was that the students of the West were, on the whole, less well prepared and that the agricultural and other forms of extension work forced certain departments to give greater attention to the matter of the presentation of a subject. Other departments, thru the competition of the elective system, were compelled to adopt similar methods, until finally the enlivening influence was felt in the common classrooms. In the same way as I explained to talking of Princeton, the humanistic professors have been obliged to increase their office practice to correspond with the individual attention given to students in the scientific laboratories.

The average male Freshman of the University of Wisconsin is nineteen years and seven months old. He weighs 177.4 pounds and he is 5 feet 2.7 inches high. He was probably born in Wisconsin, and his father is more likely to be a farmer than anything else. Thirty per cent. of the entering class and sixty per cent. of the graduating class are of foreign parentage. This indicates that foreign blood is more persevering or less

enterprising than American or something else. Half of the foreign fathers, in the case of both classes, came from Germany; next in number are those from Norway or the British Isles.

What the interests of the students are, outside of their class work of course, may be shown by their societies, for in America, and especially in the West, nothing much is done without a constitution and an executive committee. According to the last *Badger* there are 130 organizations, including three dramatic, four musical, eight oratorical, eleven press and publications, twenty-five athletic, twenty-three fraternities exclusive of the eleven sororities and three professional fraternities, seven honor societies, five class societies, three special women's organizations, three military, and twenty-four general university clubs such as the medical, socialist and Christian associations.

In comparison with the undergraduate activities of an Eastern university the most striking feature of this list is the popularity of oratory and journalism. In most institutions East and West the fraternities on the one hand and the departmental clubs on the other have sucked the life out of the old literary societies, but in the University of Wisconsin they still thrive. Two of them, *Athena* and *Hesperia*, have been for over fifty years in the university, and they are not yet ready to retire on a Carnegie pension. The students who are selected to represent these societies or *Philomathia*, in the annual joint debate, choose the subject in the spring, so the summer can be spent in working it up. Even then their studies in the fall term are apt to be neglected. The faculty had to put a time limit on the preparation, otherwise the subject would have been picked out a year ahead. The debate is printed by the university and sent to all the libraries and high schools in the state. Besides the intracollegiate debates, the University competes with Illinois, Iowa, Minnesota and Nebraska, in debating, and with Chicago, Iowa, Michigan, Minnesota, Northwestern and Oberlin in the Northern Oratorical Contest.

In connection with the student organizations mention must be made of the *Congregational Club*—large the Wisconsin

club claims the honor of being the oldest, as it was started in 1903, and has led in the organization of those clubs into a national association which now has a membership of about 1,500, representing fifty different countries.* Wisconsin has had a close rival in Cornell from the beginning, and it is a question to be decided in the near future which of them will be the first to build an international clubhouse.

Each of the local clubs is composed of practically all of the foreign students in the university together with a limited minority of Americans, and the remarkable thing about the movement so far has been the spirit of toleration and fellowship which has kept these diverse elements in harmony. For the foreign students are proud and sensitive and as alien to each other as to the Americans. But youth is the time and the college is the place in which hot discussion and mutual chaffing are promotive of friendship, and it is not extravagant to anticipate that in later years, as some of these men come to discuss the same questions in earnest, they will carry something of the spirit of the clubroom into the diplomatic chamber.

Last month in speaking of the University of Michigan I called attention to the changed conditions which had forced the State universities to pay more attention to the life of the students. Since it has become fashionable, even in the upper classes, for parents to send their boys and girls to college, there has been an increase in the athletic and society sets. The fraternities year by year set a higher standard of expenditure, which, tho still modest compared with that of Eastern colleges, is sufficient to fix a gulf between the richer and poorer students.

In Wisconsin the efforts made by the university authorities in the last few years to look after the social and athletic affairs and the housing of students aroused some natural resentment among the students, and in this they had the sympathy of such of the faculty who cling to the old *laissez-faire* ideals. It is an unsettled question whether the so-

cial cleavage of the university can be prevented anyway. What is the use of faculty and students struggling with the question of whether tickets to the Junior Prom shall be \$3 or \$5, when this is only a small part of the expense involved in the affair? Whenever social entertainments become at all elaborate then the principle of competitive expenditure, which is the basis of fashionable society, comes inevitably into play, and what equality can there be between a student who spends a hundred dollars on his week-end girl and one who has only twice that for his year's expenses? It might be better policy frankly to abandon such social functions to the fraternities and those who adopt their standards. Their aim in raising the scale of expenditure is of course to make them more exclusive, and the more fully they accomplish this aim the better it is, in my opinion, for the rest of the university.

There is among the young men of the University of Wisconsin as yet very little of that snobbishness prevailing in Cornell, Columbia and Harvard, which consists in looking upon the young women in the university as their social inferiors and unfit associates. The fact that in Wisconsin, as in Michigan and elsewhere, there is a tendency to import girls for the Junior Prom and similar occasions, does not seem to me to contradict this statement. It is, in part, a natural tendency, as natural as to import a band or a speaker or clothes or mineral water. At every village dance the young fellow who can boast of an out-of-town girl has scored a social triumph. It is an expression of the principle of exogamy, which appears in all grades of society from savagery to royalty. The coeds are indeed often invited to the Prom, but there is an obvious absurdity in a girl's packing all her things in a trunk, leaving her sorority or boarding house, and moving over to a fraternity house, a few blocks away, while the escort whom she has dispossessed puts up with what lodgings he can find about town. Besides, as the young men tell me, they want "ornamental girls" for such occasions, and "who wants to spend a lot of money on a girl that he can see every day for nothing?"

Except in such cases as this, where

*For information on the Cosmopolitan Club movement see the reports of the two national conventions also an article by Louis Lochner, of Wisconsin, first president of the National Association, in THE INDEPENDENT, January 28, 1909.

PANORAMIC VIEW OF THE UNIVERSITY OF WISCONSIN.

Copyright, 1900, by W. J. Long & Co., New York.

the anti-democratic standards of the fashionable world infringe on university life, there does not seem to be much of any discrimination against the women of the university. And except for the undue devotion to social activities on the part of a small proportion of the students of both sexes there does not seem to be any "coeducational problem" in the University of Wisconsin. As I have shown in the article on Stanford University, participation in society does not bring down the grades of the women so much as it does of the men, but as usual the blame for the failures of both is thrown on the women. I have also shown that the drift of the men away from the literary courses is as great in men's colleges as it is in coeducational colleges, so it is not fair to blame the women for this. I therefore can see no excuse for President Van Hise's action in promoting a movement for segregation in the University of Wisconsin.* The movement started, curiously enough, in the desire of Professor Ely to get more women into the classes in political economy, which he feared was coming to be regarded as a purely masculine subject. It was taken up for the opposite reason by some of the literary professors from the monastic colleges of the East and had made considerable headway before it was disclosed. As soon, however, as it became known to the public, it was interpreted as an attack upon the basic principle of coeducation. The chivalry of the West was aroused, and the storm of indignation from the alumni and press all over the State put a stop to it. The committee of the faculty, which the president had appointed to investigate the question, never made a report. The friends of the women had no difficulty in disproving the charges brought against them whenever these became audible. It was shown that the quality of the women students as a whole was not deteriorating; that more of them entered with advanced standing; that they did more advanced work; that they did not lower the standard of scholarship, but supplied their full quota to Phi Beta Kappa. It had been alleged that

many of the women were coming to the university for a term or two in order to get into society, returning home as soon as they had made a sorority and acquired a useful circle of acquaintances. That is undeniably true of some, but it was shown that the women, as a whole, were nearly as persistent as the men and improving more rapidly in this respect than the men. During the period 1870-1892, 16 per cent. of the men and 12 per cent. of the women who registered as Freshmen remained to graduate. During the period 1893-1908, 19 per cent. of the men and 18.4 per cent. of the women completed the course. The health of the women had not been injured by their college work, for of men who were graduated from 1869 to 1906, 5.8 per cent. have died and of the women only 4.7 per cent. The proportion of women in the College of Science and Letters has increased from 29 per cent. in 1887 to 45.9 per cent. in 1908, but why that, or the fact that some elective courses are practically monopolized by the women or the men, should alarm any one I do not see. A college class is not a ballroom or a dinner table that it should be so nicely balanced. On the contrary, the chief benefit of free coeducation is that it tends to minimize the sex consciousness which the usages of fashionable society are contrived to exaggerate.

Compulsory segregation, however kindly intended, works to the disadvantage of the weaker party, so it is fortunate that there are to be no "Jane Crow" classes in the University of Wisconsin, at least not for the present. The agitation of such a question is always injurious, but the outcome was beneficial. As the attack upon Professor Ely established liberty as one of the fundamental principles of the University of Wisconsin, so the regents completed the triad by adding equality and fraternity, when they, in June, 1908, passed the following resolution:

"Men and women shall be equally entitled to membership in all classes of the university, and there shall be no discrimination on account of sex in granting scholarships and fellowships in any of the colleges or departments of the university."

President Van Hise, in the article referred to, advocated two methods of segregation; one, that which I have been

*See his argument in favor of segregation in *Educational Review*, December, 1907. Also "The Movement against Co education," by Warden A. Curtis in *THE INDEPENDENT*, August 6, 1908.

discussing, providing separate sections for the two sexes in such subjects as political economy, ethics and languages; the other providing vocational courses which would draw women away from the liberal arts department as the engineering courses have drawn off the men. This latter seems to me to deserve the name of "natural segregation" rather than the former, to which President Van Hise applies it. Not from such an unworthy motive, but because women have as much a right to training for the duties which nature or custom have assigned to them as the men have, the movement for higher education in housekeeping should be encouraged. That cooking and sewing are woman's work is popularly supposed to be one of the questions which were decided for all time "by the primordial protoplasm." We are becoming skeptical nowadays of such protoplasmic predestination, and fortunately we are not obliged to settle the destiny of woman for more than a generation ahead. But for the present it is clear that the main business of most women is in household administration and industries, and that this is an unorganized, unskilled and

uneconomical trade needing an educational uplift as much as dairying and journalism. Wisconsin has been somewhat slower than rival institutions in developing along this line, but next year the department of home economics is to be reorganized and established in Lathrop Hall, the handsome woman's building, which has just been completed.

I should be unjust to President Van Hise if I left the impression that his blunder in encouraging the segregation movement—it certainly was impolitic if nothing else—was characteristic of his administration in general. On the contrary, he has been very successful in developing the university during the five years he has been in office and his plans for the future are aspiring and statesmanlike. Trained in a science, geology, which is unique in combining the historical and the utilitarian, he has kept in mind both the cultural and the practical needs of the institution. He has made it his special object to secure a recognition of the duty of the State to support research work in pure science and at the same time he has brought the advantages of the university to classes of people who, because of distance or lack of preparation, have been hitherto thought to be beyond its reach. What he said of his ideal in his inaugural address may be taken with more confidence than is customarily given to such utterances, because he is a man of few words and never talks for the fun of it:

"The final and supreme test of the height to which a university attains is its output of creative men, not in science alone, but in arts, in literature, in politics and in religion.

For my part, I look forward with absolute confidence to the liberal support by the State of a school whose chief function is to add to the sum of human achievement. I am not willing to admit that a State university under a democracy shall be of lower grade than a State university under a monarchy."

When Professor Van Hise was elected president there was strong opposition to him, both political and personal, but he has overcome this feeling, and solely by the growth of confi-

The new building, 1910.

dence in his character and purposes, for he has none of the arts of popular politicians. In the West the ability to "jolly up" a crowd of any kind and to talk fluently and pleasingly on any occasion without saying anything worth while, is so common that it has come to be expected of every public man, and the lack of this in President Van Hise was, absurd as it may seem, the chief cause of his unpopularity at the beginning of his administration. One of the students told me of a Freshman who came to his dining club with the remark: "What do you think, fellows; I walked up hill with Prexy this morning."

"Well, did he say anything?"

"W'y, yes. Of course he was a little embarrassed at first, but I soon put him at his ease, and, do you know, I found him a very interesting fellow."

I tell this story because it seems to me to be characteristic of the change in attitude of the students as a whole; they thought him a little embarrassed at first, but have since discovered his real worth. In some respects President Van Hise reminds me of President Eliot, in his reserve, in his scientific turn of mind, in his knack of saying the right thing at the wrong time, and in his ability to pick good men for his faculty, the rarest and most valuable of presidential qualifications.

President Van Hise is planning now for a university of ten thousand students, which he expects within the present generation. The first of the buildings of the greater university has been erected, a heating plant of 10,000 student power. I had marked my snap-shot of this as "the ugliest building on the campus" to form a companion piece to the old dairy building which struck my fancy, but I have since read in the president's report that "its exterior is so pleasing that there has been very favorable comment on its architecture," so I am obliged in due deference to authority to withdraw my caption and sacrifice the antithesis. The architectural rearrangement of the campus is a difficult problem,

THE PRETTIEST BUILDING ON THE CAMPUS
The old dairy building.

in my opinion not yet satisfactorily worked out. The present buildings are without harmony or system, but it would not do to call the campus a *tabula rasa*, as was done in California, for many of them are too good to be discarded. One of the largest of them, the armory and gymnasium, is as far as possible from the drill ground and athletic field. Chadbourne Hall, which is the only dormitory for women, and Lathrop Hall, which contains their lunch and club rooms and gymnasium, are on the opposite side of the campus from the proposed location of the other dormitories for women.

The most interesting feature of the president's architectural plans is his effort to solve the housing problem by the erection of two groups of dormitories, or, rather, student homes, along the lake shore, one for men and the other for women. The former are to accommodate 125 to 175 students each and the latter 60 to 100. Each hall is to be complete in itself, with dining, reading and common rooms, built around three sides of a garden with southern exposure, on the opposite side from the lake. Each hall will contain some students from all departments and classes, a larger and more representative group than the fraternities, yet not too large for mutual acquaintance. Such a student home would

be so attractive as to reduce the fraternity to its proper sphere, whatever that may be, and intra-hall athletics would largely replace the inter-collegiate, with a greater chance of preserving the true amateur spirit. It is greatly to be hoped in the interests of the college world that this plan may be carried out, as there is no other institution experimenting on just these lines. The difficulty is to find the money to build them fast enough, for if two were completed every year the students at the end of ten years would be more insufficiently accommodated than they are now unless the rate of increase decidedly slackens.

In beauty of situation Wisconsin's only rivals are California and Cornell. Its campus circles along Lake Mendota for a mile, while from its hills there is a magnificent view of the city and the farms, woods and lakes round about it. But the campus owes its attractiveness to nature, not to art. Little has been done for its embellishment since the days when the mound-builders, who were apparently disciples of the Nietzschean Zarathustra, placed the eagle and the serpent on its hilltops. In fact, the fine arts have not yet taken root in the University of Wisconsin, which in this respect is behind the other State universities, and that is saying a good deal. There is, however, a school of music, and, following the example of Michigan, some of its courses are given credit on a par with other studies of the university. Architecture is not taught, at least not the kind that is known as "long-haired architecture"; the other kind, the structural, receives some attention in the College of Engineering, where valuable investigations on concrete construction have been carried on. Wisconsin has nothing to correspond with Yale's collection of paintings, Cornell's collection of casts, California's Greek theater or Harvard's museums of natural history.

There has been no regular department of mining engineering, but that work is to be taken up in earnest next year, and it is characteristic of Wisconsin that a correspondence course in mining is established simultaneously with the four years' resident collegiate course. The newly organized College of Medicine has likewise this double aspect. It has as yet

few students, but the group of men who have been called together to form its faculty are already hard at work on the two extremes of their science, research and popular hygiene. A visit to the attics of the chemical, engineering and science buildings, where the medical department finds temporary lodgings, is like plunging into the atmosphere of Johns Hopkins; there is the same zeal for investigation and the same disregard for environment. On the other hand, when one hears the discussion of plans for tuberculosis exhibits thruout the State, and the testing of water and serums, it seems more like the University of Minnesota. There will be two years of medical work given at Madison based on two years of college. The students will have to complete their medical course elsewhere, for the University of Wisconsin has no hospital facilities.

The College of Law presents no original, or at least no spectacular, features. It seems to have pursued the even tenor of its way, confining itself to the training of practitioners, without taking part in the research, extension and constructive work in legislation which has been carried on so vigorously in other departments of the university. I presume it would be impracticable to send the law seniors around the State to act as justices of the peace for part of their laboratory work, as the teachers in training are sent into the public schools, but there ought to be some way of making the lawyer useful to the community, and, what is more important, of making him feel that he is.

The system of teaching fellowships just referred to is one of the new methods devised by the department of education for solving the problem of preparing teachers for secondary schools. Wisconsin is not yet ready for the step taken by California of requiring a year of graduate study of all teachers in the high schools, but the university is doing what it can to make it easy for the teachers to acquire this advanced work. A teaching fellow is to be assigned to each of the important high schools of the State, receiving from the university \$225 and from the school \$100. He will teach under the supervision of university officers and return to the university during

the summer session for the completion of his graduate work.

To describe all the educational activities of the agricultural college would require an article as long as this. I am not sure that I can even count them straight. There is the "long course" of four years, with graduate work leading to Ph.D. in addition; the "middle course" of two years; the "short course" of two fourteen-week terms; winter and summer dairy courses of twelve weeks; a farmers' course of ten days, accompanied by a course in home-making for their wives. This, I believe, is all at Madison. For the State outside there are farmers' institutes, co-operative work at county high schools, butter and cheese scoring exhibitions, young people's corn-growing contests, milk production tests, tuberculosis demonstrations, spraying demonstrations, and inspection service of many kinds.

With such work as this the public is

somewhat acquainted. More interest, therefore, attaches to the new fields into which university extension is being extended. Having done so much for the farmer, or, rather, very much more than I have indicated, the University of Wisconsin is turning its attention to the mechanic. The Morrill Act, which started all this in the United States, placed "instruction in the mechanic arts" on an equality with that in agriculture, but the development of the two branches has been astonishingly unequal. There have been comparatively few agricultural students taking the full course in residence, while the propaganda work among the farmers outside has been energetic and ingenious. On the other hand, all the work in mechanics and engineering has been done by regular students in four-year courses, and nobody thought of doing anything for the men in the shops. That this field should have been so long neglected is remarkable, because there

CORRESPONDENCE-STUDY CLASS OF THE UNIVERSITY OF WISCONSIN AT THE BUCKY SHOPS MILWAUKEE

The two men at the lower right hand corner are teachers from the University who meet the class every two weeks.

was practically in demand coming from the farmers for vocational training, while in other industrial lines there has been the greatest eagerness for it. This demand has been partly met by the private correspondence schools, but not very satisfactorily, because, after the student had enrolled and paid his fee in advance, the sooner he stopped sending in papers the better for the school. It is estimated that \$10,000 monthly is sent out of Wisconsin to Eastern correspondence schools. The university, in taking up this vocational training, does not confine itself to correspondence methods. When the work was begun last year classes, aggregating 263 students, were opened in eight large manufacturing concerns in Milwaukee, more than one-tenth of their entire force. The companies provided and equipped classrooms and gave the men the time to meet the instructor, who came to them every two weeks. Artisans' courses have been established in the university similar to the shorter courses in agriculture, and the bright students in the correspondence work may be given scholarships sufficient to pay their expenses at the university for a brief period of study in the shops and laboratories there. Last year a bakers' institute, analogous to the farmers' institutes, was held in Milwaukee, in which experts in wheat and flour, food chemists, bacteriologists and practical bakers took part. As a token of their appreciation of such work, the Merchants' and Manufacturers' Association of Milwaukee had a bill introduced into the recent Legislature which appropriates \$50,000 for extension work for next year and \$75,000 for the year following. This was passed, and in addition \$30,000 a year was made for agricultural extension and \$25,000 a year for farmers' institutes.

When the extension work is fully organized there will be a representative of the university, with three or more assistants, in each of the eleven districts into which the State is to be divided. He will have his headquarters at one of the public libraries, and will organize lecture courses, look after the correspondence students, provide officials and the public with information and expert assistance, advise young people as to the choice of

a profession, and furnish books, clippings and outlines for lyceum debates.

What will come of this rural free delivery system of education no one can tell yet. It looks like a big idea. At any rate, it is a logical development of the Wisconsin principles of breaking down the barriers which separate the life within the college from the life without, and of getting all the public agencies to working together. The normal schools and the denominational colleges, instead of fighting the university, are affiliated with it, sending many of their students to the State university for the professional courses after they have finished the "junior college" work. In 1904, when George Foster Peabody wanted to give the people of Georgia a demonstration of the advantage of one strong institution in a State instead of half a dozen scattered and weak ones, he chose Wisconsin as his object lesson, and chartered a train to take to Madison the Governor, members of the Legislature, trustees of the university, judges of the Supreme Court and other prominent men.

The university receives its reward for making itself useful by popular appreciation and generous support. For the two years beginning today the recent Legislature has provided about \$2,500,000. Of this, between \$700,000 and \$800,000 comes from the regular two-sevenths of a mill tax. For books there is a special appropriation of \$50,000 a year, and for building \$200,000 a year.

But however liberal may be the support given by a State to its university, it needs to be supplemented by private beneficence, for there are many things of the highest importance which do not appeal to the people but may be discerned by some person of unusual foresight and knowledge of conditions. Such a person was the late William Freeman Vilas, who bequeathed his entire fortune, amounting to \$20,000,000 or more, to the University of Wisconsin. Colonel Vilas was for seventeen years a professor of law and for eleven years a regent of the university. That he had a thorough understanding of its capabilities and deficiencies is shown by his will. One has been published by the university in a memorial pamphlet, and is of great interest.

both from a legal and an educational standpoint.

After the death of his wife and daughter the estate passes into the hands of trustees, who are to allow half the income to accumulate until the capital reaches \$20,000,000, and then a quarter of the income until it reaches \$30,000,000. The surplus is to be spent for the university according to provisions which are very definite and yet ingeniously elastic. In brief, the university will ultimately have, first, a large and handsome theater, suitable for assemblies and musical and dramatic entertainments. Then there will be sixty undergraduate scholarships of \$400 a year and sixty fellowships of \$600 or more. Part of these fellowships are for travel and foreign study; part of them are for art and music.

At least one-fifth of these scholarships and fellowships are to be given to students of negro blood if worthy and

qualified candidates present themselves. This is an amusing instance of our conflicting State legislation; what Kentucky prohibits Wisconsin compels, that is, co-education of the races. Musical festivals are to be held and prizes offered for the encouragement of musical talent and appreciation. Finally, there are to be ten or more research professorships established. The incumbent is to receive a salary between \$5,000 and \$10,000, and may retire after fifteen years on a pension. The professor shall never be required to give instruction for more than three hours a week, and he shall be provided with whatever he needs for his investigations; assistants, clerks, mechanics, collectors, books, specimens, apparatus, traveling expenses, etc. In short, if a college professor were to describe his ideal of Heaven, it would be very much like a Vilas professorship, but, like Heaven, it is in the indefinite future, and it will be hard to attain.

The George Washington University

BY RICHARD D. HARLAN, D.D., LL.D.

[Dr. Harlan is a son of Judge John Marshall Harlan, of the United States Supreme Court, and, as the special representative of the George Washington University, gives an authoritative reply to the criticisms of the Carnegie Foundation.—EDITOR.]

IN its issue of June 17, on "The Carnegie Foundation and The George Washington University," THE INDEPENDENT's comments upon the work and mission of the university were so friendly that I have asked this opportunity to say certain things about its work and mission which ought now to be said.

In the rehearing, which in due time will be asked at the hands of the trustees of the Carnegie Foundation, and which, in justice to the cause of higher education at the national capital, will surely be granted when the full facts are presented, the university authorities are confident that—in regard to our requirements for admission and graduation—it will become as clear as noonday that the executive committee's recent action was taken upon an entire misapprehension of the situation; and that, as soon as the

university complies with the rule of the Foundation with reference to the minimum of productive endowment, The George Washington University will be restored to the list of "accepted institutions." For—with due regard to varying local conditions—the purpose of Mr. Carnegie's princely endowment of a "Foundation for the Advancement of Teaching" was, surely, to encourage and never to cripple, institutions that were earnestly striving to serve their own localities, and, with equal sincerity, were endeavoring to advance the standards of higher education. It is an excellent thing to have a giant's strength, but it is supremely important for such an educational Titan to use that strength gently and with discrimination.

We covet the most rigid scrutiny—far more complete than the courteous repre-

...and the Foundation was able to give during his recent two days' visit. And we are extremely confident that a more minute inspection of our actual, every day work, and a fuller consideration of the special functions performed by The George Washington University to its local constituency will show that the progress made by this university during the past five years—in the direction of that "advancement" of educational standards which the Carnegie Foundation is seeking gradually to bring about in all parts of this unevenly developed land of ours—*has had few parallels in the history of higher education in America.*

The action of the Foundation's executive committee was, in part, avowedly based upon what appeared to the committee as a disproportionately large number of "special students" in the university—"more than one-third of the total enrollment." To us on the ground the committee seemed to have made the serious mistake of applying, rather mechanically, the yard-stick of a general rule to peculiar local conditions, which most educators would say ought to be judged in their own light, and measured by a far more flexible standard.

There are all kinds of "special students." One type ought, as far as possible, to be weeded out of American university and college life. Recall the delights of campus and dormitory, the athletics, dramatics, glee clubs and all the charming *camaraderie* of student life at such institutions as Harvard, Yale, Princeton, Columbia, Brown, Williams, Amherst and Cornell. Factors to compel all the trouble-makers and loafers out of the college—those who have shirked their work all thru preparatory school, and who, if the bars were let down, would dearly love to "take a few special courses at college" and enjoy three or more years of idleness and loafing in such an environment as indicated above. In the case of institutions of that type, any sane critic of American university and college life would readily admit that the able men who, from their Washington offices at 200 Fifth Avenue, are endeavoring faithfully to conduct a nationwide examination and further of our universities and colleges, are doing what they shall help the given university or college,

and never hamper its local usefulness), would only be rendering a wholesome service to such institutions if, when necessary, the Carnegie Foundation warned them that the number of "specials" was approaching or had passed the danger point. And in deciding just when that point was reached it would be safe, and entirely just, for the Foundation to base such a warning upon the condensed statistics of matriculants, and to apply with an almost mechanical uniformity the thumb rule as to what would be "a disproportionate number of special students," without detailed inquiry into the exact character of such special students or of the relations of the institution in question to its own constituency.

But to any one with a full knowledge of educational conditions at the national capital, and particularly the type of "special students" attending The George Washington University, it seems essentially unscientific, and unjust to the community as well as the university, to insist that we must apply, far more rigidly than we are now doing, the yard-stick of "15 points" of high school work to those who apply for admission as "special students" and who wish to take simply a few subjects, with no intention of working for a degree.

There is very little in the student life of The George Washington University to attract the undesirable type of "special students." We have neither dormitories nor campus, and no athletic field of our own. Our student activities in athletics, dramatics and in social matters are inevitably reduced to the minimum, altho the authorities are glad to do all they can to encourage the student in a proper acquaintance of these features of college life. But the physical limitations being what they are at present, precious few applicants for admission as "special students" come to us from that class of young men, whose main desire is to enjoy "college life" for a year or two, with a little study thrown in, simply for the purpose of saving one's face, or avoiding a step parent's criticism.

The population of Washington is *sinuensis*. Our special students are of two types:

(1) There are many bright young men in the Government service, who have

come from parts of the country where good high schools were few and far between, and who were therefore unable to get "15 points" of high school work to their credit. More often than not, these young men are from twenty-five to thirty years of age. But they are ambitious for something better than a life position as a Government clerk, and they wish to take a few special courses at the university, in order to add to their intellectual equipment and enable them, later on, to earn a better livelihood. While we have abolished our "night schools," we always expect to maintain classes from 4.30 to 6.30 p. m., in order to make it possible for Government clerks to get a better education than their earlier opportunities afforded them.

Such young men do not come to the university to have a "good time"; they come "for business," and they are an unusually serious lot of fellows. Instead of being condemned by our friends at 576 Fifth avenue for admitting even a large number of such "special students" we ought to be commended. Our primary mission is a local one. We are set here in this community to serve the people of Washington, to meet their peculiar educational needs, and it would be a criminal neglect of our public duty if we applied the "15 points" rule too rigidly to such a deserving and intellectual class of young men. Here is a typical case: We have just enrolled, as a "special student" for next autumn in the College of the Political Sciences, a Government clerk over forty years of age, who, in order to fit himself for better service in his present position, will take certain courses in the political sciences. He could not dig out more than 8 "points" from his high school course of twenty-five years ago; but he is well qualified by reason of his age, his serious purpose and general experience, to pursue the course elected. We are doing him and the Government a service in letting him in. And yet he would go to make up the apparently fatal "*one-third of the total enrollment.*"

(2) There is in Washington a second type of "special student," whom it is surely the duty and privilege of this university to serve—a class of well-to-do people, with some leisure and study, who

are desirous of taking a few special courses, such as English literature, the languages, philosophy, economics, political science, diplomatic history, etc. Many of them may never have taken the regular high school course, but most of them have had a good deal of general culture and intellectual ability.

Bearing in mind always, that (because of its lack of campus, dormitories, etc.) this institution is in no danger of an influx of idlers who would enroll themselves merely for the purpose of having a "good time"—surely no reasonable person would hold that The George Washington University ought to close, or narrow, its doors to these two classes of "special students"—*provided, always, that the previous preparation of such a student for the particular subject he wishes to elect fits him to pursue that subject without demoralizing or retarding the regular students in that course.*

The words just italicised give the crux of the whole question, which seems to have been lost sight of by the Carnegie executive committee, in the undue emphasis it had laid upon the fact that "more than one-third" of our "total enrollment are special students."

To illustrate the matter concretely, let us say that the Carnegie examiner looked at the admission card of John Smith, showing the full "15 points" of high school work. "John Smith is all right," says the examiner. Next, he inspects the card of William Jones. To take an extreme case, for the sake of illustration, we shall say that Jones has only 6 "points" of high school work to his credit. "That's bad," says the examiner, and forthwith he adds Jones's name to what seems to him to be a dangerously long list of "specials." He has never seen Mr. Jones. He does not know that he is a serious-minded Government clerk, twenty-five or thirty years of age, whose six "points" of preparatory work were won in subjects which, when added to his serious purposes and good mental caliber, qualify him abundantly for admission as a "special student" in the particular subject he elects, with no harm to the university and much good to himself.

Those who have observed the type of earnest "special students" found in The

George Washington University, and who are all equally well acquainted with an entirely different type of "special," who, in spite of all rules, will so often slip into such institutions as the ones just named (because of attractions which this university does not possess), will subscribe to the statement, which is made here deliberately, that, taken as a class, the "special students" attending the George Washington University have nothing corresponding to them in other institutions.

In judging of our "special students," two points should be kept clearly in mind:

(1) This university admits no one as a candidate for a degree unless the applicant substantially meets the entrance requirements. How, then, could we "lower," by a single ell, "the value of the A. B. degree" in admitting even a large number of "special students" of the two types described above?

(2) Taking as an extreme case the applicant with only six "points," it should be remembered that his six "points" were not won haphazard, in any subjects; but, if admitted at all as a special student, it is because those "points" showed the necessary preliminary education fitting him to take up the special subject or subjects he may elect.

I have said enough to convince any scientific investigator of educational problems—and particularly of the educational needs of the capital—that it would be most unjust to this institution and to this peculiar community to apply too rigidly, and at long range, a *general* rule against "specials" that was made to fit entirely different conditions.

If that recent Commission is to help and not to complicate the same old higher and practical education at the capital, there must be a far more discriminating estimate of local needs, and of the plain duty resting upon The George Washington University to meet those needs, than has been made by the Commission Committee, in so far as its recent action was based upon our educational standards and policies.

And now will THE INDEPENDENT permit me to say some things about the real aims of this university? The Commission's sympathy with the general

idea of developing a strong university at the national capital, and its friendly attitude toward The George Washington University have let its editor into some misapprehension or exaggeration of those aims.

Unquestionably, the Federal capital—with its wonderful libraries, museums, laboratories and collections—offers extraordinary facilities for graduate work, and the day will surely come (in spite of all difficulties and obstacles, and in the face of all narrow and provincial objections) when *some* institution here will co-ordinate and effectively utilize those facilities for advanced teaching. And yet, as far as The George Washington University is concerned, the evolution of our graduate work will come as a natural outgrowth of the work we are doing in our various undergraduate departments; and even now we are doing graduate work in certain lines that will compare favorably with the work done in many an institution boasting of immense endowments.

But we are not bitten, in the least, by any ambition to become the great national university of which so much has been said. Our fundamental mission, as well as our supreme desire, is to serve our own community, by furnishing to the young people of Washington (1) the best possible general education, by means of our college of arts and sciences; (2) a thoroly practical and liberal education, as a means of livelihood, in the fields represented by our college of engineering and the mechanic arts, our departments of law, medicine, dentistry, our college of pharmacy and veterinary science, and our teachers' college, which has already been officially recognized as being of great value to the public schools of the District.

As we are the only non-sectarian university in the District, and are so centrally located, we are in a position to render yeoman service in the fields of higher and practical education to this intelligent and growing population. A city of this size surely needs a strong university to meet the local educational demands; besides which, the capital of this great nation ought to have such a university. Now, if a university can be developed here, which on its own lines

would be to the District of Columbia what certain large universities are to their respective cities, such an institution would, in time, become of no little national importance, because of its very location.

The editor of THE INDEPENDENT has said that the financial problems confronting The George Washington University are due to "its effort to expand into a metropolitan university of the standing of Columbia or Chicago." The explanation is offered in an entirely friendly spirit, for he goes on to say that altho such plans are "ambitious" they are "not impracticable," and that he hopes "they will be carried out." But he is entirely mistaken as to the present program of The George Washington University. What the next twenty-five years may bring to the university bearing the immortal name of the father of his country we modestly leave to the future.

But what we have done is to lift our standards of entrance and graduation, and to shift the entire university from the "night school" to the "all day" basis, simply in order that we might the better serve our own community. Here are some eloquent figures showing how this university, under President Needham's wise administration, has contributed toward the "advancement of teaching" in the city of Washington. Eight years ago we had 1,300 students; today, there are more than 1,500—a very respectable increase. But when the figures are analyzed, the real advance is nothing short of remarkable. Eight years ago, out of the 1,300 students, *only 71 were giving all their time to their college and university work!* Today, we have more than 500 giving their full time, and with a splendid body of half-time students, who, with a few exceptions, are here "for business." Eight years ago we had only 11 teachers giving their entire time to the institution; today there are 44.

The growth in number of full-time

students during the last five years has shown, beyond a shadow of doubt, that there is a local demand for the development of a first-class university, capable of meeting all the educational needs of its permanent and temporary residents.

And yet, while our primary mission, as well as our supreme ambition, is to serve the citizens of Washington, there is, however, one special field of service to the whole nation which we do propose to enter, and that is the field represented by our new college of the political sciences, the enlargement of which is being financed separately from the university as a whole, by means of a special five years' sustentation fund of \$25,000 a year, which is now being raised for that college.

If public-spirited Americans, both men and women (who would appreciate the added prestige coming to their country if American consuls were more uniformly ideal representatives of our people), and the business interests of the country (which have a financial stake in the development of "A Consular Corps of Well-Disciplined Soldiers of Commerce") will now come forward and complete the sustentation fund for this new college of the political sciences, located at the national capital, we are confident that, in the efforts which President Taft and Secretary Knox are making to bring about a complete and permanent reform of the consular service, this new college will soon become a valuable ally of the Administration, and it will be all the more effective because such a consular training school, as well as the Government, is relieved of all the embarrassments that would inevitably arise, if, at this stage of our progress toward the civil service millennium, the Government itself were to attempt the financial support and active management of such a school.

THE GEORGE WASHINGTON UNIVERSITY,
WASHINGTON, D. C.

Samuel de Champlain

BY DR. EDWARD D. COLLINS

[The following is a brief account of the celebration of the Discovery of Lake Champlain. The celebration is managed by the States of New York and Vermont, who have made large appropriations for the purpose, as has also the National Government. Perhaps the most elaborate celebration will occur at Crown Point on July 5 and at Ticonderoga on July 6. President Taft will be in attendance and Senator Root will make one of the principal addresses. The author of the following article is the Professor-elect of Pedagogy in Middlebury College.—EDITOR.]

IT is to be hoped that one of the results of the tercentenary celebration of the discovery of Lake Champlain will be the discovery of the man whose name it bears. Readers and writers of English have paid comparatively little attention until recently to the career and works of a man who was in many respects the most remarkable of all the pioneers in the exploitation of the New World. Americans cannot excuse themselves on the ground that they have no interest in Canadian history; for Champlain was not only the founder of New France, he was also the first explorer in the true meaning of the word at the New England coast, and quite the first to publish a full and accurate report of his observations. He was, moreover, the first European to give an exact account of the life of the Indians of New England and New York. His writings contain passages of especial fascination to New Yorkers and Vermonters, being the narration of the first white man who viewed and described the shores and islands of the lake to which he gave his name and the adjacent mountains. Yet for 270 years his writings remained a sealed book for English readers, and not until still more recent years have his works been available in any general way to the American public. One cannot read many pages of the voyages without feeling himself irresistibly drawn toward this central figure who first opened the northern door of the beautiful Champlain Valley to white visitancy, that individual in whose career one mere student has enough to make a fair large enough to merit a great commemorative celebration. Yet this fact is not his chief claim to distinction. His fields of activity were so numerous, so rich in varied incident, wide travel, and

perilous adventure, his permanent contributions to the knowledge of aboriginal conditions were so many and so positive that he placed succeeding generations repeatedly under obligations to him. A brief survey of some of these activities and contributions will better enable one to appreciate the man who first broke into this corner of American wilderness with the arts of a civilized race.

This versatile personality was for almost one-third of a century the inspirer and the dominating spirit in French exploration and colonization in America. He was especially well prepared for his work. Temperament, education, and early associations contributed to this end. Samuel Champlain was born in 1567, in Brouage, a little seaport on the Bay of Biscay. His father was a captain in the royal navy, and this with other circumstances in the boy's early life gave him an acquaintance with military and commercial enterprises. He fought for the King in Brittany. He was for a few years quartermaster in the army and gained business experience in its departments. He mastered the elements of navigation. He gave attention to cartography. He visited the West Indies and for over two years studied at first hand the operation of Spanish methods of colonization. He made sketches and plans of the principal ports of the islands, thus early cultivating that habit of using his pencil to which we owe so much. He landed at Vera Cruz, went inland to the City of Mexico, on his return made his way to Panama, and there, more than three centuries ago, his fertile brain conceived the idea of a ship canal across the Isthmus, "by which," he says, "the voyage to the South Sea would be shortened by more than 1,500 leagues."

His voyages to the Atlantic Coast be-

TREATY BETWEEN PETER MINUIT AND THE INDIANS
NEGOTIATED IN 1624.

By this transaction Minuit came into possession of the whole of Manhattan Island for a consideration of \$24.

gan the great work of his career in 1603. Champlain was then thirty-five or thirty-six years old. An old acquaintance, Aymer de Chastes, Governor of Dieppe, under whom Champlain had served in the royal fleet off Brittany, came to court to seek a patent of Henry IV. "resolved," as Champlain says, "to proceed to New France in person and dedicate the rest of his days to the service of God and his king." The gray-haired veteran found in Champlain a man after his own heart, and the latter was nothing loth to leave the antechambers of the Louvre for the uncharted shores of the New World. He accompanied the expedition in the capacity of geographer to the king.

To the incident of this appointment as well as to Champlain's custom of making full notes and sketches do we owe the cultivation of his habit of preparing full reports of his experiences with the utmost care. His official appointment impressed upon him the responsibility for ac-

curacy and fullness, while it created a de-

demand for the products of his pen. In this voyage Champlain explored the Saguenay River some thirty or forty miles. He noted the extraordinary features of the stream and its shores, and altho not the first white man to view them he was the first to give an account of them. He went up the St. Lawrence River also as far as the Lachine Rapids in boats and a few miles further on foot along the shore. His characteristic thoroughness is shown in this expedition. Sixty years before him Cartier had traversed the same course. His brief and fragmentary narration had no marked influence in stimulating interest in exploring New France. Champlain explored both shores of the river, the bays, inlets, and tributary streams, described the character of the soil, the forests, the animal life, the vegetable products, and the Indians who exhibited

marked differences from those found by Cartier. The results of his exploration Champlain published in an elaborate report under the King's sanction, and this report became an authoritative and important work in the early stages of French colonization in America.

Champlain's next voyage brought him to the coast of Nova Scotia, whither he accompanied a colonizing expedition headed by De Monts and Poutrincourt. It happened that Champlain was the best engineer in the party and to him fell the lot of choosing the site and laying out plans of the grounds and buildings. His main purpose, however, was exploration, and from the settlement as a base he began to extend his knowledge of the region at the first opportunity. Thus began the first detailed observation of the New England Coast made by European. Champlain spent three summers in this work, and his winters in charting the region and making many local maps of bays, harbors and rivers. The first of these surveys he began in September, 1604. He examined the coast from the St. Croix to the Penobscot, gave then names to Mt. Desert Island and Isle Haute, and penetrated the Penobscot as far as the site of the city of Bangor.

In a subsequent voyage he explored the mouth of the Kennebec and Sagadahoc.

observing carefully the natives and their customs and noting comparisons with the habits of the Indians found further north. He saw one of their fortifications, a palisade fort, and stopped and made sketches of it. He spent two days at Old Orchard Beach. He conferred with the Indians at Cape Ann, gave them a piece of charcoal and got them to draw a rough outline of Massachusetts Bay. They showed him the location of several different tribes by arrangements of pebbles. He sailed into Boston Harbor,* followed the shore, and a few days later entered Plymouth Harbor, a decade and a half ahead of the Mayflower. Of Plymouth Harbor Champlain made a fairly accurate drawing. He described the Indians and their occupations and implements. He then rounded Cape Cod and proceeded as far as Nauset Harbor, at which point, provisions running short, he turned back to his little settlement.

It was Champlain's intention to complete this exploration of the New England Coast the following summer. This plan was interfered with by Poutrincourt, who wished to see for himself the points covered in the previous year's exploration. Thus delayed, Champlain proceeded as far as Chatham Harbor, where it became necessary to put in and repair his disabled barque. This done, he sailed along Vineyard Sound, which marks the southern terminus of his New England explorations.

Thus he completed three years and four months of pioneer work of the most thoro kind on the Atlantic Coast at a time when there was not an European settlement of any kind on the eastern shore of North America between his own little colony and Florida. Nor had there been any previous exploration of any significance. Gosnold and Pring had touched the coast, but left brief and indefinite notes. Weymouth anchored at Monhegan Island during Champlain's second summer. John Smith gave the English their fullest early description of

*The first voyage of Champlain to Boston Harbor was in 1605. He sailed from France, IV. 1605. Champlain's description of the same expedition is given in his *Journal*, 1605. Edward Taylor, *History of the State of New York*, in his edition of Champlain's *Journal*, 1605. Statter's *History of the State of New York*, in his edition of Champlain's *Journal*, 1605.

the New England Coast, but Champlain's painstaking and exact record antedated the romantic Englishman's by a decade, while in point of historical value it was far more important. It covered an ample and fairly accurate survey of the sinuous New England Coast line for a thousand miles; it gave minute and careful descriptions of the soil, forests and people. In respect to the latter, it portrayed their appearance, dress, habits of life, occupations, domestic relations, and civil institutions. This is the earliest accurate account of the New England Indians before their contact with white men, and it is the nearest approach to a critical study of them left by any early voyager.

The monopoly of the fur trade, under which De Mont's little colony was to be established, was rescinded in 1607, and Champlain sailed for France, after a brief exploration of the Basin of Mines. His activities hereafter were to lie in the Valley of the St. Lawrence, in which his initial exploration had been made five years before. A quarter of a century of hard work awaited him. His comrade

in command, Pont Gravé, stopped at the active center of the Canadian fur trade, Tadoussac, but Champlain left him there and on June 30, 1608, held his course up the river till he reached the rugged cliffs where three days later he laid the foundations of Quebec. Champlain's pencil has given us a rude picture of the little group of wooden buildings which his workmen erected. Here with twenty-eight men he elected to spend the winter while Pont Gravé returned to France. Twenty of his twenty-eight men were dead before spring, and half the rest were suffering from disease. It had been a winter of tragic misery. But no sooner had the returning sails gladdened the eyes of the little band of watchers on the cliffs than Champlain resumed his plans for exploration. An ordinary man would have had enough of it. But Champlain's mind was not at rest, and within a fortnight of Pont Gravé's return he had set out an expedition into the country of the Iroquois. The incidents of this expedition are to be commemorated next July.

RUINS OF FORT TICONDEROGA
Captured by Ethan Allen, May 10, 1778.

Champlain's immediate purpose was twofold, to enlarge his personal knowledge of the country, and to gain political advantage thru alliance with the Algonquins of the Ottawa and the Hurons of the lake beyond. The fur trade was the great asset of the wilderness. Upon it depended the success of the settlement at Quebec and the fate of New France. The fur trade, in turn, depended upon the co-operation of the Indians of the regions named. Thru their wildernesses came the fur-laden canoes; thither lay the ever-luring path to China. These tribes could not be depended upon to help the French unless the French could be depended upon to help the Indians. This was the give and take of Indian politics. Champlain was the soul of honor even in dealing with savages. Their relations meant nothing less than an offensive and defensive alliance. This alliance became a principle of French policy. Following this principle Champlain deliberately incurred the enmity of the most powerful native tribes in America, the tribes of the Iroquois, because they were the enemy of his allies.

The advance toward the lake, the conduct of his allies, the encampments, the deliberations, the methods of travel and difficulties en route, and the incantations of the Pilotois or soothsayers are all described in Champlain's account of the expedition. When the lake was reached and progress became more dangerous the plan of advance was altered and the company moved only by night and rather slowly up the lake along the western shore. It was anticipated that the war party, for it was nothing less, would pass thru Lake George and on the Hudson River, from which it might strike a swift blow on some outlying Mohawk town. Champlain's narrative is as follows:

"As we were all coming to the lake, on the west side I saw, as I was observing the country, some very high mountains on the east side, with some of the highest peaks. I imagined at the sight of some places very inhabited. They told me that they were the Hurons and Algonquins, and that in these places there were beautiful valleys and some of the best of the country. As I was going to the mountains, I saw a great many white tracks and saw the lake and some mountains, which were perhaps, as it seemed to me, about three leagues from me. I saw on the south side of the lake, high mountains, but they had no snow at all. The savages told me that it was there that we were to go to find their enemies, and that these mountains were thickly peopled. They also said it was necessary to pass a rapid, which I saw afterward, and from there to enter another lake, three or four leagues long; and that when we had reached the end of that it would be necessary to follow a trail for four leagues, and to pass over to a river which empties on the coast of the Almouchiquois."

The enemy, however, saved them the trouble of making so long a journey.

About ten o'clock on the night of the 20th of July, near Ticonderoga, an Iroquois flotilla was sighted, and instantly the silence of the night was pierced by the war screams of the two parties. The Iroquois made for the shore, landed, and threw together a barricade, for which they felled trees. Champlain mentions their use of stone axes. He and his party remained on the lake, within arrow range of the shore, lashing the canoes together with poles to prevent their separation in case of attack. By mutual assent the battle was deferred till daybreak, when the canoes were allowed to land and the allies drew up on the shore. The three Frenchmen in the party had managed to remain concealed in the canoes, and now Champlain's two companions made their way into the woods unnoticed by the enemy. As the Iroquois came forward from their barricade in good order and formed in line "strong and robust to look at," headed by three chiefs, and numbering in all about two hundred of the fiercest fighters on the continent, the ranks of the allies opened and there stepped toward the front, amid howling redskins, a single figure calculated to strike the Iroquois with amazement—a gentleman of France, clad in doublet and hose, armed with a breastplate and thigh pieces of steel, a plumed casque on his head, his sword hanging by his side, and an arquebuse in his hand. Thus, in the days of Shakespeare, when Milton was a year-old babe, eleven years before the landing of the Pilgrims, on the shore of a lake in the heart of the American wilderness did these splendid types of savagery and civilization confront each other.

Mark Twain has given a very entertaining picture of the juxtaposition of two stages of society thirteen centuries removed; but the Connecticut Yankee in

King Arthur's Court, bagging with his revolver the finest specimens of chivalry as they came charging down the list, enjoyed no more dramatic moment than did the gentleman of France when he raised his arquebuse at Ticonderoga and sent two hundred of the boldest warriors in aboriginal America running to the woods. Champlain wrote as follows:

"After we had gained the victory, they amused themselves by taking a great quantity of Indian corn and meal from their enemies, and also their arms, which they had left in order to run better. . . . This place, where this charge was made, is in latitude 43 degrees and some minutes, and I named the lake Lake Champlain."

The victors made a hasty return down the lake, while the vanquished who escaped sought their familiar paths to spread among the five nations the news of this strange encounter and to sow the seeds of implacable hatred of the stranger and his kin.

This expedition, while not comparable to Champlain's leisurely and critical examination of the New England Coast, gave him an opportunity to make a hasty survey of the lake for nearly its entire length and furnished the French a valid claim to the region. This claim was the basis of French seignioral rights which stretched from Chambly to Crown Point, along the eastern side of the lake, one of which, at least, passed from French to English hands with "rights of high, middle, and low justice" as bravely as any feudal manor, on payment of £12 lawful money "for the mutation fine." Champlain's arquebuse, however, nullified his discovery, for the enmity of the Iroquois was sufficient to prevent the easy establishment of those claims. The English pushed northward into the valley, threw out scouting parties right and left, and met the French chain of forts begun by de Tracy in the Richelieu Valley. Thus the ancient feud was passed on from the savage to the civilized races, the French and the English taking up the struggle of their prototypes, Algonquins and Iroquois.

A few more of Champlain's efforts deserve passing notice. In 1615 he brought to New France four Recollet friars whose mission work laid the foundations

of the unparalleled record made by the Jesuits in North America. His zeal as an explorer carried him far up the Ottawa, westward to Lake Nipissing, thence to Lake Huron, to Lake Ontario, and to Central New York, where he once more attacked his old-time enemies, the Iroquois. He joined the fall hunting party of the Indians in 1615 and has given the earliest and one of the best descriptions of Indian life in his picture of it. In 1632 he prepared a final edition of his works; in 1633 he returned from France to Canada with a commission as governor; and two years later, on Christmas Day, he died in a little chamber of the fort at Quebec, stricken with paralysis.

Champlain's career challenges comparison with that of every other man of whatever nationality engaged like him in constructive pioneering. He was a patriot without being a pirate, a builder but not a buccaneer. Neither was he an exile, a refugee, nor a recluse. He was a full-blooded man, a man of grand dreams, but also a man of unrivaled execution, a man of vast conceptions, but also of unsurpassed versatility, undaunted courage, unwearied patience, and withal a man of tact, integrity, sweet temper, and Christian character. He undertook a great work for France, but his success consists of what he did for America. He established a standard in American cartography. He showed that the seventeenth century could produce a sympathetic, critical and observant student of Indian life. He was the most scientific explorer of America in his day. As a colonizer he met in Canada the problems which John Smith faced in Virginia, but he confronted these problems for years instead of months. As an historian he surpasses Smith in accuracy and fulness of important detail, Bradford in comprehensiveness of vision, and Winthrop in the breadth of his tolerance and the wide range of his interests. None in the history of New France outranked him as a leader of men. None surpassed him save in single qualities. As soldier, sailor, engineer, colonizer, leader, geographer, cartographer, ethnographer, historian, religionist and patriot he stands alone in his times in unrivaled versatility.

Literature

Rockefeller Painted by Himself*

ADJECTIVES are insufficient for describing the utter simplicity of this self-revelation. Naïve, artless, ingenuous, childlike and bland—all fail. Is it possible that this most muck-raked and cartooned of men is really the saintly souk, the tender philanthropist, the scrupulous business man, the model of fidelity, the composite of the Vicar of Wakefield, Jean Valjean's bishop and Benjamin Franklin portrayed in these pages? Has a cruel world mistaken Sir Galahad for Shylock? Has the rabble been stoning King Arthur and the Government persecuting St. Francis?

It seems incredible that Mr. Rockefeller can have adopted so consummate a pose unless he be a past master in the art which conceals art. Could the m u d d y Mississippi pretend to be a babbling brook, Captain Kidd pass for Father Damien, or Cortes transform himself into Dr. Primrose?

From the time he turned an honest penny by raising turkeys to the escape of Standard Oil from a fine of \$20,000,000, the path of this good man has been straight and shining as the noon gleam on the waters. Harried, slandered, pelted with mud, he has marched straight on, head erect, guided by the stars, patient, long suffering, forgiving. "There can be no permanent success without fair dealing that leads to widespread confidence in the man himself," he testifies. Who can doubt Mr. Rockefeller's success? What is the inference? Trust

JOHN D. ROCKEFELLER

were hard in 1893 for shipbuilding companies, and "many of their employees were facing a hard winter." "We took this into account" and "made up our minds to build all the ships that could be built and give employment to the idle men." Incidentally the ships were got at bargain counter prices; but, of course, that was a secondary matter. "Standard Oil did not ruthlessly go after the trade of competitors and attempt to ruin it by cutting prices." How could it, seeing that "the underlying essential element of success in business affairs is to follow the established laws of high-class dealing"? As to rebates, which, prior to 1880, when they were made unlawful, Standard Oil, it must in frankness be said, did accept; yet, even then, "it received no advantages for which it did not give full compensation." Plainly it has not taken rebates since 1880, for when has a court collected a fine from it or compelled a day's imprisonment of one of its officers? "I have had at least my full share of adverse criticism; but I can truly say that it has not embittered me, nor

left me with any harsh feeling against a living soul." Could Count Tolstoi lay hand on heart and say as much?

Of genius there is no sign in the work unless it be in the plans for organizing philanthropy thru a benevolent Trust. Platitudes about being virtuous that you may be prosperous, admiring anecdotes about colleagues, disinfected fragments of Standard Oil history—these reveal no ability above sea level; but the canons of "the difficult art of giving" are distinctly

*Illustration by permission of Mr. John D. Rockefeller. New York: Doubleday, Page & Co., 1910.

higher than the datum line. Yet a sense of wonder remains. What qualities enabled this rich man who is a poor author (to quote one of Mr. Carnegie's *bons mots*) to rise from poverty to multimillionairehood? He was thrifty, cautious, persistent and impeccably honest (so he says); but so are many who remain poor. He was not drunken, lustful nor pleasure-loving. Neither are millions of proletarians. Can it be that he was immeasurably pre-eminent only in that art of bargaining, that peddler faculty, which he learned so early and practises so easily as hardly to know himself that he is dean of the guild?

More Novels Yet

THE length of the "closed seasons" in the publishing world has been reduced to a minimum; the summer brings but a partial diminution in the activities of our publishers, while preparations are going

from production. It appears that in this branch of business, as in most others, there can be, beyond the supplying of the normally growing demand already existent, a constant stimulation of new demands, or, at least, a continual attempt to create them, at any time of the year, with a reasonable expectation of success. The potential "best seller" is just as likely, nowadays, to be offered to the reading public in mid-July as at the beginning of the revivifying, energizing autumn. It is, however, generally a "best seller" of the lighter type, for the significance of the words "summer reading" is plainly traceable in the fiction that is now being put before us, the fiction which will reach the summer resorts about the time when their other amusements begin to grow stale and unprofitable from prolonged familiarity.

It is safe to say that among the books here reviewed there is no probable "best seller." Most of them will help to pass a long afternoon pleasantly; the others

ILLUSTRATION FROM CABOT'S "MAN WITHOUT A SHADOW"

on for the autumn. Midwinter alone, the six weeks after New Year, continues its old tradition of momentary cessation

are to be added to that annual "rubbish fall" of fiction of which Mr. Howells spoke some years ago.

The automobile has had its sixty-miles-an-hour day in our fiction; we are now waiting for the dirigible balloon and the flying machine to suggest new *variations sur des thèmes connus*. Meanwhile we can amuse ourselves with wireless telegraphy. There is more than this to the plot of Mr. Edwin Balmer's story with the alliterative title of *Waylaid by Wireless*,¹ however—an ingenious idea that is so near to possibility that one wonders in apprehension if the hint will not be taken by the light-fingered brotherhood. Why should not an American hotel thief prey upon his countrymen, and especially his countrywomen, making the tour of the English cathedral towns? The idea is original with Mr. Balmer, we believe, and we hold also that in this notice of his book the secret of his plot must not be revealed further. This invention alone would have sufficed the author to produce a readable book; for good measure he adds the counter-complication of wireless at sea.

Heroes and heroines who have lost their memory there have been many in novels, no doubt because, here, too, fiction can keep closely to facts. One of the cleverest of recent additions to the long line is Oliver Cabot's *Man without a Shadow*.² Its plot has been well invented and worked out, and the incidents contrived in a perfectly natural way. The story lays no claim to literary quality, it makes no literary pretensions, but it holds the attention easily and agreeably until the end.

Mrs. Penhagron's *The Shrew Girl* is compounded of much familiar material, the Quartier Latin being its most important ingredient. It has plenty of plot, young, healthful sentiment, and is told in the form of letters, a rather unnecessary form, one would think, were it not handled with considerable cleverness.

One dealer of Mr. F. Phillips Oppenheim were woe when he laid the scene of the first half of his new story *The Governors*,³ in the United States. He is an ingenious weaver of plots, a felicitous

inventor of adventure, but he fails to convince us of the reality of the atmosphere of American frenzied finance in these pages. This sort of thing has been done so often that with us the novelty has worn off; we have ceased to be interested, wherefore our novelists have abandoned the *genre* for awhile. Otherwise there is here all that one can wish for in the matter of conspiracy and its foiling, danger, a courageous heroine, and, of course, love. In America and among Americans Mr. Oppenheim is too palpably an unfamiliar stranger.

Another book whose atmosphere fails to carry conviction is Mr. George Barr McCutcheon's *The Alternative*.⁴ In this tale by a native writer we are taken into the very stronghold of New York's exclusiveness, but it reads as if the author had drawn upon his imagination rather than upon first-hand knowledge of the life he describes—an objection, by the way, which need carry no weight with the enormous majority of us who never enter New York's clubs or drawing-rooms; who are, indeed, more familiar with its fiction than with its facts, and probably prefer them. The book is a summer trifle, its happenings ingeniously made to take place, for the sake of the contrast, in midwinter. The thought of a blizzard is welcome in August.

To the ever-lengthening list of her novels Mrs. Amelia E. Barr adds this summer *The Hands of Compulsion*,⁵ a tale of the Isle of Arran and of Scotch character, of which it will suffice to say that this author's admirers will have no reason to feel disappointed at her latest product.

The struggle of the girl, young and handsome, who has to go out into the world—the American world—to earn her living, is still awaiting the novelist who will do justice to a complex and puzzling problem. Of Elizabeth Dejeans, who attempts to handle it in *The Winning Chance*,⁶ it must be said that she has failed. As a study of social conditions her story has no value whatever; as a story it is conventional.

¹Waylaid by Wireless, by Edwin Balmer. Boston: Houghton, Mifflin & Co., 1910. 320 pp. \$1.50.
²Man without a Shadow, by Oliver Cabot. New York: D. Appleton & Co., 1910. 300 pp. \$1.50.
³The Governors, by F. Phillips Oppenheim. New York: The John A. Walter Co., 1910. 320 pp. \$1.50.
⁴The Alternative, by George Barr McCutcheon. Philadelphia: J. D. Appleton & Co., 1910. 320 pp. \$1.50.

⁵The Hands of Compulsion, by Amelia E. Barr. Philadelphia: J. D. Appleton & Co., 1910. 320 pp. \$1.50.
⁶The Winning Chance, by Elizabeth Dejeans. Philadelphia: J. D. Appleton & Co., 1910. 320 pp. \$1.50.

Mr. Charles Ford has based his *Outcast Manufacturers** upon an utterly erroneous theory of art. Realism is not literalness; photography is not painting. His painstaking care to report the broken, unformed sentences by which the uneducated convey their ideas fails of its purpose. There is such a thing as selection and perspective.

A volume of short stories, *Beyond the Skyline*,⁹ by Robert Aitken, wanders into many strange corners of the earth. The author has borrowed Kipling's trick of "knowingness," of nonchalant allusion, and the assumption of familiarity with

civilization is corroborated by the English geographer who writes this book. He regards the sanitary problem so far solved that "a healthy city life in the tropics would be easily attainable in a new country settled wholly by white people and under a medical despotism." He is further inclined to believe that farm life is also possible to them without a peasant class of another race, but he thinks that the Mediterranean races would be more likely to thrive as agriculturists than Anglo-Saxons. In this as in other points Mr. Cornish has done more than merely report conditions and

DIGGING THE DITCH.

From "The Panama Canal and Its Makers." Little, Brown & Co.

strange people and their ways in his readers and in himself. The stories are much better than the ordinary run, but the impression they make vanishes with the closing of the book.

The Panama Canal and Its Makers. By Vaughan Cornish. Boston: Little, Brown & Co. \$1.50.

What THE INDEPENDENT has said about the opening up of the tropics to white

progress on the Canal Zone, but he has not neglected the descriptive part for the expression of his own opinions. On the contrary, he has put a remarkably large amount of information in the small compass of this volume, and has treated the vexed questions of engineering and administration in an impartial and broad-minded way. There is no better book for the general reader who wants to know just what is being done in Panama. As the author says:

"The Pyramids are another wonder of the world, which, in common with many thousands in all ages, I have thought it worth going to

⁹BEYOND THE SKYLINE. By Robert Aitken. New York: B. W. Huebsch. 12mo. \$1.50.

*OUTCAST MANUFACTURERS. By Charles Ford. New York: B. W. Dodge & Co. 12mo. \$1.50.

see—but to go to Culebra is as if one were privileged to watch the building of the Pyramids. You have a whole lot of things on purpose to see these things, and, *mirabile dictu*, how the Americans!

Literary Notes

....Next to an ignorant doctor, an incompetent helmsman is the most dangerous man to be met with in our every day lives. Accidents and fatalities would be greatly lessened if every person who put his hand to the tiller first familiarized himself with the essentials of navigation. Amateurs and even experts will find *The Small Yacht*, by Edwin A. Boardman (Little, Brown & Co., \$2), of both interest and value. The book contains about two hundred plates, diagrams and plans.

....The lectures on practical theology of Principal Oswald Dykes, for many years the leader of Presbyterian theological education in England, are published under the title of *The Christian Minister and His Duties* (New York: Imported by Charles Scribner's Sons). There are many treatises on homiletics, and it is a difficult subject on which to say anything fresh and important, but the counsels of Principal Dykes will be found well worth attention, especially on the subject of the conduct of Christian worship.

....A ponderous volume, suitable for the sedate company of State and departmental reports, has been issued under the direction of a Committee of Governors, containing the full proceedings of the Conference of Governors at the White House in May of last year upon the Conservation of the Natural Resources. It is doubtful whether this belated issue will be of much service except to decorate the shelves of the Governors whose observations it reveals. Fortunately, the principal addresses many of them highly valuable, were published at the time in pamphlet form and widely circulated.

....Dr. Edwin Munsell Bliss's *The Missionary Enterprise* is well described in its subtitle, "A Concise History of Its Objects, Methods and Extension." Works of this sort need continually to be rewritten, since in no department of human activity are methods changing more rapidly than in the work of foreign missionaries, and in none do statements of fact become more rapidly out of date. The student will find in this volume a statesmanlike presentation of the objects for which the most progressive missionaries are working and the methods by which they are seeking to accomplish them (Fleming H. Revell Co.)

....Dr. William Seaman Bainbridge has published his lectures delivered at Chautauqua under the title, *Dr. Seaman Bainbridge's Lectures on the Principles of Life and Hygiene*. The book is a safe one for the average well-informed person, and it is a good one for the average person who is interested in medicine and hygiene. It begins with the baby, in the chapter called "Infancy," and follows the man from the "Infancy" to "Twilight," ending

in "Night," with many sensible and scientific suggestions as to wise avoidance of danger and proper physiological ethics. It is free from any trace of the morbid or the pessimistic—in a word it is a healthful book on health. (Stokes, \$1.35.)

Pebbles

It is all right in books for a girl to have a lover who worships her from afar, but outside of books she wants him to come a little nearer. —*Atchison Globe*.

(Advance proofs of that thoro, masterful article, written for the *Dependent* by that authority, Dr. Slashem.)

I feel that I have done a good day's work. I have spent eight hours in Ithaca. I have studied and investigated Cornell University from top to bottom; besides I have put five hours on my account of the University of Tombstone.

The first thing that struck me in Ithaca was when I was about to alight from the train. The brakeman swung his lantern in my face. I soon came to realize that Cornell is vitally, radically different from other universities. Cornell is in Ithaca. On the contrary, Princeton, and I believe I may safely say Michigan, are not. It was with this idea firmly in mind that I set to work.

Climbing the magnificent hill, the campus touchingly recalled to me the dear old correspondence college I attended when a young youth. On the campus I came in direct contact with the students of Cornell. I overheard the conversation of two. As I watched them, one surveyed me critically. I judged that he was a civil engineer. And how serious minded are these young men of Cornell University. For one of the two I watched asked the other, "Have you the makings?" I did not catch the answer but I know the reply was, "Of course I have in me the makings of a great man!"

After this glimpse into the ambition of the student, I repaired to the Hall of Humanities. There the esthetic young man learns to get leaves of absence every three weeks, and other fine arts.

Soon afterward I met a Mr. Hoy. He wears a bland smile and a very smart waistcoat; and I really consider his nose one of the very finest features on the campus. Among other things Mr. Hoy informed me that Cornell had the best registrar in the country. I asked Mr. Hoy about the University Tank. He said something about two members of '89 and '94 sharing that distinction.

Now I may sum up my observations by stating, without the slightest fear of contradiction, that Cornell is Cornell. This statement I make knowing that it will be considered sensational. It is the most original thing that has ever been printed in the *Dependent*. This is enough for one article. I have written it in the empty lot behind the Agricultural buildings, in order to get as much college atmosphere as possible. —*The Cornell Tribune*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

WEEKLY MAGAZINE. FOUNDED IN 1848

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, 75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send a receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume be returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should reserve a copy.

Advertising rates will be furnished on application.

What Makes a Liberal Education

LET us come down to common sense. What is a liberal education? It cannot be defined. The term is extensible and reducible. Its meaning depends on the community and the age. Going through college does not give it; a learned man may lack it.

The subject is suggested by President Eliot's surprising proposal to put on a shelf five feet long some twenty-five books whose careful and repeated reading will give a man a liberal education. We have read the list, so far as published, and it has its merits and defects, as all such numerous lists have. They show the personal equation. In each one-half the books could remain unread and yet a man have a liberal education.

For a moderately liberal education a man must be able fairly to apprehend the current history of the world. He should first read a good daily paper. He can skip all that does not make history, the accidents, the crimes, the society events, the games and races, the actresses and divorces; but he cannot omit the major events, the process and progress of legislation, the movements of democ-

racy, the conflicts of privilege, the discoveries in science, the inventions in the arts, the diplomacy of nations, and the general advance of civilization. For these are the things that a man of liberal education should be able intelligently to understand. These things are of importance to humanity, and to have them foreign from one's education leaves it utterly illiberal. Therefore the first thing necessary is not a book for the shelf, but a broad intelligent journal for the table.

Then for books. It is impossible to gain a fairly liberal education without the basis for an understanding of these current facts of history; and this requires the reading of some books. What are the important books?

Largely text-books or compends. For example, one should have read and fairly mastered reasonably full treatises containing the latest conclusions in the chief sciences, such as chemistry, physics, geology, biology and astronomy, so that he may be able to gage the value of what he reads in the journals and magazines. He will keep in touch with new discoveries and inventions. He will be a man of his age, for liberal education is the education of this and not of some past age. Equally he will read as good text-books as he can find in sociology, political economy and governments. This will require reading of the history of the principal nations, or, at least, of a general history of the world. He must have read enough on the history of religion to distinguish their differences and their worth.

Now comes the question of the value of pure literature in a liberal education. There is no doubt of its importance to put the polish on an education which is truly liberal, that is, an education that will fit a man intelligently to perform the duties of a citizen able to guide public sentiment and direct the policies of his community or his nation. But pure literature is not of the framework, the bone and muscle of a liberal education, but of that beauty which is skin deep. It is delightful to read Chaucer or Dante, but many a man of a liberal education has read neither. Spenser's "Faery Queen" is nothing less than luscious, but not one highly educated man in a hundred has ever read it. Bacon's essays

could have very much read who has the leisure for it, but he can also do without it. The long lists of famous names of ancient and modern times attract us and give us additional "culture" if we have time for them, but the bulk of them are not essential to what is called a liberal education. You cannot call that a liberal education that is not familiar with the Bible, because our English thought is so much based upon it; and we suppose we ought to add the *Iliad*, the *Odyssey* and the *Aeneid* for a similar but less weighty reason, but it is not necessary in these days to add the works of any other classical author, unless it be Plato's "Apology" and "Crito"; not even the Odes of Horace.

And when it comes to the older English poetry and prose, Shakespeare—well one needs to have read his plays twice or three times, to be fairly intelligent, altho President Eliot's list does not include Shakespeare—perhaps it is assumed that the Bible and Shakespeare are already in possession before the five-foot book shelf was planned for. For other poetry one can get all he really needs for a fairly liberal education within the covers of two or three volumes which give us golden treasures of accepted verse. And as for prose, the "Spectator" and the whole series of essays and orations, even Lamb and Macaulay and Burke, need to be dusted once a year by the careful housewife. We are too busy with the essentials of the liberal education of today to trouble ourselves overmuch with them.

Is this iconoclastic? Yes, it is, and we do not like it near as much as we believe in it. Find us, if you can, the rare man, who has not to work his ten or twelve hours a day to keep up his end in the world's service, and who has time to do what every man with a liberal education longs to do, if he adds to it the taste and the passion for what is beautiful and fascinating in the concinnities of chosen words, and what is noble and inspiring in the enthusiasms of brave thoughts; and he will feed his mind and soul with the fairest purpled fruits and sweetest fragrant confections of the ages; and blessed is he if he does not become a sybarite of culture, and is yet able to use a liberal education for the only purpose for which the world will ever value it.

The New Fourth of July

At a first glance it appears that July 4 is precisely what it was when that state-hest of Puritans, John Adams, expressed a wish that the Declaration of Independence should be celebrated with guns, speech-making and all conceivable expressions of joy to the end of time. This sort of celebration has become an American instinct; and it probably can never be eradicated, if we would. The philosophy of this sort of celebration is that we had rebelled against parental tyranny. We celebrated a boy's success. For years we shook our fist at the mother country and in a truly boyish way defied her. Our institutions were brought into shape mainly in this spirit of revolt. We would be as much unlike Britain as possible; no nobility, no kings, no primogeniture; everything was to become full of youth and novelty.

Hamilton tried to stay the tide, and failed abruptly. The Federal party, with old England as a model, was so completely routed that it disappeared in 1804. If Hamilton had not been shot he would have passed far more completely out of our national record. The party with the Fourth of July triumphed. It was right and best, and it was also a good thing that the Fourth got into our blood. There was no reason why we should try to repeat old Anglo-Saxon social ideas here in America. When they came from Zealand and Jutland to Britain, they were sharply modified; the change to America required a greater modification.

So it was that boys made the New World, and the boyish spirit is the Westward Ho spirit. Boys like noise; let them make all they please. As long as the Fourth of July makes a supreme roar from the Atlantic to the Pacific, so long is the United States still young enough to hold its own; still young enough to think new thoughts, and with vitality to assert itself. Legislation cannot stop this ebullition. Theodore Roosevelt is the incarnated Fourth of July. Noisy, ebullient, de-light-ed; his highest notion of a school includes a target and a gun. He wishes every American boy ready to turn in and whip every possible and imaginary invader.

It is only the fringes of the Fourth

that make the trouble, the uneasy preliminaries and the irrational after-noise. It is the exaggeration and not the boyishness of the day that has become intolerable. Let us have just one full day of racket, and bluster, and brag; just one twenty-four hours of letting loose from every thought of business and care, but let it be limited to that spirit and that period. It is asking too much of our nerves to endure a riot that has emptied itself of every thought of pride and patriotism. Let it be a John Adams Day, when even President and Puritan cut every string of red tape, roll on the turf and kick up like boyhood.

This does not mean to give the day up to boys and children, but to be boys ourselves, all together. Let the day retain the universality of its beginning, when old and young were equally interested. We are dropping out too much the fact that it is the people's day; the American civic exploitation, as Thanksgiving is our American religious celebration. We shall still need one great School Day to complete the trio; but not at the expense of the other two—perhaps Arbor Day will serve for the schools—we think not.

But all this while remember that the American people has grown in sentiment as well as in numbers, has outgrown its planting, and must keep up with its evolution. We have become more than a free nation; we have passed into the international group of nations. Last year Springfield, Mass., invited the various nations that aggregate our population, each to express itself separately, as well as jointly, in the celebration of the Fourth. Twelve peoples responded. They came in huge floats up the main street: the Swedes in a Viking ship; kilted Highlanders blowed bagpipes; the Irish came with their bards, and there were two thousand Greeks arrayed in classic robes, to recall Lycurgus, Socrates and Plato. The Italians were glorious with Galileo and none the less with Marconi. The Chinese barge displayed wonderful tapestries, and merchants from Armenia gorgeous embroideries. There were black men as well as white men; but every one placed the American flag dominant and sang our national songs.

We like this conception and expansion

of the Fourth, and recommend it to the American people everywhere. It celebrates not only our youth, but our progress. It makes happy citizens of our adopted sons and daughters; and it helps to fuse into a fine brotherhood the diverse elements that make up our people. Better than all, it will be a positive Fourth of July; creating a national character, in which we shall find the finer elements of the nations which have contributed to our national life. Race ideals will learn to adjust themselves to each other, and race antagonism pass out of sight. It is a good while since the Fourth of July began to be regularly celebrated in England, and Germany, and France, and even in Rio Janeiro and at the Cape of Good Hope; in fact, everywhere about the globe. Let us recognize its internationalism at home.

Dismissal of a Trust Suit

ATTORNEY-GENERAL WICKERSHAM'S dismissal of the suit against the New York, New Haven & Hartford Railroad Company for violation of the Anti-Trust law should not be regarded as indicating a reactionary tendency on the part of the new Administration. The truth is that this suit ought not to have been undertaken. It was not warranted by the facts and could not have been prosecuted successfully. We venture to say that Mr. Wickersham had these reasons in mind, altho in his explanatory statement he points to the bill enacted in Massachusetts for the promotion of the merger which the Government attacked, and to the decision of the Massachusetts Supreme Court which restrains the defendant company from holding trolley lines in that State.

If consolidation of the New Haven with the Boston & Maine was a violation of the Sherman act when the suit was brought, it is still a violation of that act, even if accomplished by means of the new holding company which Massachusetts has created by law, altho the consolidation is now to be made under conditions providing certain safeguards for public interests. And if the acquisition and use of city and suburban trolley systems by the powerful steam railroad

company was then sufficient warrant for the suit, it continues to be so, for the only trolley properties affected by the Massachusetts decision are those in that State which the New Haven Company had bought. It owned then, and still owns, a greater mileage of trolleys in Connecticut and Rhode Island, including lines which parallel its main tracks for considerable distances. Its possession and use of these trolley systems are not affected by the decision of the Massachusetts court. Referring to the Government's complaint that this possession and use of trolleys constituted an unlawful restraint of commerce, Mr. Wickersham says he is "convinced that whatever may have been the merit of the claim when the suit was begun, there is not now any such elimination of competition by reason of such ownership of trolley lines as would justify a further prosecution of the action." But the Massachusetts decision does not affect elimination of competition in Connecticut and Rhode Island.

So far as we can learn—and we are familiar with the history of some of these trolley lines and of the service on them—the acquisition of trolleys by the New Haven Company has been beneficial, rather than harmful, to public interests, having been followed by improvement of service, no increase of the cost of transportation, nor any suppression of competition. We have never been able to see any warrant for the suit in the trolley holdings, whether these were in Massachusetts or elsewhere.

Nor was there any in the attempted acquisition of control of the Boston & Maine, for that company's railroad system does not parallel or compete with the system of the New Haven Company. One lies in northern, the other in southern, New England. We think it was held by competent persons familiar with the situation that combination would probably improve service on the Boston & Maine. We had respect for the opinions of some who feared that the great power of the combined corporation would be used to the disadvantage of the public in either or both States. For there was impending no new suppression of competition or transportation. It may be true that the Government's suit was not

by the Government in the New Haven Company's acquisition of the steamboats plying between New York and Boston and intermediate ports, but that acquisition was not made one of the grounds of the suit. It is now asserted in dispatches from New Haven that the railroad company's officers had been assured by Mr. Roosevelt that its connection with the steamboat lines would not be attacked.

As we have said, if there really was a violation of the Sherman act in the attempted—or, possibly, the completed—acquisition of the Boston & Maine, and in the owning of trolley systems, it was not cured by the Massachusetts decision or by the Massachusetts Holding Company act. We observe that District-Attorney French, who brought the suit at the instance of the Department of Justice, said three days before it was dismissed:

"The passage of the Holding Company bill does not improve matters in the slightest degree regarding the Government suit. There still remains the offense against the provisions of the Sherman act. It is within the province of the Government to obtain a restraining order or injunction against the action of the Holding Company bill."

The Government did not take this course, evidently because it realized that it had no case. It remains to be said that the merger is to be made under wise restrictions. The holding company may acquire the Boston & Maine stock, and may sell it to the New Haven Company, but only with the consent of the Massachusetts Legislature, and only with such consent may it thereafter be sold by the New Haven Company. Moreover, Massachusetts may, by act of the Legislature, upon one year's notice, buy for itself the holding company's stock. It is the purpose of the new law to promote the projected consolidation, but under conditions which will preserve for the State supervisory control. This holding company differs widely from the one organized under a general law of New Jersey to hold the stock of two great parallel and competing railroads in the Northwest, as the conditions which the Government attacked in the Northern Securities suit differed from those which were made to serve as a basis for this case and which the Government has dismissed.

Bishop McFaul's Outbreak

OFFICIALLY, the clergy of the American Catholic Church are the foes of the American system of public schools from the kindergarten to the university, and equally of the great Eastern universities and colleges; but unofficially the laity endorse and support them. Wherever possible the parish priest is required to provide a parochial school; to have one is the condition of being a permanent rector. It is charged as an offense against this age that it would take from the Catholic Church its duty to teach the youth and would pass it over to the civil state and subject it to a secular power. Therefore parents are urged and even commanded to place their offspring thru the whole period of childhood in parochial or other Catholic schools, under risk of a merely secular education which becomes irreligious and impious. Accordingly parents are forbidden to send their children to a public school except where there is no Catholic school in which they can be taught, and then only by the permission of the bishop. Under such rules it becomes necessary for the Church press to magnify the dangers, and there is great temptation for bishops and editors to vilify the public schools and all our leading colleges and universities as "godless" and therefore immoral.

One of the most persistent and pernicious offenders in this way is Bishop McFaul, of Trenton, N. J. His last attack made in an address to the graduating class of St. Francis Xavier's College, in this city, is attracting much attention and not a little indignation. He declared that "Yale, Harvard and Princeton are undermining the faith and injuring the morality of their students":

"If people knew the rascalities, the immoralities, and the disrespect for female virtue rife within their walls, they would be horrified. If parents send their boys to institutions the professors of which teach that there is no such thing as an absolute distinction between right and wrong, they can have little regard for them.

"I have known sad things among the people who are filled with the fanatic and lunatic desire to get into society. I have known a girl, the daughter of good Irish parents, who refused to have her child baptized because she thought it would injure her social ambitions. It is the same social ambition which drives men to send their sons to Yale, Harvard, and Princeton."

After this address the degree of Doctor of Laws was conferred on Bishop McFaul.

Parents know the severity with which they are attacked by prelates like Bishop McFaul for sending their sons and daughters to non-Catholic schools, particularly the higher schools. The reason always attributed is that parents want to get social recognition. The idea that Catholic schools are inferior and that wise parents prefer Harvard to Villanova for sound educational reasons, they will not admit. Yet at the Milwaukee Convention of Catholic Education two papers were read which stunned the assembly by indubitable statistical proof of the incompetence of Catholic colleges; and especially was it understood by the meeting that Jesuit colleges were meant above all others. These papers were written by men who had for years been examining the A. B.'s and other alumni of Catholic colleges, and had found in them a sad poverty of either scholarship or mentality. We have seen as yet no answer to these two papers.

And as to morals. In every large course of young men there is likely to be some drunkenness and looseness of life. But we declare that at the three institutions attacked by Bishop McFaul the moral sentiment of the students and the average of decency are high and not low, quite as high as in any community educated in religious schools. We wonder if the bishop has ever listened to experienced priests commenting on the number of infidels and drunkards that issue from Catholic colleges. Let him count the drunken and immoral students at Yale, Princeton and Harvard; and then at any three of the largest Catholic colleges he may select, and if in proportion to number the former three are worse than the latter it will surprise more than one priest whose experience has made him familiar with this province of life.

Mind, we do not mean that Holy Cross, Allegany and Notre Dame are hotbeds of infidelity and vice, very far from it; neither are Yale, Princeton and Harvard. We simply mean that they cannot be set up by pulling down the universities attacked by the bishop. We are well aware that good morals and good religion are taught and practised in them. But it is Bishop McFaul who has shame

fully and shamelessly libeled these three universities by name, and done it slanderously as a part of that bulldozing and terrorism which are applied to parents, and which have had a partial, but far from complete, success.

Let us add that not Bishop McFaul alone, but a number of other gullible writers who ought to know better, seem to have found their spluttering ammunition in a series of three ridiculous articles by a writer in *The Cosmopolitan Magazine*. He claims to have gone in and out of the doors of a dozen universities, heard lectures, been special student, interviewed professors, and has gathered a hodge-podge of sensationalism in a most unintelligent way. He hears the merest commonplaces, such as that moral standards change, that the belief in evolution is prevalent, that higher criticism is rampant, that polygamy has been a valid form of marriage, that combined housekeeping is approved in crowded cities, and he draws the conclusion that the colleges condemn the family system and the sanctity of marriage, that the Bible is rejected and the existence of God denied, and all possible radicalism is taught to impressible youth. This is the miserable *Bolce far niente* which such men as Bishop McFaul swallow. We observe that the Catholic newspaper edited by Mr. Desmond just laughs at him.

Literature and Journalism

THIS was the subject on which Lord Morley was asked to address the great Press Conference in London the other day, and his address will be the occasion for many editorial utterances, to which number we may add one.

There are all sorts of journalism, and all sorts of editorial writings, the most serious and intelligent, and the most ignorant and vapid; but Lord Morley was right in considering only the former as worth the discussing. He told a great truth when he said that "the foundation of style" for the journalist especially "is a full knowledge of matter." This is a very simple statement, and yet it is almost overlooked, that the foundation of style is not style at all, but the content of the writing, the thought and substance of its remaining sublimity of full

knowledge." In full knowledge there is no beating about, no obscurity of thought because no uncertainty of thought. "I believed; therefore have I spoken."

Lord Morley's second rule for journalists and other writers is equally commonplace and true, that "the simple, the direct, is what every one of us ought to aim at, and every one of us can, if we take proper trouble, attain to." To say what we have to say in the shortest, plainest, most compact way possible, is the essence of effectiveness; and journalism is a fine school to learn this literature in. We do not mean that a writer may not at times make a gay play of his writing in a holiday sort of wildwood gipsying, but the main business of literature, and particularly of journalism, is to teach and influence the reader. That is what makes it worth while; just as the Congress which does things is of more importance than the playhouse.

If we were to supplement or interpret Lord Morley's teaching, it would be to say that the aim and task of writing journalistic literature is to present to the reader well digested views and opinions on as many current and important subjects as possible, to support them with the best arguments possible, and to do it all in the sharpest, most incisive way possible. The writer's business is to convince and influence, and this does not require rhetorical flowers, but logical force. It is important to be so confident of one's opinion, based on ethical or social reasons, that one can speak with the positiveness and emphasis of conviction. In these days it is the weight of the bolt that tells, not the sputtering of fireworks. Just as the old florid oratory has gone so the stately and stilted formalities of literature have given place to a style which knows no furbelows and obeys the rules laid down by Lord Morley and so well practised by him.

How to Keep a Scrap-Book

ONE of our readers writes to inquire the best way to keep a scrap-book. It is a lucky accident that the letter was sent in no matter of to somebody else because this is one of the things that we think we know, and we know we think that most people do not at least we can give

far correspondent the three fundamental principles of scrap-bookkeeping and let him apply them to his own needs, then if the system does not work it is not our fault. As the professor of chemistry is accustomed to say to his class, "Gentlemen, the experiment has failed, but the principle remains the same."

The primary requisites of a useful system of scrap-keeping are, first, celerity; second, mobility; third, classification by subjects. The scrap-book in any form is practically ruled out of consideration by all three rules, for it requires some bother to paste clippings in a scrap-book even if ready gummed, and still more to take them out for rearrangement, and it separates the clippings from all matter in other forms bearing on the same subject. The data that one collects in the course of weeks or years for some article or lecture come in all forms, pamphlets, magazine articles, newspaper clippings, letters, notes and perhaps maps, diagrams and pictures. It is of the utmost importance that these be brought together. To keep them in different places because they happen to be in various shapes is like classifying a library by putting the octavos in one case and the duodecimos in another, or arranging them according to the color of their binding. With books, in fact, it does not so much matter, for few of us are blest with such a large number of them that we cannot find the one we want in the dark, but scraps and clippings are more numerous, more fugitive and more valuable than books. A book that is lost can usually be replaced for a dollar or so, but an item you cut from an unknown newspaper or a note you jotted down *à la* Pope on the back of an envelope may be worth much more to you and is irrecoverable. Formerly librarians in large libraries used to despise pamphlets, while clippings were altogether beneath their notice. Nowadays they no longer despise pamphlets, they merely hate them, and they are beginning to take notice of clippings. The extension department of the University of Wisconsin, which pays particular attention to supplying the lyceums of the State with material for their debates on current topics, sends out for this purpose chiefly bundles of newspaper clippings and magazine articles on both sides of a question. One of the

most valuable of the assets of a large daily is its "morgue," which, starting as a repository for obituary material collected in advance of the occasion for its use, has become an elaborate clipping bureau in constant requisition. In fact it may be said that the morgue contains the live matter and the library the dead.

One rarely knows in advance just what he is collecting along a certain line; it is a sort of instinct like that of a squirrel gathering nuts for winter. It may turn out a song and it may turn out a sermon. The mind and the "scrap-book" should develop together, expanding, ramifying and rearranging, until some day comes the occasion or the central thought, and the whole mass of material arrives at its conscious reason for existence. Mobilization and segregation must be continuous processes, and that is why we object to such a scattering of forces as is involved in the system used by many persons whom we otherwise respect, those who keep their notes in a card index, letters in letter files, clippings in scrap-books and pamphlets in boxes.

The best way of keeping together all the material on a given subject, "printed or written or partly printed and partly written," as the lawyers say, is to put it in manila envelopes and these in a vertical letter file. The envelopes should be large enough to hold typewriter paper unfolded, that is, about 9 by 11½ inches. Some will prefer the folders without sides, such as are generally used in filing letters, instead of envelopes, as being a little easier of access. If clippings alone are filed a long envelope, about 4 by 9½ inches, holding a column, is more convenient. The vertical filing cases may be obtained in sections and expanded as desired. Or you can make your own box to fit the envelopes and get some kind friend to pyrograph or carve it with your book-plate. The envelopes may be saved from the mails fast enough if you do not care to buy them.

The best system of classification and arrangement for most people is none at all. When you cut a paragraph from a paper or copy a quotation or note a reference or invent an epigram, run your hand along the top of the envelopes, reading their contents until you instinctively find the one where it belongs, drop it in and write the title or key-word of it on

the envelope. If it does not seem to be irresistibly attracted by any of the existing envelopes, do not hesitate to give it one of its own and it will no longer remain lonely. Hundreds of envelopes and thousands of scraps can be kept accessible at a moment's notice. The only points to be observed are to list every item, however small, on the envelope unless already covered by a title there, and to scratch it out when you remove it. A clipping on divorces in France would be safely lost in an envelope marked "Sociology, continued," but if it is in an envelope with "Divorces in France" written on it you can find it no matter what its companions may be. When you get hold, no matter how, of a good story, illustrating, say, partisanship in politics, do not put it into an envelope marked "Humorous III," but in one containing some other political material, however serious, and scribble "Party Politics (Anecdote)" on the outside; then when you are called upon suddenly for a toast, as you usually are, there are the story and its point side by side.

If you insist on having a system of classification, a framework for all future accumulations, get the abridged edition of the Dewey Decimal Classification, and install a set of ten or a hundred envelopes, with these numbers, which will probably be the same as those used in your public library. This will take the place of a card index. The alphabetical system of classification is the poorest of all. You never can remember whether the statistics of liquor licenses in Maine are under P. J. or S.

When you see an article in a magazine that you want to keep, tear it right out; that, is if the magazine belongs to you. The only exception to this rule is THE INDEPENDENT, which for obvious reasons should always be kept intact and bound every half year. But you cannot keep every magazine, and you would not remember the article you saved it for if you did, so put it in the envelope before you lay it down. When an editor who really deserves the name of enterprising appears on earth he will publish his magazine in such a form that by cutting a thread at the back it will fall apart into sections, each of a single article, marked with a Dewey number and ready to be filed with others on the same topic in a binding or box.

Of course, if you have nothing to do but keep a scrap-book, or if you have a private secretary or a large family of unusually careful and helpful children, you can work out your own system of classification and index and cross index *ad libitum*. But unless you have the stamina to keep up a diary do not undertake a card index.

We do not say that the old-fashioned scrap-book has not its uses. You will find it convenient, for example, to keep one, as handsomely bound as you please as a sort of family record, for such kindly references as it has pleased the press from time to time to bestow on you and yours. You may put into it the praise your book or your speech received, the biographical sketches of yourself, the banquets you have attended, and all such memorabilia, for the purpose of cheering your declining years and of handing it down to posterity, for you may be sure that your grandchildren will pore over it as frequently and lovingly as you do over your grandfather's letter book.

Protectionist Democrats

When the tariff bill is perfected and passed neither party will have the right to put the blame of it on the other. Both have joined in higher protection. Take the votes on iron ore, which ought to remain free, as the House bill put it, and as it would have remained if eighteen Democrats, mostly Southerners, had not joined with too many Republicans to form a majority fixing a duty of 25 cents a ton. So with lumber. The House bill reduced the duty from \$2 to \$1 a thousand, and so it would have remained in the Senate if twelve Democrats had not voted for the higher duty. If those twelve Democrats had followed their platform the vote would have stood 40 to 38 for the lower duty. There had been a previous amendment offered making lumber free, as it should be, and if the seventeen Democrats who voted against free lumber had obeyed their party pledges it would have been adopted by a vote of 42 to 39. It is just so all thru the schedules. In every case the liberal Republicans, who wish to follow their own platform and reduce the tariff, are defeated because the standpatters can count on enough recusant Democrats to

beat them on the vote. When the next election comes, there will be great confusion. It is time that we had a fresh alignment of parties, so that the voter may know what he is voting for.

Governor Hoke Smith's Farewell

Governor Hoke Smith's farewell message to the Georgia Legislature was worthy of him. During his campaign for Governor it was a chief charge against him that as a member of President Cleveland's Cabinet he had given some minor appointments to negroes which might have been held by white men and women. He countered successfully by urging an amendment to the State constitution which would shut out negro voters, and as Governor he carried it thru. But the people would not re-elect him. They chose as his successor a man whom he had removed from office. In his farewell message Governor Hoke Smith boasts of this accomplishment of the amendment, and says the new provision "will protect even the smallest community from those who, unable to control themselves, are utterly unfit to vote on the rights of others." But he is determined that negroes shall remain unfit to vote. for he says:

"The future of our State requires that there shall be no illiteracy among our white children. I do not mean any unkindness to the negro child by this discrimination, but I don't believe that instruction from books, except of a simple character, is of any benefit to a considerable portion of them. Education should fit for life with a view to the character and possibilities of the children. The difference between the races should be recognized by the county school commissioners, and they should not hesitate to do so on account of the maudlin criticisms that may come upon them from certain classes of would-be philanthropists of other sections who don't understand the true nature of the negro or the true relations of the races."

His plan, which he would enforce on the school commissioners, is that it is best that the negroes be illiterate; for the State constitution says that the illiterate shall not vote, and by keeping them illiterate they will be kept from voting. So long as such a policy is brutally supported, "philanthropists of other sections" cannot do too much to extend the privilege of education to those to whom the State denies it. But we hope better

things from better men in Georgia. Hoke Smith is no longer Governor.

An Agricultural High School

The town of Petersham, Mass., was the first in New England to establish an Agricultural High School. The land and the building were the donations of half a dozen leading citizens, including about ten acres of land and a school building of stone costing about twenty thousand dollars. The movement was fostered by recent legislation which encourages high schools in the smaller towns, remote from high school centers. Harvard has stimulated action of this sort by giving prominence to industrial education in agriculture trades and home art. There was no opposition on the part of school authorities, but a good deal of favorable co-operation. So far as we know this has been the history of nearly every movement of this sort. The president of the National Educational Association in 1905 spoke the conviction of the whole body apparently, when he said that it was "high time that all our rural schools turn their attention to scientific agriculture." The courses of study at the Petersham school make provision not only for horticulture, forestry and general agriculture, but for history, language and mathematics. The course includes: (1) The wild flowers, birds and animals, and their habits. (2) The rocks, including their chemical composition and how they are made over into soil. (3) The kinds of soil, the crops best suited to each, and best methods of cultivating. (4) How to raise the best hay crop, and the right sort of culture to be given all the common standard crops. (5) How to raise and care for small fruits and orchard fruits, and how to prepare them for market. (6) How to conduct a market garden business, including the working of glass houses. (7) Injurious insects and harmful fungi, and how to manage them. (8) The principles of forestry and landscape gardening—how to lay out a handsome home. (9) The care of domestic animals, poultry and bees. (10) How to manage a dairy, and the culinary department of home. (11) The use of common tools, such as saw and plane and chisel. (12) The practical

including engines for farm work. The working of the school is so entirely satisfactory that the experiment is likely to be repeated in adjacent towns. It means a new character for American pupils and a new sort of American home, when our school life and school work are devoted to making character and making homes.

In Alsace-Lorraine the civil officials insist—no doubt under orders—in registering the names of newly born children in German. Lately a young father, living near Colmar, gave as the name of his young son Jules Louis. The register, however, wished to record Julius Ludwig, but the father protested and appealed to the chief local authority. His answer insisted on the German form of the names. Dissatisfied and remembering that the second son of the Crown Prince, and therefore the grandson of the Emperor, was named *Louis*, he wrote asking for information to the royal authorities at Potsdam. The answer reads:

"We assure you that the second son of His Imperial and Royal Highness, the Crown Prince, is named Louis Ferdinand Victor Edward Adalbert Michael Hubert."

Should by any chance this L. F. V., etc., ascend the throne, he would bear a name Louis, which the officials of Alsace-Lorraine refuse to recognize.

Duty of teaching and danger of flirting remain just the same as they were before a Chinese "convert" murdered a young woman in this city. There remains the same duty to educate and help the Chinese stranger in our gates that there always was, and churches should do no less. But this girl was no missionary, and had no part in the regular normal missionary work of the churches. Making love is no missionary work, which should be conducted in churches or mission halls, and publicly, and with all due discretion. It does not follow that all Chinese are bad because some are hypocrites or murderers; neither is it to be supposed that all mission workers, even women, are like this poor, sentimental girl.

We would lay the sweetest of flowers on the grave of Sarah Orne Jewett, who died last Thursday of paralysis. She

was the author of the simplest, sweetest stories and descriptions of New England life based on her close study of "Deep-haven" life in her native town of South Berwick and York County, Me., and the neighboring Eastern coasts. Her character was as beautiful as her person was attractive. She was thrown from a carriage and seriously injured half a dozen years ago, and this had put an end to the succession of tales which we had learned to expect and desire from her.

It is the baby, the Queen's baby girl, Juliana, who is responsible for the surprising defeat of the Liberals in the Dutch elections. They say that the victory of reactionary forces is due to the recent outbreak of intense loyalty to the House of Orange following the birth of the princess. Previously there have been a dozen Socialists in the Lower Chamber, but at this general election not one has been returned, and only three are eligible for the second ballots. Thus a little child leads them.

A few days ago business took a man we know from New York traveling on a Southern railway. There was report of disturbance in the Jim Crow car, and in an instant every other man but one drew a pistol from his pocket, and that one opened his satchel and took one out. Our informant was the only man of the thirty who did not travel loaded. In this State probably not one man in the car would have had a pistol.

It is not a bad proposition embodied in an amendment to the Payne tariff bill proposed by Congressman Sisson, that a tax of two dollars be put on all deadly weapons, such as pistols, dirks, bowie-knives, sword-canes, stilettos and brass knuckles, which it is a violation of law to carry concealed. Such a tax might bring in over a million dollars, and would do some good in discouraging the carrying of such weapons.

Darwin will receive significant honor at the centennial celebration at Cambridge University in the official representation of two professors of the Catholic University of Louvain, one a geologist and the other a biologist, and both exponents of the Church.

Insurance

The New President and Other Officers of the John Hancock

ROLAND O. LAMB, sometime vice-president of the John Hancock Mutual Life Insurance Company, was last week elected president of the company to succeed the late Stephen H. Rhodes. Mr. Lamb was born in Beverly, Mass., on December 20, 1850. He was educated in the public schools of his native town. He began his business career as a bookkeeper in a manufacturing house where he remained five years. In January, 1872, he entered the service of the company of which he is now president as a bookkeeper. In March, 1899, he became chief clerk, and in May, 1894, he was made secretary. Just a year later he was elected second vice-president and a director of his company. His election as vice-president took place in February, 1899. To the steady and

exceedingly substantial growth of the John Hancock Company and the high position it now occupies among the legal reserve companies of the country Mr. Lamb has contributed much and his very recent election to the presidency is a deserved tribute to sterling worth and a continuous service of more than thirty-five years. Col. Arnold A. Rand has been elected first vice-president, Edwin B. Holmes as second vice-president and William O. Blaney, third vice-president. The continued success of the John Hancock seems to be assured. The last published statement of this great company shows gross admitted assets of \$56,855,239. The total amount of binding insurance carried by the company was \$485,-

072,482. Since its organization the John Hancock has paid \$74,390,148 to its policy-holders. The record of the company has always been to conserve the best interests of the present and prospective policy-holders and their beneficiaries. This is the one object which the officers of the corporation appear to have always in view.

✱

CHARLES E. HUGHES, Governor of New York, has appointed a commission

to inquire into the question of employers' liability and the causes and effects of want of employment in New York. The constituency of the committee is as follows: Henry R. Seager, president of the American Association for Labor Legislation and professor of political economy in Columbia University, New York; Otto M. Eidlitz, builder, New York; John Mitchell, American Federation of Labor, New York; George W. Smith,

ROLAND O. LAMB.

steel transportation and railway official, Buffalo; Philip Titus, passenger conductor, Kingston; Miss Crystal Eastman, author and investigator, New York. The other members of the commission, appointed by the Lieutenant-Governor and the Speaker, are Senators Wainwright, Platt and Bayne, and Assemblymen Lowe, Voss, Thorn, C. W. Phillips and Jackson. The members will serve without pay, and present a report in detail, if possible, to the next Legislature. In view of the recent very material progress made in both these directions abroad, the findings of the Hughes Commission must be of more than passing importance. Their recommendations ought to have much weight.

Crops and the Industries

ENCOURAGING reports about the crops come from prominent railroad men who have caused careful inquiry to be made. President W. C. Brown, of the New York Central, has been going thru the States of the Middle West, to see for himself what the conditions are, and at the same time has employed competent men to make similar investigations. He has been thru Nebraska, Missouri, Illinois, Indiana and Iowa, and is convinced that "there has not been in thirty years so good a promise of abundant crops of all kinds." The reports of his agents, which he has sent to his New York office, tend, on the whole, to confirm his opinion. With the beginning of the harvest, the condition of winter wheat shows improvement. Spring wheat maintains its very high condition, and there is promise of a great crop of corn.

It is understood that President Brown sought information concerning the crops in order that he might be guided in placing orders for railroad equipment. Other railroad officers have been giving large orders. The Harriman order for 135,000 tons of rails was allotted last week, and the week's contracts were for about 225,000 tons, for which more than \$6,000,000 will be paid. The price of pig iron is rising. Wages were increased by 10 per cent. last week by the Thomas Iron Company, the Lackawanna Steel Company and the Empire Steel and Iron Company. The only incident on the wrong side of the account in the steel industry is the impending strike at the Steel Corporation's tin plate mills. At the anthracite mines of the Reading company work on full time has been resumed, owing to the general improvement. Railroad earnings continue to show considerable increases over those of last year. The gain in net earnings is now especially noticeable, as it has been since the year began. Returns for almost the entire mileage are now available for April. They show an increase of 21 per cent. in net, while the gain in gross was about 12 per cent. For the first four months of the year the gain in net was

nearly 24 per cent., while the increase of gross earnings was 9.1 per cent. Such figures, indicating careful control of expenses and showing an enlargement of the fund available for dividends, account in part for the advance in the prices of standard railway securities since February.

....The branch bank of the International Banking Corporation in China was opened for business at Peking last week. This institution was incorporated in Connecticut seven years ago. Its capital is \$3,250,000 and its main office is in New York. Thomas H. Hubbard is president. Among the directors are E. H. Harriman, Paul Morton, George Crocker, Marcellus Hartley Dodge, John J. McCook and Sir William C. Van Horne. This branch in Peking is the first American bank to join the group of British, French, German and Japanese banking institutions there.

....John Crosby Brown, the senior partner in the well-known banking houses of Brown Brothers & Co., of New York, Boston and Philadelphia, and Brown, Shipley & Co., London, died on Friday, June 25th, at his summer home in the Orange Mountains, New Jersey. Mr. Brown was born in New York on May 22, 1838. He was educated at Columbia University, from which institution he was graduated in 1859. Soon afterward he entered his father's firm. At the time of his death he was a trustee of the United States Trust Company, the Liverpool and London and Globe Insurance Company, the Bank of New York, N. B. A., the Bank for Savings, the United States Lloyds, the Ocean Accident and Guarantee Corporation, and the London Guarantee and Accident Corporation, Limited. He was a member of the New York Chamber of Commerce and treasurer of its charity fund. He was also a member of the Century Association, the Metropolitan Club, the Down Town Association and the Midday Club. He was married to Miss Mary E. Adams on November 9, 1864. She and six children survive him.

The Independent

VOL. LXVII. NEW YORK, THURSDAY, JULY 8, 1909

No. 3162

Survey of the World

Net Earnings Tax Accepted

The tariff bill amendment for a tax on the net earnings of corporations was adopted in the Senate on the 2d inst. by a vote of 59 to 11. No changes were made in the text originally introduced, of which we gave a summary last week. Eight Republicans and three Democrats voted in the negative; seventeen Democrats and forty-two Republicans in the affirmative. When the proposition was brought before the Senate, on the 29th ult., Mr. Aldrich and his associates took pains to point out that it had first been suggested by Mr. Taft and that it was an "Administration measure." The President had recommended it in a letter to the Ways and Means Committee of the House before the passage of the House bill. Mr. Aldrich frankly said that he would vote for it to defeat an income tax bill. In his judgment the tax would not be needed for more than two years to meet the deficiency in revenue. He would not favor the permanent use of any tax that would eventually destroy the protective system. A day or two later Mr. Flint said that Mr. Aldrich (then temporarily absent from the Senate) had opposed the tax in the Finance Committee, but had been outvoted there by his associates. It is understood that he urged Mr. Taft to accept a limit of two years, and that the President would not consent. During the three days immediately preceding the final vote, many speeches were made. Mr. Dixon argued in favor of an inheritance tax. Mr. Borah and Mr. Cummins spoke against the net earnings tax and in favor of an income tax, admitting, however, that there was no longer any hope of passing an income tax bill at this session. It was

asserted that the net earnings tax was inequitable because it did not touch bondholders, could be shifted to consumers, and exempted copartnerships, firms and individuals doing business in competition with the taxed corporations. It was also asserted that the measure was of doubtful constitutionality and was designed primarily to shelve an income tax. Mr. Cummins predicted that even if the tax should be added to the tariff revenue the deficit would still exceed \$150,000,000. He pointed out that the leading Republican Senators now in favor of the tax had spoken and voted against such a tax in 1898. Mr. Borah said that the publicity desired by the President was not required by the bill. On the other hand, Mr. Bourne, supporting the tax, said that it would be permanent and would serve as an entering wedge to secure complete Federal control and regulation of corporations. The leading defence of the tax was made by Mr. Root, who opposed an income tax, holding that it would be unwise to impose one. The Government, he said, ought to have power to levy an income tax, to be used in an emergency, but he was opposed to the use of it as a substitute for protective duties on imported goods. Late in the afternoon, on the 2d, the income tax amendment having come before the Senate in committee of the whole for a vote, Mr. Lodge moved to substitute for it an amendment imposing additional or countervailing duties on goods coming from countries that discriminate against imports from the United States. This motion appears to have been made for parliamentary purposes. The net earnings tax was offered as a substitute for it, and was accepted

by a vote of 45 to 31. The Lodge amendment having been withdrawn, the net earnings tax was then substituted for the income tax by another vote identical with the first. This was the test between the two taxes. The forty-five affirmative votes were all cast by Republicans. All the Democrats present, with seven Republicans (Messrs. Borah, Bristow, Bulkeley, Clapp, Cummins, Dolliver and La Follette) voted in the negative. Several proposed amendments were then rejected before the final vote. One exempting educational, fraternal and religious associations was tabled, 42 to 32. It was said that provision for such exemption had been made. Another, subjecting the fund for bond interest to the tax, was tabled, 41 to 34. In the final vote (59 to 11), the majority was increased because the income tax had definitely been laid aside. The eleven negative votes were cast by (Republicans) Borah, Bristow, Bulkeley, Clapp, Cummins, Dolliver, Heyburn and La Follette, and (Democrats) Chamberlain, Hughes and Shiveley. Seventeen Democrats, as we have said, were counted with forty-two Republicans for the tax. Three or four Democrats declined to vote. It is expected that a few changes will be recommended by the committee. Notice has been given of amendments exempting mutual life insurance companies and building and loan associations.

Course of the Tariff Debate About half of last week was devoted in the Senate to the net earnings tax, and the remainder to the tariff schedules. Mr. Tillman argued at length in favor of a protective duty of 10 cents a pound on tea, for the benefit of the revenue and of the plantation in South Carolina where 9,274 pounds were produced last year. The Senator appears to have been not entirely in earnest. He found allies on the Republican side, some of them standing for a protective duty, while others said they were willing to give the domestic tea grower a bounty. His motion was lost 18 to 25. To the affirmative there were two Democrats and sixteen Republicans, among the latter being Messrs. Root, Atkins, Bryan, Gallinger,

Carter and Dick. A motion to put cotton ties on the free list was lost, 31 to 38. But jute bagging for cotton bales was made free, Mr. Aldrich accepting a motion to that effect and thus preventing debate on the question. Mr. Bacon, of Georgia, urged that there should be a duty of 4 cents a pound on sea island (long staple) cotton, to protect our planters against imports from Egypt. The Florida Senators made the same plea, but the motion for a duty was lost. Binding twine was put on the free list; salt was excluded from it by a vote of 42 to 18, and provision was made for a duty on tin and tin ore whenever American mines shall produce 1,500 tons in a year. On the 3d, Mr. Aldrich brought forward the maximum rates, which were adopted by a vote of 36 to 18 after only five hours' debate. A much longer contest had been expected. These rates are made by adding 25 per cent. ad valorem to the ordinary duties, and they are to be imposed upon goods from countries that discriminate in any way against imports from the United States. Mr. Aldrich said they were a very important part of the tariff bill. He asserted that at present France and Germany were the only countries to which they could be applied, and he predicted that these countries would promptly so change their laws that the higher rates would be avoided. His assertion surprised some who heard it and who remembered the report from Treasury authorities three months ago that maximum rates would affect four-fifths of our imports at that time. With the addition of 25 per cent. there were special provisions for retaliatory duties of 5 cents a pound on coffee and 10 cents on tea. Mr. Root urged that these should be omitted, saying that the proposed duty on coffee might disturb our amicable relations with Brazil. His argument was effective, and the committee consented to the removal of them. To the vote of 36 to 18, four Republicans were counted in the negative. This part of the bill authorizes the President to employ experts to procure information relating to tariff duties. Some in the Senate would prefer a Tariff Commission. Mr. Culberson's motion for a bi-partisan commission of seven was lost, 17 to 44. Mr.

Dolliver's, for a commission of five, was also defeated, 23 to 28. During the debate upon the maximum rates, much was said about the McKinley treaties of reciprocity and the failure of the Senate to act upon them. Mr. Gore moved a reenactment of the reciprocity provisions of the Dingley tariff; lost, 16 to 39. The joint resolution for submitting to the States an income tax amendment to the Constitution was reported by the Finance Committee on the 28th ult.—Secretary MacVeagh recently sent to the Ways and Means Committee a letter recommending the substitution of a tax of 2 cents on all oleomargarine for the present taxes of one-quarter of a cent on the uncolored product and 10 cents on that which is colored in imitation of butter. He asserted that these duties encouraged evasion and fraud and were ineffective in promoting the purpose of the legislation. Representative Tawney now says he has been authorized by Mr. Taft to make known the latter's opposition to such a change.—At the annual dinner of the Yale alumni, in New Haven, on the 30th ult., the President, after commending Secretary Dickinson, a Democrat (to whom Yale had given an honorary degree), spoke in a humorous vein of differences among Democrats. But he would not ignore, he added, some difficulties that there were in the other party:

"I remember in 1904 that Mr. Charles Francis Adams gave what I may call a perfectly good Adams reason for the election of the Democratic candidate over the Republican candidate. He said that one of the essentials of a successful free Government was an able, patriotic, and efficient opposition, and that as the Democratic party had utterly failed in reaching that ideal, he was in favor of putting the Republican party in that place. Now, I venture to say, that while that may not be the reason which shall move the American people, it is true that if the Republican party does not live up to its promises and what the people expect of it, it will be relegated to a position like that of his Majesty's Opposition. And, therefore, I may say by way of caveat that we have troubles of our own."

Sugar Trust Officers Indicted

Indictments were returned by a Federal Grand Jury in New York, on the 1st, against the American Sugar Refining Company (Sugar Trust) and eight men for conspiracy to restrain

trade in violation of the Sherman act. The men indicted are Washington B. Thomas, president of the company; John E. Parsons, the company's counsel and a member of its executive committee; Directors Arthur Donner, John Mayer, George H. Frazier and Charles H. Senff; Gustav E. Kissel, broker; and Thomas B. Harned, who was counsel for Adolph Segal at the time of the transactions to which the indictments relate. This criminal prosecution by the Government follows the recent civil suit against the Trust for \$30,000,000, which the Trust settled in the course of the trial by paying about \$3,000,000. An account of that suit was given in these pages on June 17. In brief, the story is that Adolph Segal, of Philadelphia, who had erected a sugar refinery, became embarrassed, and procured a loan of \$1,250,000 five years ago from Kissel, a broker, not knowing that the money had really been furnished by the Sugar Trust; that the terms on which the loan was obtained permitted Kissel to name the directors of Segal's sugar company, and that Kissel named representatives of the Trust, who thereupon kept the new refinery idle. It has not yet been put in operation. The alleged conspiracy indirectly caused the suicide of Frank Hipple, president of the Real Estate Trust Company, of Philadelphia. The men accused in these indictments may, if convicted, be sent to prison. Mr. Parsons is an attorney and a millionaire. He wrote the agreement used in forming the original Sugar Trust, has been president of the New York Bar Association, is prominent in the affairs of the Presbyterian Church, and is the father of Herbert E. Parsons, the latter being a member of Congress and chairman of the Republican Committee in New York City. Counsel for the defendants claimed that prosecution was barred by the statute of limitations. The Government holds that the offence has been a continuous one.—The District Attorney at Jackson, Miss., asks the courts to restrain the Standard Oil Company from doing business in that State and to enforce the collection of \$11,000,000 in penalties incurred by violation of the State's Anti-Trust law, at the statutory rate of \$5,000 per day.

College Boat Races

At the inter-collegiate boat races, last week, all the honors were won by Harvard on the Thames and by Cornell on the Hudson. Nothing was left for their competitors at either place. At New London, on the 1st, Harvard was victorious in all of the three contests, finishing six lengths ahead of Yale in the race for university eights after examples of similar success had been set by her freshman eight and her university four. The Harvard freshmen led their competitors by more than ten lengths. In the race for university eights the winning time was 21:50. Yale's 21:10 still holds the record. The greater physical power of the Harvard eight was noticeable. On the Hudson, one day later, Cornell won all of the three contests, but at the finish in the race for university eights was less than a length in advance of Columbia, the times being 19:02 and 19:04 2-5. The other crews were those of Syracuse, Wisconsin and Pennsylvania. Syracuse was third in the great race, and second in the races for university fours and freshman eights. In these two contests the winning Cornell oarsmen lowered the time records by more than ten seconds.

Colombia's Absent President

Conflicting reports are in circulation concerning the absence of President Reyes, of Colombia, from his country. It is asserted that he sought to save his life by flight, that he took Colombian archives in twenty-one trunks, and that he had mortgaged for his own profit the customs revenue and emerald mines. These stories come by way of Panama. They also say that Vice-President Holguin will ask for his impeachment. President Reyes arrived in London on the 29th ult. He gave this statement to the press:

"The recent elections resulted entirely in my favor. After them I visited the Atlantic Coast towns and conferred with a number of prominent men. While on the coast I decided to come abroad to visit my daughter and also for the benefit of my health. Altho there is nothing seriously wrong with me, I was in need of a change of scene. I await with confidence the meeting of the next Congress. I intend to return and resume the duties of my office."

Two or three days later he explained that he had been attacked because he ap-

proved the tripartite treaty for a settlement of the Panama controversy; also that the customs revenues had been leased as a guarantee for the holders of the republic's bonds, and that the emerald mines had been turned over, with full authorization of law, to an English corporation, under a concession whose terms were highly favorable to the republic. For himself there had been no profit in these transactions. His friends (among them the Colombian Consul-General at New York and the Colombian Minister at Washington) say there is no foundation whatever for the stories coming by way of Panama. Vice-President Holguin is his intimate friend. The President's daughter is the wife of the Vice-President's son. The President has been regarded for many years as the wealthiest citizen of Colombia. It is said that he is weary of office-holding and would like to retire to private life. It is asserted that he has greatly improved the finances and credit of Colombia, enlarged the national revenues and reduced the foreign debt.—Ex-President Castro, of Venezuela, now in Spain, publishes an attack upon the United States, asserting that our Government circulates false reports that he is organizing a revolution. Its aim, he says, is to obtain possession of Venezuela. "The first attempt at expansion having failed, the American Government is preparing to deceive the world with another wicked scheme, under cover of which it can accomplish its purpose." In various ways the property left in Venezuela by Castro is losing value, and it is said that he will soon have nothing except the money deposited by him abroad. Suits against his estates for damages are pending, and the reorganization of profitable monopolies or corporations in which he had large holdings makes these holdings almost worthless.

Assassination by an Indian

A young Hindu student in London killed Lieut. Col. Sir William Hutt Curzon-Wyllie and Dr. Lalcaica at a reception in the Imperial Institute on the evening of July 1. Colonel Wyllie was sixty years old, and had been for the last eight years political aide-de-camp to Viscount

Morley, Secretary of State for India. His career had been a brilliant one both in the army, which he entered in 1866, and later as an administrator. He served in the Afghan war of 1879 and 1880 and was decorated for the part he took in the relief of Candahar. Being transferred to the political department he was successively Resident in Nipal and Governor-General's Agent in Central India and in Rajputana. His assassin is Madar Lal Dhinagri, twenty-five years old, a student in engineering in University College, London. It seems that his brother, a barrister in India, had written to Colonel Wyllie asking him to look up young Dhinagri and persuade him to break off his association with Indian revolutionists. Colonel Wyllie had a talk with him and invited him to the reception a few days later. This was held under the auspices of the National Indian Association for the purpose of promoting a better understanding between English and Indians. It was attended by about 300 persons of the two races, including many English ladies. Dhinagri had been persuaded by the agitators in London to make a hero and a martyr of himself by giving his life to free his country of one of its oppressors. He was armed with two daggers and two revolvers. Approaching Colonel Wyllie, who was talking with Dr. Lalcaca, a Parsi, he fired five shots into his head, then turning his revolver upon Dr. Lalcaca, who attempted to seize him, he shot him thru the heart. A closely written document of three sheets was found in his pocket declaring his motive for the deed. The police have not made public the contents of this paper. The assassin attempted to commit suicide, but remained perfectly calm when he was seized and disarmed, saying nothing except to ask quietly to have his glasses put on so he could see better. The murder, in London and under such circumstances, of a man who was distinguished for his sympathy for the natives of India, has brought home to the English people the seriousness of the Indian revolutionary movement. Up to the present no attempt has been made to interfere with the nest of agitators known to be active in England. The last number of the *Indian Sociologist*, published in London by Shyamaji Krishnavarma, contains the following:

"We repeat that political assassination is not murder. All unprejudiced men treat political assassins not as criminals in any way, but often regard them as benefactors of their race."

At a meeting of Indians in London held to express their abhorrence of the crime the sentiment was not all one way. A student rose in the audience and defended the act of Dhinagri, but he was driven from the hall by the indignant audience. A notebook has been found in Dhinagri's room containing the record of his pistol practice since January in preparation for the attack.

French Politics

The questions that are occupying the attention of the Chamber of Deputies now are the revision of the tariff and extravagance in the navy. A committee appointed to prepare the tariff bill reported in favor of higher duties. The committee estimated that this proposed increase would yield about \$3,500,000 additional revenue. Mr. Cruppi, Minister of Commerce, in defining the position of the Government, stated that the policy of France should be to avoid the extremes of free trade and high protection. Consequently the Government would refuse to adopt the report of the committee as a whole because France could not afford to jeopardize her export trade by entering upon a tariff war. It would be much more advisable to pursue a policy of reciprocity and mutual concessions. To give a chance for negotiations with other countries, such as the United States, the Government should be allowed a wider divergence than at present exists between the maximum and minimum rates imposed by law, but he thought that the 50 per cent. difference proposed by the committee was too high. The Government, he said, was willing to accept the report of the committee on 173 articles, which would make an annual increase of about \$600,000. The Government endorsed the proposed rates on turbines, sewing machines, electric lamps, phonographs and automobiles, which protected new industries, but was opposed to the proposed increase on duty on steel, linens, cotton, oil and other raw materials. The committee headed by M. Deleasse, appointed to investigate the conduct of the French navy, has brought in a report which exposes mismanagement, extrava-

gance and fraud of an appalling character. The committee points out that during the last ten years when France has spent \$600,000,000 on her navy, she has dropt from the second to the fourth place, while Germany, which has spent less than this, has risen from the fourth to the second. It costs France as much to build five battleships as it does Germany to build six and England six and a half. Accidents during the past two years have cost France more than the loss of Rojestvensky's fleet cost Russia. Superfluous officers, complicated business routine, bureaucratic red tape and inefficient workmanship is a constant drain upon the revenue. The six new battleships of the "Danton" type, corresponding to the British "Dreadnoughts," will cost 50 per cent. more than the estimates, and guns have been ordered for them without the models ever having been tested. The "Danton" was finally launched at Brest, six weeks after the first attempt, when it stuck on the ways, the delay and expenses making an additional cost of \$100,000 in the launching.—The Government is enforcing the law passed after the separation of Church and State which makes it a crime for a clergyman to criticise the laws and educational system of the Government. Archbishop Ricard was fined \$100 by the Correctional Court of Auch for his pastoral letter, in which he denounced secular education as anti-Christian and anti-patriotic. Six priests of the diocese who read the letter to their people were fined \$10 each for complicity. Bishop Gieure of Bayonne was convicted by default for a similar pastoral letter in which he pronounced an *ipse facto* excommunication against municipal councils and charitable associations which took possession of property formerly held by the Church. Two priests were also sentenced to fines of \$5 each for reading the letter. It is likely that the ecclesiastics will all refuse to pay their fines and will be sent to jail.

Ever since the great catastrophe Messina of 300 December earthquakes have been more frequent than they were before in the vicinity of Messina. Most of them have been slight, but

on July 1 there were thirteen shocks of considerable severity and for several days following tremors were frequent. If Messina had been in its original condition it might have suffered as much damage as before. But most of the inhabitants are living in the wooden houses built from American lumber, so the falling of the walls which had been left standing caused only two deaths. A mother who was standing at the door of a house when the shock came ran in to rescue her child, and both were crushed by the falling masonry. Seven soldiers were injured in rescuing people from the ruins of their houses. The fires started in the wreckage at various points are laid to incendiaries. The people of Messina are indignant because the officials whom the Government have placed in charge of the devastated region have failed to provide sufficient shelter for them, and at the same time will not permit them to rebuild until the plans for the future city are prepared, which may not be for several months. The streets have not even been cleaned yet. The authorities have in their hands more than \$2,000,000 worth of money, jewelry and securities found in the ruins of Messina and unclaimed because the process of identification and proving ownership is long and complicated. When the naval bill came up in parliament the republican and socialist deputies attacked the officers of the navy for their inefficiency at the time of the earthquake, leaving the Russians, French, English and Americans to do most of the relief work.

Persian Troubles The grip of Russia on Northern Persia is constantly tightening and the struggles of the Constitutionalists for self-government serve only to make the need of foreign interference more apparent. The Constitutionalists of Kasbin, between Teheran and Tabriz, have announced their intention of coming in force to the capital to overthrow the ministers, whom they suspect of betraying the country into the hands of the Russians. They say that the lives and property of foreigners have hitherto been safe under native protection, but if foreign troops are brought in by any Power, it must be

responsible for the safety of the foreign residents. The Bakhtiari tribesmen, who have been wavering in their allegiance for the past six months, are now marching on the capital in support of the constitution. The Shah has no native troops on which he can rely, so the defense of Teheran rests solely with the Russian officer, General Liakhoff, who has enlisted in the service of the Shah and has about 750 Persian Cossacks under his command. The foreign residents also look to him for protection, but whether he will be able or willing to ward off the advancing forces of the Constitutionists remains to be seen. The Shah, a few months ago, consented to restore the constitutional *régime*, and since then the ministry and committees have been wrangling over the election law. The new law makes the Chamber more representative than formerly by increasing the number of members from the provinces, but this provision is in part neutralized by the clause which allows a province to elect non-resident delegates, thus giving the capital a chance to retain its former dominance. Nasir-ul-Mulk, who has been recalled from exile to become the head of the new ministry, has twice refused to return, apparently regarding the time as unfavorable for the establishment of popular government. Russian troops are said to be concentrated at Baku, with transports ready to take them across the Caspian, for the occupation of Teheran in case there should be sufficient disorder there to serve as an excuse. This has already been done in the case of Tabriz, which General Snarsky holds with a body of Russian troops. But his rule has been so oppressive and unjust as to unite all factions against the Russians, and the garrison in Tabriz has been fired upon at night. Another complication has been added to the situation by the action of the Constitutionalist leaders, Satar Khan and Baghir Khan, who held Tabriz against the Shah's troops until the Russians took possession. They have taken refuge in the Turkish consulate at Tabriz and have made an appeal to the Porte for protection. Since Turkey feels hurt at not having been consulted when Great Brit-

ain and Russia divided Persia into a Russian "sphere of influence" on the north and a British "sphere of influence" on the south, the Sultan may be inclined to listen to the cry of distress from Mohammedans likely to lose their independence.

Foreign Notes

General Botha, Premier of the Transvaal, who is going to London to secure the approval of the Imperial Government for the constitution recently adopted by the South African Union, will open negotiations for the acquisition of Rhodesia by the Union. It is reported that he will be prepared to offer \$100,000,000 for that territory. It may be that the Chartered South African Company will retain possession of Northern Rhodesia and the territory south of the Zambesi be annexed to the Union.—The preliminary agreement recently concluded between China and Russia in regard to the administration of the Russian towns in Manchuria has met with a protest from Great Britain, Austria-Hungary and the United States, which claim that laws affecting the right to reside in the international settlements in China must originate with the treaty powers. China has in view the abrogation of the right of extra-territoriality, which excludes foreign residents from the legal jurisdiction of the country. One of the first acts of Japan after demonstrating her military power to the world was to secure release from this offensive arrangement. Apparently Russia believes it good policy to aid China in the abolition of extra-territorial rights, and the agreement between these two Powers has practically that effect. Another question of international rights in Manchuria relates to the opening of the Amur, Ussuri and Sungari rivers to international trade. According to the treaty of Aigun, these rivers are closed to all but Russian and Chinese vessels, but the Portsmouth treaty and the conventions resulting from it, as well as the open-door declaration elicited by Secretary Hay, apparently open the rivers of Manchuria to the ships of all nations, and Japan is especially eager to tap these rich grain fields.

The Unrest of Modern Woman

BY SUSANNE WILCOX

ON every hand modern woman shows signs of unrest and seems secretly or avowedly dissatisfied with the time-honored, circumscribed sphere of the "womanly woman." This is true in spite of the fact that the old-time gentlewoman is still much lauded, and the tentatively progressive woman of almost every sort is much inveighed against. It must be confessed, however, that in the voluminous discourses against the "modern woman" little account is usually taken of the deep-rooted, fundamental conditions developed in the course of social evolution, which are responsible for this widespread and growing unrest.

Two classes of women generally escape censure: the poverty-pinched drudges who are forced to serve as wives, mothers and bread-winners, because wedded to incompetent or indigent husbands, or to workmen who are unable single-handed to keep the wolf from the door; and the plain housewife, who strictly attends to household duties without aspiring to have pursuits or interests which overlap those man has long claimed to be exclusively his own. A mere glance over the great majority of modern women convinces one, however, that the plain housewife is rapidly disappearing, and is being superseded by a conspicuous minority of restless, ambitious, half-educated, hobby-riding women on the one hand, and by the submerged majority of sober, duty-loving women on the other, who are nevertheless secretly dissatisfied with the rôle of mere housewife.

And, strange as it may seem, not only the plain housewife, but the privileged "lady" is also become disaffected, and for her there is perhaps least sympathy. Originally "lady" meant the one who baked the bread, but in the course of social evolution it came to mean the one who neither baked nor did any other useful service. Until a very recent period the ideal lady possessed personal charm and beauty; learned all the subtler arts of conversation and idleness; had no duties which involved personal service, ex-

cept to her lord and master; and was wifely, *i. e.*, possessed a modicum of the virtue with which tradition endowed the angel. Her mental development was restricted to teachings which tended to make her docile and decorative, and if she ventured to reach beyond this intellectual boundary she transgressed the traditional laws of womanliness.

In short, while man's habits and education have tended to give him mental discipline and scientific methods of work, the training of woman still tends to develop her feelings (the heart) at the expense of all else. The result is that her natural emotions—love, hate, envy, jealousy, and temper—modified by subtlety and subterfuge (the pre-eminently female characteristics in the animal as well as human world) are highly developed along with self-sacrifice, patience, long-sufferance and timidity. And the inveterate claim of man has been, and still is largely true, that woman is an instinctive and intuitive being, and is not yet become a thinking, reasoning one. Clearly the rôle of "lady" has developed a code of morals which are strictly domestic, and woman's primary impulsion—even exceeding that of motherhood—is to win, please, cajole and minister to the husband; while man's morals have become largely public and industrial.

Now if women had persistently been educated in convents, and taught nothing beyond the refinements of life, they might perhaps have remained docile and content. But the average young American woman, especially if college bred, leads a life of mental untidiness and progression abreast with young men, up to the time of marriage. Many of the higher occupations have been thrown open to her, and if she does not find a congenial mate early in life, she avails herself of these opportunities and finds much satisfaction in useful employment and pecuniary independence. But such women, who abound in America, are often nevertheless restive and acquire all sorts of idiosyncracies, and physicians

tell us in time develop organic and nervous diseases or become apathetically unsexed, largely because they lead abnormal, unnatural lives, repressing their reproductive impulses.

After marriage the man's course in life is continued aggression, acquisition and competition, involving a thousand public and industrial issues, which absorb his chief interests; while the course of the married woman, no matter what her talent or previous training, becomes generally one of social and mental inhibitions. Forthwith she must lock-step with all other respectable married women; sink or conceal her talents, unless they be in the nature of accomplishments; and short-chain her interests to meet the requirements of conventional, domestic or decorative life. This doubtless is why after a lapse of years, when the glow of love has cooled, mental incompatibility often develops, and marriage rarely fulfils the hopes of youthful enthusiasm and passion, although married couples are usually eager to screen their incompatibility. Discontent is especially prevalent among women who have tasted economic independence and the satisfaction of financial acquisition. To many such women their cup is not without gall, when suddenly they become dependent upon the bounty or niggardliness, as the case may be, of the husband. How many of us have heard the modern bourgeois husband, drunken with the consciousness of his possessions, vaunting his generosity and magnanimity by declaring that his wife and daughters may buy anything they wish—as tho buying, or possessing things bought, were the *summum bonum* of life—yet tyrannically decreeing that they restrict their activities to domestic and ornamental life. And, again, we have all known the husband who draws the purse-strings so tight that the wife has been driven to pick his pocket for a little pin-money.

The desire to participate in what men call "the game of life" has fastened itself upon many modern women, and their appetites are whetted for more abundant and diverting interests than the mere humdrum of household duties. Probably the fact that the churches offer opportunities for the feeble indulgence of these tastes, more than religious zeal, explains

why women have monopolized most of the church work, and dote upon fairs, bazars, rummage sales, church suppers, and musical and histrionic entertainments. And in all likelihood this also accounts for their flocking to women's clubs and collectively dabbling in all the arts and sciences, acquiring still more superficial habits of mind to add to a preliminary impractical and unassimilated education. Yet none are more keenly aware of the vapidness of these semi-social-intellectual diversions than the majority of these clubwomen themselves. But their usual sophistry is "It is better than nothing, and what else can we do?" Doubtless, moreover, this is why the modern society woman, altho often pampered and permitted to fritter her time in luxurious indulgences and gaieties, while her husband may be working from dawn until dark to keep her abreast of her compeers, is nevertheless complaining and dissatisfied.

Only recently a distinguished professor—who, I infer, believes that in order to solve the woman question, women must learn to emulate their grandmothers, be more content, and bear more children—gave me an excellent illustration of the lamentable refractory tendencies and secret discontent of present-day young women: Two excellent student girls, after graduating from college, returned to a home of luxury, where every material desire could be gratified. They had social position, and, after leading brilliant ornamental lives for several years, and no satisfactory opportunity of marriage having come to either of them, they became extremely discontented. Indeed, the learned professor was much shocked when these fortunate young women protested bitterly at the futility and vapidness of their lives, and declared that they would gladly abandon all their luxuries for the privilege of leading really useful, active lives. The professor remonstrated with them kindly and recommended that they do a little genteel charity work in their community. Very likely, however, these same young women had previously been taught by one of the professor's colleagues that the indiscriminate charity of well-meaning ladies is today considered a great detriment to society.

The present conditions among modern

women are perhaps best summarized by Professor Thomas in "Sex and Society":

"The American woman of the better classes has superior health and is doing well because of working herself to death—not more specifically troubles, but because she has lost her connection with reality. Many women, more intelligent and energetic than their husbands and brothers, have no more serious occupation than to play the housewife, with an attendant circumstance that none of them are not plagued with the system entirely. It is due solely to the inhibitive effects of early habit and suggestion."

Yet how Americans love to boast of the "freedom" and advancement of their women! If they restricted their boasting to the indulgence of young, unmarried women and children, the world would unquestionably agree that none are so privileged and pampered, and doubtless, if frank, would add that none, as a class, are so ill-bred. Because of romantic love as the basis of American marriage as against European property marriage, the American wife generally becomes pecuniarily dependent. And, inasmuch as there are no hide-bound class distinctions to prevent her from leaping suddenly from the lowest to the highest social ranks, there are consequently a very large proportion of them restricted to conventional, refined living, *i. e.*, they may not reach out and participate in any industrial pursuit, and remain highly respectable.

In Europe the upper class women are provided with dowries. They have therefore the satisfaction of pecuniary independence and of contributing directly to the support of the family. Among the middle and lower classes we find a very large percentage co-operating with their husbands in business, and their children are, in general, as well or better trained and cared for than American children. Recall, for example, the myriad of irresistible little shops all over Europe, with the dwellings above or in the rear, which are managed conjointly by man and wife. Again, consider the European small restaurants—those charming, little, spotless establishments where one almost invariably finds well-cooked and inexpensive food, the like of which is not to be found in America. During the hours of serving meals the wife, dressed modestly but faultlessly, is at the desk, while the hus-

band is supervising the seating and serving of the guests. During the intervening hours they plan and advise with the head cook and head waiter, and the woman never fails to find time to look after their private apartment and flock. In the smaller village inns, the wife herself does the cooking and the husband serves the guests. There is, of course, greater economic stress in the Old World which often forces wives to a burdensome co-operation, but this is a problem which must be coupled with that of the oppressed lower classes. It is, however, unquestionable that the wife, who by reasonable collaboration obtains more or less domestic and economic independence, is better satisfied than the one whose activities are restricted, and who is economically independent, even tho surrounded by luxury.

The average middle class American wife of the village or city—thanks to modern labor-saving inventions—has a varying amount of leisure which she devotes vicariously to self-adornment, fancy work, the amateur practice of music or painting, church industrial or dramatic enterprises, or to a hodge-podge study and entertainment in woman's clubs. Yet her leisure occupations do not satisfy her. If this ability and enterprise were scientifically and systematically trained and applied to worthy, practical achievement and social usefulness, it would doubtless improve the condition of woman, and would contribute to the betterment of society, and to the care and welfare of the family.

Two of the best mothers I have ever known were women who combined outside labors with their domestic duties. The one has unimpeachably reared five children, mainly without the aid of a servant. She is a faultless housekeeper, and has by common consent of her community accomplished more, in a quiet way, toward the civic housecleaning and improvement of a dirty, corrupt, Middle-Western town than any other citizen in it.

The other woman has creditably reared a family of eight. Besides housekeeping, sewing and supervising the school work of each of her children, this woman, during twelve years, supplemented her husband's modest earnings by managing the village post office, and later transferred her outside activities to managing a small

farm on the outskirts of the village. Of course, two hands and one head were not able to accomplish all this unaided. Her brood was a lively household regiment of trained workers and economists. Each from five years on was assigned certain duties, and in compensation received ample time for play and a small graduated salary with which to pay and manage in the main his personal expenses.

Certainly in the work which belongs pre-eminently and indisputably to woman little scientific progress has been made. Our schools and colleges are doing almost nothing to educate and fit women to perform the tasks for which they are fundamentally destined. Children are born and bred generally in a primitive, haphazard, burdensome fashion. Indeed, there is no more grievous protest than that of the so-called educated young woman, who, upon the coming of her first child, searches in vain amid the knowledge she has acquired for light and guidance to aid her in the supreme task of her life.

From the moment when her child is born she is continuously, and usually blindly, experimenting; rarely certain she is doing the right or best thing for her child. Moreover, in the ceaseless, unremitting watchfulness of the mother during the first years of the child's life, which so frequently saps her strength and nervous energy, there is much waste. If every child could be deposited a few hours daily in a well-equipped community or co-operative nursery in charge of a trained nurse, who could give the mother expert advice and assistance, doubtless, in nine cases out of ten, the results to the child would be infinitely more satisfactory than under present methods, and mothers would not so frequently be careworn and nerve-shattered. Indeed, when one realizes how great is the ceaseless strain and anxiety forced upon average mothers, one ceases to wonder why the bearing and rearing of children is become so unpopular alike with men and women.

The solution of the harrowing servant problem ought also to belong to woman. Unquestionably as time goes on there will be fewer servants; and, except for a limited number of labor-saving household improvements, little advancement has

been made in methods of housekeeping. The farmer sows and reaps his grain riding on a two-horse machine; but the farmer's wife cooks, sews, keeps house and raises children about in the same haphazard, primitive fashion as her great-grandmother did, with no time or energy left to think of improved method or co-operation.

The average town woman, however, has leisure, and, while common prejudice and case-hardened conservatism permit her to co-operate with other women in the pursuit of much superficial and indiscriminate learning, it would not permit her unchallenged to co-operate with other women in practical, remunerative effort, or experiment with community nurseries, kitchens, kitchen gardens or cooking shops. We have had in America no sustained effort at reproducing the great cooking plant of Berlin, where food is prepared scientifically and attractively, and delivered promptly and systematically from heated wagons, to hundreds of people daily, at a minimum cost. Yet perhaps no other people is today suffering so much from lack of private cooks or good public eating places.

Of course, the widening of all privileges, social, industrial and political, for women in America, must be made slowly, for not only is the bulwark of our prejudice great, but women in general are not ready for them; and they themselves are most active in policing the traditional restricted conventions. There is still a commonly prevalent notion that women who reach beyond a strictly household or ornamental life necessarily become freakish or unfeminine; also that with widened social and industrial activities for women, the charm of sex differentiation, and romantic love as the basis of marriage, would soon be eliminated. Indeed, the average man still clings tenaciously to the concept of woman as little physically and mentally weak and dependent, and fitted primarily to fill his play hours, at least until after courtship. This conviction has become as ingrained in him as the taste for adornment and coquetry in woman, and may not be wholly ignored. Nevertheless, the youthful ideal of woman eventually becomes shattered for nearly every man after marriage; and most frequently he turns

to the society of other men for relaxation and satisfactory diversion. In spite of the common extolling of American women, the average American man in his moments of candor laments that he finds married women, in general, dull and uninteresting, after the charm of girlish coquetry has worn off, inasmuch as their mentality seems rarely developed beyond the high-school stage, and their tastes and interests are confined to household routine, dress, bridge, small social and literary functions, and puerile business enterprises in the churches. In the great and vital social, political and industrial problems with which men are mainly concerned, American women rarely have any insight or interest.

As for the growing body of modern thinking women, they are not asking to break radically with their past; for of

course the traditions and institutions of ages cannot be ignored. Nor do they wish to cease to become wives, mothers and housekeepers. It is merely that they chafe under the present system of semi-social, industrial and political freedom, and find the shackles of half broken-down conservative ideals of feminine respectability dull, heavy and a great stumbling block to worthy progress. And it seems clear that only when men, who are still the masters and dictators, abandon their conventional prejudices and angel ideals, and treat women like natural, capable beings, will women in turn measure up to the standards required of them and become vastly more useful, interesting and companionable for the lifelong stretch. Then also will the institution of marriage become more stable and more generally satisfactory.

Use of the Tariff Free List for National Protection

BY PORTER J. McCUMBER

UNITED STATES SENATOR FROM NORTH DAKOTA.

THE first great sovereign duty, a duty transcending all political fealty and partisan affiliation, is the duty of the Government to subserve the interests of the people. As the first duty of the head of the family is to safeguard the interests of the generation that is to succeed him, so the highest and most sacred duty of the Government is to conserve, not alone for the next generation, but for all future generations, undiminished, except so far as may be necessary for the present, the great resources of the country. I have no patience with the doctrine so often preached that we owe nothing to the future. This is not our country alone. It belongs to our children's children. We have the right to use it, but not to destroy its use to them.

Great Britain supposed that with her coal and iron she would be able to rule the markets of the world forever. To-day her mills are empty. Her alms-

houses are filled to overflowing. Why? Because of the exhaustion of her available coal and iron. She must now go so deep into the bowels of the earth that the added expense of those two great products upon which she depends renders it impossible for her to produce at her old rates and her markets have left her. This is an answer to those who say, "Let each generation take care of itself." Great Britain is in the position where we will be the moment we have exhausted our natural resources.

I have heard the idea of our inexhaustible natural resources advanced ever since I can remember. It has been preached up to the present. Now, it has suddenly dawned upon us that those resources can last, at the best, but a few years more. The people most directly interested were the first to discover that there was a shortage. They began working, night and day, to get hold of all the available coal and oil and iron

fields and all the great forests of the country. Too late we realized that our resources were about exhausted, and that while a little remained it was in the hands of a few for commercial profit.

After we had denuded the old White Mountains of their forests, after we had destroyed the timber on the Appalachians, after the farms were being washed away and destroyed and fires had made deserts of this section, we realized our extravagance and a bill was introduced in Congress to reforest the mountain chains and restore the old conditions, at a cost to the Government not of millions, but of billions, of dollars.

The most ardent protectionist believes that some articles should be upon the free list. Some believe that the greatest good to the greatest number demands that certain raw material should not be obliged to pay duty. I believe that the interests of *all* the American people demand that certain of our great resources, now being rapidly exhausted, should be conserved as long as possible by allowing the free importation of like products—that such a use of the free list means the highest national protection.

In responding to the duty imposed upon it by the American people to revise the tariff, Congress was charged with three particular things. First, and superior to everything else, was the question of protection. Whatever was done must be done under the banner of protection. The second was that, where it was possible, we should revise downward, always maintaining a sufficient wall against foreign importations to protect the American manufacturer, the American farmer and the American laborer. The third duty was to raise a revenue sufficient to conduct the affairs of the Government when economically and properly administered.

If freed from every other proposition, revising the tariff downward would have been a very simple matter, to be disposed of in a short time. That method was indulged in in 1894. We revised the tariff downward, and the result was instantaneous. Every industry in the United States immediately went downward. One-third of them went into the dust, never to revive again until the law was changed. The other two-thirds wor-

ried along in a crippled condition until a Republican administration was again put in power by the vote of the American people. That simple method of revising everything downward left its wake of destitution from the Gulf to the boundary line, from ocean to ocean. Every industry in the country felt the depressing influence.

Many highly protective duties are voted into a tariff bill on the theory that they are tariff for revenue only duties.

Every tariff which operates to protect any industry from foreign competition is a protective tariff—whether it be 5 per cent. ad valorem, or 500 per cent. There is no use in hiding behind the terms of it and calling it a tariff for revenue only. Every tariff is a tariff for revenue, and every tariff which protects is a protective tariff. But the policy of protection should be applied to all the American people, because we are all producers and we are all consumers, and the policy, properly administered, must help the producer on one side, who becomes the consumer on the other side. I have never found a policy of the Government which helped one class, which did not also help the other classes of the American people. Every thinking man knows that the value of any product is fixt by the demand in the field of consumption and not by its value in the field of production. If there are destitution and poverty in the field of consumption, high prices cannot be obtained in the field of production. If the farmers of this country raise wheat for a home consumption which will take every bushel of it, they are far better off than if they have to force their product into foreign markets—and I hope the time is not far distant when we will not export one bushel of grain or flour. On the other hand, if the farmer's crop fails, or he obtains poor prices, he is just that much crippled in purchasing the products of the manufacturer, who suffers accordingly. So that a policy which deprives the manufacturer of protection and closes our mills, pauperizing one part of the population, causes the farmer to suffer just to the extent of the injury inflicted on the manufacturing class.

It is important that this fact should be constantly in mind, in connection with the principles which constitute the founda-

tion of the doctrine of protection; for there is a limit beyond which the principle of protection becomes a menace to the nation and where free trade should be applied as the highest form of real protection. The fundamental principles of protection are, first, the development of an industry which is capable of development. If, for any reason, an industry is incapable of development, there is no reason in the world for having a protective duty applied to it. If an industry has reached the limit of expansion and, by reason of the exhaustion of its raw material, is nearing a state of extinction, the principle of protection has no further application whatever to that industry.

The second principle is, that by the development and expansion of an industry there will ultimately follow a decreased cost to the consumer. The consumers of any one article must always greatly exceed the number of producers of that particular article, and a system which will continually compel the greater number to pay tribute to the few, without a corresponding benefit, is inequitable and unjust. The compensation to the consumer for paying more to the producer than he otherwise would, today, on account of protection, is that he will be called upon to pay a less price than he otherwise would, tomorrow. Protection is not applicable to an industry which does not respond to this rule.

So far, in the history of protection, almost every industry has responded to this idea, resulting in such diminished cost to the consumer that today all of the comforts and nearly all of the luxuries are within the grasp of men and women of moderate earning capacity; in other words, a given amount of labor produces more comforts and luxuries in America today than anywhere else, or ever before in the history of the world. This fact will be vividly brought home to us the moment that the result of any tariff revision is to crowd an industry out of existence. But whenever, by reason of the exhaustion of the raw material, the price must, of necessity, constantly increase, the claim for protection ceases upon the fundamental principles stated.

The third great principle of protection is that it gives employment to our own

people. But here again it can only be justified when the employment can be retained by the aid of protection. There is no economic gain even to the laborer in the individual industry, in a policy which decreases the opportunity for future employment by the increase of present employment. It is no principle of protection to sacrifice the future to the immediate present. So, from each and all of the principles of protection, the inevitable deduction is that no resources of the country which, when once utilized, cannot be reproduced, and which are certain of exhaustion in a few years, should be protected against importations; and no tariff should be levied on coal, oil, iron or timber, because such duties contravene every principle of the protective policy of the nation:

First, because the production is incapable of expansion without corresponding exhaustion.

Second, because as we near exhaustion, the values will necessarily increase and cannot decrease.

Third, because instead of increasing the employment of labor, the final and near result is to discontinue the employment of labor entirely.

The iron, timber, coal and oil, in this country, are certain of exhaustion within a very short time, and the values will necessarily increase, instead of decrease, and the more we hasten the exhaustion by prohibiting importation, the more we hasten the ultimate result—the entire discontinuance of labor upon those industries.

Even at the present rate of consumption, which is rapidly increasing, our coal supply cannot last over a hundred years, according to the best authorities; the available iron ore not more than fifty years, the lumber supply not thirty years, the oil not more than from twenty to fifty years, according as new fields may be discovered in other parts of the country. Of course the complete extinction of these products will not occur, but it will be because the approaching exhaustion will send the prices so high that the American people will be forced to discover and utilize substitutes. That is the only thing, except importation, which will prevent the utter exhaustion of our forests, for example, within thirty years.

The only limit to ascending prices will be the ability of the people to purchase. Few people, even among regular buyers, realize how lumber has increased in price, thru exhaustion, during the last few years. White pine, for instance, has risen all the way from 88 to 189 per cent. The cost of production has not increased, at most, 25 per cent., and the tremendous difference largely reflects the diminishing supply and represents the increased profits either of the manufacturer or the original owner of the timber.

But more important than the increasing cost to the consumer, irrespective of the tariff, is the loss to the nation of its forests. We are suddenly awakening to the threatened disaster and casting about for methods of restoration. But the forests were made by Nature, not by man, and in my opinion the law which governed in their creation must also govern in their re-creation. Our feeble efforts, tho taxed to their utmost, can accomplish but little against the destruction which is going on. The only way on earth to keep our forests is to use from them only that which has attained its growth and preserve the rest from the ravages of fire and the more persistent ravages of the lumber interests.

So intense is our natural inclination to meet what we assume to be our present needs, and to add to our wealth, that all the lessons of history, of every country of the world, seem to be of no avail. Great portions of Africa, once wooded, are now desert wastes. The same thing is happening in India and China. As the forests are denuded the floods are let loose and waste—eternal waste—is the penalty. The destruction of the timber lands of the Adirondacks, the White

Mountains, the Appalachians, has carried with it the destruction of millions of acres of rich farming lands. The Kansas River floods in 1903 destroyed \$20,000,000 worth of property and a hundred lives. Every foot of lumber imported means a foot of lumber saved to the forests of America.

There are principles underlying the policy of protection from which we can never get away. Applying those principles to iron, coal, oil and lumber, we can find no basis for the application of the policy, because a duty retarding the importation of those products is in contravention of the fundamental principles of protection, and the free importation of the products is the greatest safeguard and the highest protection to the nation. In other words, more important to the people of the United States than all other questions, is the conservation of our forests.

We do not own in fee the territory constituting our country. We have only a life interest in these great resources, a right to use them, but no right to protect them out of existence, for the profit of the present generation. We cannot justify ourselves in deforesting the American continent, with all the attendant evils. We cannot justify ourselves in hastening the exhaustion of any of our natural resources for the benefit either of the great interests or of the laborers employed today; but so far as the free list will aid in retarding this exhaustion, for the benefit even of those laborers, as well as for the just claims of posterity, every principle of real protection demands the free importation of these products.

WASHINGTON, D. C.

Why Liberia Wants America's Help

BY WALTER F. WALKER

[Now that the American Commission is on its way home from Liberia to make its report to the Administration, the following article is of much interest. Mr. Walker is a teacher of mathematics in the College of West Africa, in Monrovia, Liberia.]

FROM the time Liberia was founded in 1822 by the American Colonization Society, up to the outbreak of the Civil War, she had a prominent place in the mind of the American public. Since this war healed the breach which threatened to sever the United States asunder, there has been a most wonderful and rapid jump in material prosperity. During this unparalleled period of national evolution, Liberia was almost forgotten; at least she dropped out of sight as far as the average individual is concerned.

In the meantime the colonial possessions of France and England in West Africa began to assume a more significant place in the national life of these countries, as markets had to be secured for their surplus products. Both of these nations have territory contiguous to Liberia, and consequently they became directly concerned in the affairs of this little republic. France has been secondary while England has played a most important part either directly or indirectly, in the activity and destiny of Liberia since 1871, when the ill-fated loan of that year was floated in London. The hardly less indiscreet loan of 1906 so involved England and Liberia that the former has arrogated to itself almost the power and right of a suzerain. The Liberians are intensely patriotic and will loudly, if not effectively, resent any attempt at encroachment upon their autonomy. If the Liberians are super-sensitive as regards the action of Great Britain; if they are suspicious of her when she virtually begs this republic to permit her subjects to help put her house in order; if they fear the English after they are once in Liberia; the facts may justify their apprehension and dread, especially when the recent actions of the representatives and subjects of England are considered. England, as well as every one of her subjects in the employ of the Liberian

Government or who is doing business in Liberia, protests that she has no ulterior motive in her relations with Liberia; that her desire is simply to assist the republic in organizing and maintaining an orderly and stable government; that she already has enough territory to control. The English press echoes the same sentiment. Major Cadell, commandant of the Liberian Frontier Force, offered to organize a well-disciplined police force for Monrovia, to fix and clean up the streets of the city, all for nothing. He had actually been appointed Police Inspector, Street Commissioner and Tax Collector by the Mayor and Common Council of Monrovia. This was a little too loving on the part of the Major. The people protested—and loudly, too—so the Mayor and his advisors thought it safe to revoke the commission of Cadell.

All the while protesting no designs upon Liberia's standing as an independent state, England has been gradually absorbing her territory on the northwest. In the last boundary treaty, when the Mano River was made the dividing line between Liberia and the British colony of Sierra-Leone, England claimed the right of possession of the whole of this river, notwithstanding Liberia's protests and the precedents established by international law that when a river forms the boundary between two countries the right to the use of the stream belongs alike to each country. Contrary to treaty stipulations England has seized the Kanre Lahun district on the ground that Liberia is unable to control the natives of that section. These natives claim allegiance to Liberia and have been peaceful and law abiding. Kanre Lahun is an important gateway to the trade of that part of the interior and for this reason England is anxious to have this section annexed to Sierra Leone. England knows she has no right to this territory and has offered to give to Liberia in ex-

change for it a large, barren and less thickly populated section southeast of Kanre Lahun.

France has usurped Liberia's territory as well as England. She forced Liberia to give up the San Pedro country on the southeast, has taken some in the north, and in the last delimitation, which has just been completed but not ratified, has appropriated about one-third of Liberia's total area on the north and southeast. In all these cases Liberia has given up her rightful territory under duress. The Liberians are placated; they are deluged with courtesy and honeyed words; their commissioners and delegations are kindly treated by these nations; the executive government is flattered; and all the while Liberia is being cupped and bled and told that it is only for her good. If France is allowed to take Liberia's territory, England is determined to get her part. In view of these facts the Liberians are justified in being apprehensive about their independence.

When Liberia contracted the loan of 1906 England tightened her grip on this country. She then assumed the role of a suzerain and began to make demands for certain reforms. France in a sort of indefinite way seconded these reforms. The British Consul-General at Monrovia, Braithwait Wallis, reminded the executive government of those reforms in an open letter in January, 1908, recapitulated by him as follows:

(a) The appointment of a financial expert who will place the finances of the country on a sound footing and will advise the Secretary of the Treasury on financial matters.

(b) The establishment of an efficient, well armed, and well disciplined police force under competent European officers; and one that will command the respect of the Powers.

(c) The appointment of at least three more European customs experts.

(d) The reform of the judiciary.

"European" in the above must be interpreted as meaning "English," as only Englishmen have been employed in the service of the Liberian Government under the acts creating the reform organization. His Majesty's Consul-General demanded that these reforms be carried out within six months after date of the letter. If they were instituted His Majesty's Government would be glad to suspend the pressing of its monetary claims against Liberia and to settle also the long

disputed question of the navigation of the Mano River. Moreover, His Majesty's Government would be pleased to *lend* Liberia the necessary officers to successfully execute the reforms. If they were not instituted, however, within the time set, England would not think of further guaranteeing Liberia's independence.

The financial adviser was appointed in conformity with the demand. The organization of a police force for the frontier was undertaken and three British officers employed to drill the soldiers and construct barracks. The three new customs officers were also secured. In all there were seven British subjects in the employ of Liberia, two of whom were drawing a larger salary than the President of the Republic.

It was in the execution of the duties of these men that trouble arose which culminated in the dismissal of two of the British officers in the frontier and the falsely circulated rumor of a revolution. When the barracks had been nearly completed Major Cadell, who was in charge of the barracks, began to act as though he were in the service of the British Government, instead of Liberia, and obeyed orders from the British Consul-General rather than from the proper officials of the Liberian Government. He disobeyed orders of the President of the Republic in that he enlisted, contrary to instructions, a large number of British soldiers other than the few drill sergeants from Sierra Leone which were allowed him as help. Major Cadell had a free hand in the organization and management of the barracks, and spent nearly \$75,000, much of which is unaccounted for.

The customs department has had a more placid career under the supervision of W. J. Lamont. There was much dissatisfaction, however, among the people when Mr. Lamont, as financial adviser, attempted to assume his duties. This resulted in the resignation of the Secretary of the Treasury, which was subsequently withdrawn. The duties of the financial adviser appeared too comprehensive and were interpreted as virtually absorbing all the functions of the Secretary of the Treasury. Customs duties were made payable only in English, American and German gold and English

silver. Liberian silver was not acceptable which fact has served to depreciate the Government's money.

The demand for a reform of the judiciary was based upon the plea that Liberian judges were corruptible and unfit for office, and that foreigners could not obtain justice in the courts. The records of the courts do not indicate that such a charge is a just one. During the last twenty-five years there have been fifty-two cases in which foreigners have been involved; twenty-nine of these were decided in favor of the foreigners, fifteen in favor of Liberia; the remainder were either remanded for retrial or sent up to the Supreme Court.

It is a question as to whether British subjects are capable of executing the necessary reforms in this, a republican form of government. Trained as they are in a monarchical country and in colonial service of the same, they do not comprehend thoroly the principles of a representative democracy. They are dictatorial and autocratic and therefore fail to understand institutions where the people rule. This has been verified in the actions of Englishmen on the ground. Their reform methods smack of the British colonial policy, and will not do for Liberia.

Liberia has now turned to America, after whom she is modeled. American institutions are reproduced here in miniature. The American Commission recently appointed by President Taft is in Liberia investigating conditions. The members will see the needs of this Republic and make a report. No one knows exactly what the American Government will do for Liberia. That depends upon the findings of the commission. The

people know what they want and have asked for those things. The average individual would like for America to take over Liberia as a colony. President Barclay recently sent out a circular letter to most of the leading men of the Republic requesting opinions as to what was best and most needful to ask of America thru the Commission. The replies vary in length and detail, but the consensus of opinion may be particularized under the following heads:

To ask the Government of the United States:

- (a) To guarantee Liberia's independence.
- (b) To secure the consent of the other nations to submit all questions of an international character to arbitration.
- (c) To advise the Liberian Government in all important matters which might entail international complications.
- (d) To establish a coaling station somewhere on the Liberian coast.
- (e) To lend Liberia experts who will develop all the departments of Government along the best and most modern lines.
- (f) To float a loan which shall wipe out all the indebtedness of Liberia, thus consolidating her debts.

Capitalists are asked to invest money in this country in order to develop its resources. Many would like to see Liberia taken under control and tutored much on the same lines that Cuba was helped. The work needed here is reorganization and construction. The people are ready and eager for reforms but they need leaders who are in sympathy with their institutions. America is their last hope, and if nothing can be done by her, the old patriots will despair and forsake the ship of state. They have said so. For then English occupation would be certain. They could not bear to see the Lone Star hauled down unless more stars went up in its stead.

MONROVIA, LIBERIA.

Westminster Palace and Westminster Abbey

BY JUSTIN MCCARTHY

AN important crisis has just been reached in the history of Mr. Lloyd-George's great financial scheme, the most important budget laid before the House of Commons for many years past. The second reading of the measure was carried in the House of Commons by a majority of 157. This would have been, in the ordinary course of events, a very satisfactory and encouraging result for the Liberal administrators. But, under existing conditions, the result of the division is to them a distinct discouragement.

The Government has lately carried several critical divisions by much larger majorities, and the country has now to contemplate this evidence of a falling off in the predominance of the Liberal votes. This falling off is obviously due to the course taken by the Irish National party, who, acting on an agreement among themselves, went into the Opposition lobby when the division bell summoned the House to a decision. The Irish National members had unquestionably some direct objections to the manner in which Mr. Lloyd-George's measure proposed to deal with certain Irish interests, but I feel well convinced that these objections were not the only reasons for the vote against the second reading.

The Irish National party had for a long time been complaining of the manner in which Mr. Asquith's administration has been dealing with Ireland's great national demand, the claim for Home Rule. Since the death of Sir Henry Campbell-Bannerman, no firm promise has ever been given by the Liberal administration that Home Rule should be one of its earliest measures, and that the carrying of such a measure should at the earliest possible hour be the work of the Liberal Government. I think I may take it for granted, therefore, that the Irish National party will act on all possible occasions as the steady opponents of the present Liberal administration, unless the really Radical mem-

bers of that administration, who have over and over again proved their fidelity to the cause of Ireland, should be able to prevail on those whom I may call for the moment by an old-fashioned phrase, the Whig members of the Ministry, to yield to the demands of justice and of Ireland. We know there are members of the present Cabinet who still remain absolutely faithful to the policy and the promises of their great leader, William Ewart Gladstone, and if these should prevail—and we know that Mr. Asquith is not the man to risk his position for the sake of some mere personal predilection—it is still possible that an understanding may be come to with the Irish National party. But if the influences against the early introduction of a Home Rule measure should overrule the present Cabinet, we can look for nothing but a policy of general opposition from Mr. Redmond and his band of patriotic Irish followers. I have heard opponents of Ireland's national demand for Home Rule argue quite seriously that the English Government, whether it be Liberal or Conservative, need not trouble itself much now about the influence of Ireland and her parliamentary representatives in English statesmanship. The reason which these men give is that the population of Ireland is steadily diminishing year after year, and that it must soon become a matter of no importance to English political parties whether Ireland is or is not loyal or hostile to British rule. But I feel quite satisfied that arguments such as these will never have any influence with the great majority of the English people, and that these will never be led to close their ears against Ireland's rightful claim because of the assurance that Ireland must soon cease, by the mere decay of her population, to be a force of any influence in the movements of British administration. The best influences of Englishmen will be governed by higher principles than such ignoble and utterly unworthy calculations.

The death of my dear old friend, George Meredith, has created, I feel quite sure, as sincere and profound regret among readers in the United States as it has done among readers in England's dominions. Many years have past since I first was admitted to the friendship of the great poet, novelist and thinker, and I used to visit him often at his delightful home at Box Hill, in Surrey. Of late, however, his health had become so completely broken that he could hardly ever receive visitors, and the news of his death came upon us at last without any shock of surprise, altho with as much of pain and grief as if it had been quite unexpected. The whole press and public of these countries were unanimous in their estimation of Meredith's genius, and the critics seemed to be equally unanimous in their resolve to assign to him the highest literary position among the novelists and poets and thinkers of Queen Victoria's reign. I could not help remembering, however, that only within very recent years had English criticism paid such tribute of appreciation, or anything at all like it, to the genius of Meredith.

I was myself ever a devoted admirer of Meredith since I first came to hold a working place among literary men in London, and I must always bear in mind what trouble I had to obtain a place in one of the London quarterly reviews for an article of mine on the then not by any means popular or even recognized author of "The Ordeal of Richard Feverel" and "Evan Harrington." The editor of one review, to which I had already been more than once a contributor, expressed a willingness to accept my article if only I would include some other authors in it and not make it merely an essay on the works of George Meredith. I did, however, succeed in having the article published, but for many years after the date of its publication Meredith continued to be the admired of only a very limited circle of disciples, who were supposed to have made for him a special cult of their own merely because they had become possessed with the gratifying conviction that they and they alone had discovered a new star in the literary firmament.

For many, many years George Merc-

dith continued to be utterly unrecognized by the great majority of the public, and indeed, I may add, by the great majority of the professional literary critics. Now that he is dead, we are told by all these critics that Meredith stood at the forefront of the poets, novelists and moral philosophers of his time, and that only the most perverse or ignorant outsider could dispute his title to that proud precedence. I can easily imagine how much it would have amused George Meredith himself if he could only, by some miraculous foresight, have been enabled to read the rapturous eulogies passed upon him by critics who only discovered his rightful place in Fame's proud temple after they had become aware of his death. Meredith himself had often spoken freely to his friends in former years about the manner in which criticism in general dealt with him in quarterly reviews and magazines and journals at the time, and had never shown the slightest indication that he felt any serious resentment to those who reviewed him disparagingly or who never reviewed him at all, but only treated the whole subject with his characteristic humor. It must have been a great trouble to him during the later years, that he had to give up so many of the athletic exercises in which he had always taken so keen a delight. He loved to ride and to drive, he made it a daily duty and found it a daily delight to take what he used to call "a brisk spin"; in other words, a rapid, rushing walk through woods and by river banks, and he much enjoyed strenuous exercise with heavy clubs and the practice of throwing one such club high into the air and catching it by the handle before it fell to the ground. In the enjoyment of such pursuits he did not find himself much put out by the fact that the popular critics did not generally seem to remember him when preparing their literary reviews.

A deep dissatisfaction has been created thruout these islands, and must long before this have found its expanded echo thruout the United States by the refusal of the Dean of Westminster to allow the ashes of George Meredith a place of sepulture in Westminster Abbey. According to Meredith's own latest directions,

his corpse had been put thru the process of cremation, and the desire of his relatives and friends was that the vessel containing his ashes should find a place in that venerable abbey where so many of England's great authors lie entombed. But the Dean and Chapter appear to have given a decided refusal to all such requests, and the ashes of the great author are assigned to sepulture in a rural church-yard near to the home of his recent years. It seems to me hard to understand even the motive of this exclusion from the abbey which contains the mortal remains of so many men of genius. George Meredith did not profess to be an atheist, or even a disbeliever in the tenets of Christianity, or what is commonly described as an agnostic, and he seemed to me, as I think his writings must show to all others, that he was always animated by what must be described as a genuine religious spirit. I hope that some effort may be made to bring this painful question under the notice of the House of Commons if only with the object of making it known to the world that the decision of the Dean of Westminster does not represent the feeling of the public in general thruout these islands, in the firmament of whose literature he must ever shine as a star.

My countrymen and women in the United States, and indeed many others in those States as well as they, must have been deeply touched by the recent announcement of the death of Miss Charlotte Grace O'Brien, daughter of William Smith O'Brien, who was many years ago a leading figure in the political life of Ireland. The name of Smith O'Brien carries our memories back to a thrilling period in the history of Ireland's national struggles. He belonged to a high aristocratic family, and was brought up as a Conservative, but in his early manhood he became converted to the principles of the Irish National party, and his was a leading figure in the insurrection of 1848. I was present, then a mere youth, at his trial in Clonmel for high treason, when he was found guilty along with Thomas Francis Meagher, another prisoner, and sentenced to death. The sentence was commuted later by Queen Victoria into the penalty of transportation for life, and after he had lived for some years in enforced

exile he received, by the authority of the Queen, permission to return to this country, a permission of which he availed himself. His comrade in the trial for high treason, Thomas Francis Meagher, was also transported to a penal colony, but contrived to effect his escape and went to the United States, where, during the great Civil War, he devoted himself to the cause of the Northern States, entered into the military service of the North, organized the Irish Brigade and won high reputation in some of the great battles. I may add that the distinguished author and member of Parliament, my friend, Mr. Stephen Gwynn, one of the most gifted members of the Irish National party, is a nephew of Smith O'Brien. The *Cork Examiner* tells us that Miss O'Brien "will be best remembered now for her splendid exertion on behalf of Irish girls emigrating to the United States," and that she displayed "a spirit of sacrifice and a sense of chivalry and charity not a whit less meritorious than that which distinguished Miss Florence Nightingale."

I was deeply grieved to hear, and I am sure that many others in these countries will be as deeply grieved to hear, the announcement just brought across the Atlantic that Edward Everett Hale has closed his long and noble earthly career. I had the honor and the happiness of knowing the Rev. Dr. Edward Everett Hale, to give him his full designation, during one of my visits to the United States, and the acquaintanceship was renewed in my latest visit. He had led a noble life in the best sense of the words. As a minister of a Christian church, as a philanthropist, and an active and untiring associate in every great public and private organization in the cause of humanity at home and abroad, he became conspicuous without any desire to be conspicuous among his fellow countrymen, and was known thruout the civilized world. He was a man of charming manners, a delightful companion, and had a mind well stored with treasures gathered from the realms of literature and art. I am never likely to forget the last walk I had with him in Boston during my latest visit to the United States, and the delightful conversation with which he entertained my daughter and me.

The Sailor's "Chanties"

BY JAMES H. WILLIAMS

[The following are some very considerably improved versions of "Nautical Songs" which in some cases appear to come nearer the unknown original. Mr. Williams is the sailor friend who has written for us notable sea stories. (L. P. M.)]

THE following are some typical chanties and sea songs taken at random from the repertoire of that almost extinct functionary, the chanty man.

All chanties and sea songs in general are very old and their authorship is in every case unknown. The bards of the forecastle have passed away, leaving behind them their wayward songs to lighten the labor and gladden the hours of hundreds of thousands of their successors.

It is a peculiar fact that chanties were never sung in any but American and British ships. But every chanty has its meaning. Many of them commemorate historical events, such as "Bony was a Warrior," the meaning of which is unmistakable.

"Santa Ana" and "The Plains of Mexico" commemorate the war with Mexico in the same way.

"California Gold," "South Australia" and the "Banks of Sacramento" remind us of the gold-fever days and need no explanation.

Some chanties relate to certain commercial epochs, such as "Roll the Cotton Down," "Mobile Bay," "Tommy's Gone and I'll Go, Too." All these originated in the old Cotton Jammers, which were so famous just before the Civil War.

Some chanties are sentimental, or romantic, like "Rueben Rauzo," "Sally Brown" and "Leave Her, Johnny, Leave Her."

Of course, there are nonsense chanties, just as there are nonsense poems, many of which were written by gifted authors just to furnish amusement.

But in the limited space accorded me here I can only mention the titles of some of these famous old heaving and hoisting songs which I hope some day to see published entire in book form and preserved for all time.

Any man who had stood with me on the shores of a South American harbor in the early dawn and heard the strains

of "Rio Grande" come rolling across the placid bay while a ship's crew were heaving their anchor would have to confess that it was about the most inspiring vocal music he had ever heard.

"In Rio Grande, I'll take my stand,
Heave away, to Rio,
Oh, Rio Grande, a happy fair land,
' We're bound to Rio Grande.
Heave away, to Rio;
Heave away, oh, Rio;
So fare you well, my bonny brown maid,
We're bound to Rio Grande."

These chanties are not always in perfect measure, because they were made by rough, untutored men who had no conception of literary finesse. But they are always near enough so as to enable us to keep perfect time in hauling or heaving.

Another thing is that, while many of these songs have stood the test of a century, or perhaps two, and have passed from lip to lip thousands of times over the airs to which they are sung, they have never changed.

Still another somewhat remarkable fact is that thruout the whole list of known chanties there does not occur a single offensive word, and whenever any indecent language has been injected into one of our favorite chanties, it is at once expurgated by common consent.

In presenting the following brief record of chanties I have adhered as strictly as possible to the original text, and in this I have reason to believe that I am as near right as any man can be.

I claim no authorship for these ancient sea songs.

I have only arranged them as we sang them, so they may be read, and I hope they will be appreciated.

The glory of the sea has departed and chanties are sung no more. The steam winch rumbles in the singer's place. The lusty chorus round the capstan bars is hushed forever. Never again will the fashionable ladies of the viceregal set drive down to the Esplanade, in their stately carriages, where the big clipper

ships lay four and four abreast in solid phalanx, from Warren Hastings to Howrah Bridge, and listen and applaud rapturously while the laboring seamen sing with ringing voices at their evening tasks, and the military band in Mindum Park blare thru their brazen trumpets to empty benches.

Should you ask me whence these chanties,
These old sea-songs and come-all-ye's;
With the clattering of the clutch-pawls
As we labored at the windlass,
Hove around the trundling barrel.
Raised our topsails to the mast-head,
Trimmed our sheets and squared our braces,
To the solitary southward.
When we "fished" our steadfast anchor,
Lashed it down unto the cat-head,
Brailed our bowlines taut a-weather
As we worked our ship to southward
Thru the Trades so clear and glorious.
When we past the Southern Georges
Down beyond the dismal Falklands,
Cleared the shores of Staten Island,
Where the blubber seals were roaring
Beat our way to drear Antarctic,
Where Cape Horn was left behind us.
When we past the Rock Ascension,
And the spur of Saint Helena,
Where Napoleon died in exile,
To appease the strife of Europe;
And the military pathway
Leads up to the barren summit,
When we rounded Cape Agulhas,
Squared away and run our easting
Past the Isle Tristan da Cunha,
And the shores of Desolation.

Should you ask me all these questions
I should answer you in this wise:
From those clippers, tall and stately,
Rushing thru the Roaring Forties;
From the sturdy blubber-hunters
And the wide-winged Cotton-jammers.

All the sea-fowl sang them to me,
Mollyhawks and albatrosses,
Penguins with their stare so curious,
And the fluttering, stormy petrels.
By the stern cliffs of Magellan
Down among the frigid ice floes,
Where Saint Elmo's lights were glowing
Round our straining, tautened yard ends,
As we doubled that bleak corner
Where the Sou' West winds were howling
And the hail was ever falling
And the mighty seas were rushing
'Gainst the cliffs forever frowning
Toward the dread Antarctic Ocean,
Past Cape Horn, so bleak and dreary,
There I learned these wond'rous sea-songs
From the lips of Garry Owen,
As we struggled at the halyards,
As we sheeted home our topsails—
With his shipmate, "Splitnose" Sweeney.
I will sing them as I caught them
With the Southern Cross to Northward,
Where the polar ice was crunching
And the North Star hung to Southward.

I will give them as I got them;
Songs so wild and full of frolic,
Not a word nor score of sadness
Not a verse of melancholy;
Ye who love a nation's his'try
Love her folk-songs and traditions,
Listen to these simple chanties,
To these songs of Garry Owen.

JAS. H. WILLIAMS.

HOMeward BOUND.

(Windlass Chanty or Heaving Song.)

Oh, fare you well, we're homeward bound,
Good bye, fare you well! oh, good bye, fare you well!
We'll heave away till our anchor's found,
Hurrah! hurrah! we're homeward bound!

So, fare you well, my rosy Nell,
Good bye, fare you well! oh, good bye, fare you well!
Oh, fare you well, for I wish you well,
Hurrah, hurrah! we're homeward bound.

I think I heard our old man say,
Good bye, fare you well! oh, good bye, fare you well!
"This is the day we sail away,"
Hurrah, my boys, we're homeward bound!

We're homeward bound, from Hong Kong town,
Good bye, fare you well! oh, good bye, fare you well!
We're homeward bound, heave up and down,
Hurrah, my boys, sing fare you well!

We're homeward bound, across the sea,
Good bye, fare you well! oh, good bye, fare you well!
We're homeward bound with a cargo of tea,
Hurrah, hurrah! we're homeward bound!

We're homeward bound and the winds they blow fair,
Good bye, fare you well! oh, good bye, fare you well!
And there'll be many true friends to greet us there
Hurrah, my boys, sing fare you well!
(Vast heaving! Anchor's aweigh, Sir!)

"BLOW THE MAN DOWN."

(A Topsail Halyard Chanty.)

Solo—Come all you young fellows who follow the sea,
Chorus—To me weigh, heigh, blow the man down!
Solo—Now please pay attention and listen to me:
Chorus—Give me some time to blow the man down!

Solo—I'm a deep water sailor, just come from Hong Kong,

Chorus—*To me weigh, heigh, blow the man down!*

Solo—If you give me some whisky I'll sing you a song;

Chorus—*Give me some time to blow the man down!*

Solo—On a trim Black Ball Liner, I first served my time,

Chorus—*To me weigh, heigh, blow the man down!*

Solo—On a trim Black Ball Liner, I wasted my prime,

Chorus—*Give me some time to blow the man down!*

Solo—When a big Black Ball Liner's preparing for sea,

Chorus—*To me weigh, heigh, blow the man down!*

Solo—You'd split your sides laughing, such sights you would see,

Chorus—*Give me some time to blow the man down!*

Solo—Here's a big Black Ball Clipper, just leaving her dock,

Chorus—*To me weigh, heigh, blow the man down!*

Solo—While the boys and the girls on the pier head do flock;

Chorus—*Give me some time to blow the man down!*

Solo—There are tinkers and tailors, shoe-makers and all,

Chorus—*To me weigh, heigh, blow the man down!*

Solo—For you'll seldom find sailors, aboard the Black Ball;

Chorus—*Give me some time to blow the man down!*

Solo—Now when a Black Baller gets clear of the land,

Chorus—*To me weigh, heigh, blow the man down!*

Solo—Our Bos'un soon roars out the word of command;

Chorus—*Give me some time to blow the man down!*

Solo—"Come quickly lay aft, to the break of the poop!

Chorus—*To me weigh, heigh, blow the man down,*

Solo—Or I'll help you along with the toe of my boot!

Chorus—*Give me some time to blow the man down!*

Solo—"Pay attention to orders, now you one and all!

Chorus—*To me weigh, heigh, blow the man down!*

Solo—For see; right above you there flies the Black Ball!

Chorus—*Give me some time to blow the man down!*

Solo—"To the larboard and starboard, on deck you will sprawl!

Chorus—*To me weigh, heigh, blow the man down!*

Solo—"For kicking Jack Rogers commands the Black Ball,"

Chorus—*Give me some time to blow the man down!*

(Belay.)

REUBEN RAUZO.

(*Hoisting Song.*)

Oh, Rauzo was no sailor;
Rauzo, boys, Rauzo!
 He shipped in a Yankee whaler
Rauzo, boys, Rauzo!

But he could not do his duty
Rauzo, boys, Rauzo!
 But he could not do his duty,
Rauzo, boys, Rauzo!

Now the mate he being a hard man,
Rauzo, boys, Rauzo!
 He took him to the gangway,
Rauzo, boys, Rauzo!

He took him to the gangway,
Rauzo, boys, Rauzo!
 And he gave him five and forty,
Rauzo, boys, Rauzo!

Poor old Reuben Rauzo!
Rauzo, boys, Rauzo!
 Oh, poor old Reuben Rauzo!
Rauzo, boys, Rauzo!

But the captain being a good man,
Rauzo, boys, Rauzo!
 He took him to the cabin,
Rauzo, boys, Rauzo!

He took him to the cabin,
Rauzo, boys, Rauzo!
 And gave him wine and brandy,
Rauzo, boys, Rauzo!

And he taught him navigation,
Rauzo, boys, Rauzo!
 And raised him in his station,
Rauzo, boys, Rauzo!

And he married the captain's daughter,
Rauzo, boys, Rauzo!
 And still he sails blue water,
Rauzo, boys, Rauzo!

And now he's Captain Rauzo,
Rauzo, boys, Rauzo!
 And now he's Captain Rauzo,
Rauzo, boys, Rauzo!

Hurrah for Captain Rauzo,
Rauzo, boys, Rauzo!
 Hurrah for Captain Rauzo,
Rauzo, boys, Rauzo!

(High! Make fast!)

WHISKY.

(Mizzen Topsail Halyards.)

Oh whisky is the life of man!

Whisky! Johnny!

It always was since time began;

Oh, whisky for the Johnny!

Oh, whisky straight and whisky strong;

Whisky! Johnny!

Give me some whisky and I'll sing you a song;

Oh, whisky for the Johnny!

Oh, whisky made me wear old clo's,

Whisky! Johnny!

Oh, whisky gave me a broken nose,

Oh, whisky for the Johnny!

If whisky comes too near my nose;

Whisky! Johnny!

I tip her up and down she goes!

Oh, whisky for the Johnny!

I think I heard our Old Man say,

Whisky! Johnny!

"I'll treat my men in a decent way."

Oh, whisky for the Johnny!

"I'll treat my men in a decent way!"

Whisky! Johnny!

"I'll grog them all three times a day!"

Oh, whisky for the Johnny!

Here comes the cook, with the whisky can!

Whisky! Johnny!

And a glass o' grog for every man;

Oh, whisky for the Johnny!

A glass of grog for every man!

Whisky! Johnny!

And a bottle full, for the chantie man;

Oh, whisky for the Johnny!

(Belay; Grog-o!)

A YANKEE SHIP CAME DOWN THE RIVER.

(Halyard Chanty.)

Oh, a Yankee ship came down the river;

Blow; boys, blow!

He luffs her up 'till her topsails quiver;

Blow! my bully boys, BLOW!

This Yankee ship, she's bound to China,

Blow! boys, BLOW!

Hurrah, my boys, it's time to join her;

Blow! my bully boys, BLOW!

"Now how d'ye know she's a Yankee packet?"

Blow! boys, BLOW!

"They fired a gun, I heard the racket."

Blow! my bully boys, BLOW!

"Now how d'ye know she's bound to China."

Blow! boys, BLOW!

"The Stars and Stripes float out behind her."

Blow! my bully boys, BLOW!

Now who d'ye think was the captain of her?

Blow! boys, BLOW!

Oh, Jimmy Long Jackson, a South Sea Rover!

Blow! my bully boys, BLOW!

Oh, Jimmy Long Jackson's a Yankee sailor!

Blow! boys, BLOW!

Oh, Jimmy Long Jackson's a South Sea whaler;

Blow! my bully boys, BLOW!

Now who d'ye think was the chief mate of her?

Blow! boys, BLOW!

A big mulatter belongs to Antigua,

Blow! my bully boys, BLOW!

And who d'ye think was the bos'un of her?

Blow! boys, BLOW!

Ole Olsen from Stockholm, Sweden;

Blow! my bully boys, BLOW!

And who d'ye think was steward of her?

Blow! boys, BLOW!

Chim-Cham, Chinaman, from Hong Kong, China!

Blow! my bully boys, BLOW!

Oh, what d'ye think we had for dinner?

Blow! boys, BLOW!

Oh, bad fish hash and a slice of liver!

Blow! my bully boys, BLOW!

Oh, blow today, we'll blow tomorrow!

Blow! boys, BLOW!

We'll blow away all care and sorrow;

Blow! my bully boys, BLOW!

(Belay.)

*"A LONG TIME AGO."**(Halyard Chanty.)*

Away down South, where I was born!

To me weigh, heigh, heigh Yah!

Among the fields of cane and corn;

A long time ago!

I wish to God I had never been born,

To me weigh, heigh, heigh Yah!

To go rambling round and round Cape Horn;

A long time ago!

Around Cape Horn, where wild winds blow,

To me weigh, heigh, heigh Yah!

Around Cape Horn, thru frost and snow;

A long time ago!

The wind from the south-west blowing a gale,

To me weigh, heigh, heigh Yah!

The packet ship she's crowding sail,

A long time ago!

The monkey dressed in the soldier's clo's,

To me weigh, heigh, heigh Yah!

But where he came from, God only knows,

A long time ago!

Oh, "Bully John" from Baltimore,
To me weigh, heigh, heigh Yah!
 I knew you well on the Eastern Shore,
A long time ago!

Oh, "Bully John" was the best for me,
To me weigh, heigh, heigh Yah!
 A bucko on land and a bully at sea,
A long time ago!

Oh "Bully John," I knew him well,
To me weigh, heigh, heigh Yah!
 But now he's dead and gone to hell,
A long time ago!

'Tis a long time and a very long time,
To me weigh, heigh, heigh Yah!
 'Tis a very long time since I made this rime,
A long time ago!

(Belay!)

HAUL AWAY THE BOWLINE.

Oh, haul away the bo'lin', the packet ship's
 arollin',
 Away, haul away, haul away, JOE! (Pull on,
 "Joe").

Oh, haul away the bo'lin', don't ye hear the
 captain growlin',
 Away, haul away, haul away, JOE!

Oh, haul away together, we're sure to make
 her render,

Away, haul away, haul away, JOE!
 Oh, haul away, my bully boys, we'll either
 break or bend her,
 Away, haul away, haul away, JOE!

Oh, the cook is in the galley, a-makin' duff so
 handy,

Away, haul away, haul away, JOE!
 And the captain's in the cabin, a-drinkin' wine
 and brandy,
 Away, haul away, haul away, JOE!

Oh, once I had an Irish girl, and she was fat
 and lazy,

Away, haul away, haul away, JOE!
 And now I got a Yankee girl, she nearly set
 me crazy,
 Away, haul away, haul away, JOE!

Haul away the bo'lin', me hearty lads be
 handy,

Away, haul away, haul away, JOE!
 Haul away the bo'lin', Yankee Doodle Dandy
 Away, haul away, haul away, JOE!
 (Turn-o!)

BONY WAS A WARRIOR.

(British Halvard Chanty.)

Oh, Bony was a warrior,
To me weigh, heigh, ho!
 But we hiled him at Trafalgar once,
Jawn France-o!

He raised a mighty army there
To me weigh, heigh, ho!
 And marched them right across the Alps,
Jawn France-o!

He marched them into the Russian Wild,
To me weigh, heigh, ho!
 But he found the Kremlin burning there,
Jawn France-o!

So then he marched them back again,
To me weigh, heigh, ho!
 For Moscow was an ash heap, then,
Jawn France-o!

'Twas on the plains of Waterloo,
To me weigh, heigh, ho!
 He met the boy who put him thru,
Jawn France-o!

The Iron Duke of Wellington,
To me weigh, heigh, ho!
 That day almighty deeds were done,
Jawn France-o!

Oh, Bony was a sad exile,
To me weigh, heigh, ho!
 He died on Sant Helena's Isle,
Jawn France-o!

But Bony was a warrior,
To me weigh, heigh, ho!
 Tho we licked him at Trafalgar once,
Jawn France-o!

(Belay!)

WHAT SHALL WE DO WITH A DRUNKEN SAILOR?

(A Main Brace "Walk Away" Chanty.)

What shall we do with a drunken sailor?
 What shall we do with a drunken sailor?
 What shall we do with a drunken sailor?
 Early in the morning!

Put him in the long-boat 'till he is sober.
 Put him in the long-boat 'till he is sober.
 Put him in the long-boat 'till he is sober.
 Early in the morning!

(Stopper and Belay!)

FIRE DOWN BELOW!

(A Pumping Song.)

There's fire in the lower hold, fire down
 below?

To me weigh, heigh, heigh, ho!
 Fire in the main hold, the cap'n didn't know
Slaw, fire, slaw, heigh!

There is fire in the fore top; fire in the main;
To me weigh, heigh, heigh, ho!
 Fire in the main hold, and fire in the main;
Slaw, fire, slaw, heigh!

There's fire in the fore peak, fire down below;
To me weigh, heigh, heigh, heigh, ho!
 There's fire in the main hold, the cap'n didn't know,
Slaw, fire, slaw, heigh!

There's fire up aloft, there's fire down below;
To me weigh, heigh, heigh, heigh, ho!
 There's fire in the galley; the cook he didn't
 know;
Sing, fire—down—below!

There's fire in the whole ship, the mate he
 being drunk,
To me weigh, heigh, heigh, heigh, ho!
 The cap'n went below and found him in his
 bunk,
Sing, fire—down—below!
(Suck-o! unship the brakes.)

A WHALING SONG.

Come all you young sailors who cruise 'round
 Cape Horn.
 Come all you young tars that go hunting for
 sperm,
 For our captain has told us, we hope it is
 true,
 There are plenty of whales on the coast of
 Peru,
 So we'll roll, roll, bullies, roll as we go,
 For the Liverpool lassies have got us in tow.
 I dey, O, sing Laddie, O, Laddie, I dey,

Now we are a-sailing on the coast of Peru,
 As all good young whalemén are priv'leged to
 do.
 Our ship she is steady, her quarters are
 manned,
 And her rigging is ready, composed of four
 strands.
 So we'll roll, roll, bullies, roll as we go,
 For the Liverpool lassies have got us in tow.

'Twas early one morning, just as the sun rose,
 A man from the masthead sung out: "There
 she blows!"
 "Where away," cries our captain, "and how
 does he lay."
 "Two points on our lee, sir, scarce three miles
 away."
 So we'll roll, roll, bullies, roll as we go,
 For the Liverpool lassies have got us in tow.

Then get my boats ready and make my boats
 fly,
 But one thing we dread of, keep clear of his
 eye,
 But one thing we dread of, keep clear of his
 eye,
 For well you all know that a whale is quite
 shy,
 So we'll roll, roll, bullies, roll as we go,
 For the Liverpool lassies have got us in tow.

Now the whale has gone down, to the wind
 ward he'll lay,
 Whatever he done, "boys," he showed us fair
 play,
 But we fought him alongside, and a lance we
 thrust in,
 And in less than ten minutes he rolled out his
 fin,
 So it's roll, roll, bullies, roll as we go,
 For the Liverpool lassies have got us in tow.

We laid him alongside with many a loud
 shout,
 Began cutting in, and then trying out.
 The whale is cut in, tryed out and stowed
 down,
 He is better to us than five hundred pound,
 So we'll roll, roll, bullies, roll as we go,
 For the Liverpool lassies have got us in tow.

Now our ship she is laden, for home we will
 steer,
 Where there's plenty of grog, boys, and plenty
 strong beers.
 We'll spend money freely, with the girls on
 the shore,
 And when it's all gone we'll go whaling for
 more,
 So we'll roll, roll, bullies, roll as we go,
 For the Liverpool lassies have got us in tow.
 I dey, O, sing Laddie, O, Laddie, I dey.

THE CRUISE OF THE "DREADNAUGHT."

She's a saucy fast packet, and a packet of
 fame;
 She hails from New York, and the "Dread-
 naught's" her name.
 She's bound to the westward, where strong
 winds do blow,
 She's a Liverpool Liner, bully boys let her go!

Chorus.

Bound away, bound away, where strong winds
 do blow!
 Bound away in the "Dreadnaught," to the
 westward we'll go!

Now the "Dreadnaught" is leaving the Water-
 loo Dock,
 Where the boys and the girls on the pier-head
 do flock,
 They give her three cheers, while their tears
 freely flow.
 Bound away in the "Dreadnaught," to the
 westward we'll go!

Now the "Dreadnaught" is anchored in the
 Mersey, so free,
 Waiting for the "Independence" to tow her to
 sea.
 Down past those black rocks, where the Mer-
 sey does flow,
 Bound away in the "Dreadnaught," to the
 westward we'll go!

Now the "Dreadnaught" is sailing down the
 wild Irish sea,
 Her passengers on deck, all their hearts light
 and free,
 And the seamen on watch, pace the decks too
 and fro;
 Bound away in the "Dreadnaught," to the
 westward we'll go!

Now the "Dreadnaught" is plowing the At-
 lantic so wide,
 Where the heavy green seas roll along her
 black side,

Her sails trimmed so neatly, her red cross to show,
Bound away in the "Dreadnaught" to the westward we'll go!

Now the "Dreadnaught" is crossing "The Georges" so grand,
Where the sea it is green and the bottom is sand,
Where the big fish swim 'round her and coy-ing whales blow;
Bound away in the "Dreadnaught," to the westward we'll go!

Now the "Dreadnaught" has arrived in America once more,
Let's go ashore, shipmates, on the land we adore,
See our wives and our sweethearts, be jolly and free,
And we'll drink to the "Dreadnaught," wherever she be!

Here's health to the "Dreadnaught" and to her bold crew,
Here's health to her captain and officers true,
Talk about your fast packets, "Swallowtail" and "Blackball,"
But the "Dreadnaught's" the clipper to out-sail them all!

Bound away, bound away, where strong winds do blow!
Bound away in the "Dreadnaught," to the westward we'll go!

(The writer's compliments to the venerable Captain Samuel W. Samuels, who sailed the "Dreadnaught" across the Atlantic in nine days, a performance which has never been equalled by any other sailing vessel.)

PAUL JONES.

The old Scotch Southern, who flew the Stripes and Stars,
The whistling wind from west nor-west blew thru our pitch-pine spars;
We had our bonnet-birds and our bonnet as we hung upon a gale,
And George's Diamond light shone brightly from the Old Head of Kinsale.

No thought was there of short'ning sail by him who trod our poop,
Altho' the press of our provisions, like the boom bends like a hoop.
Our groaning chess-trees told the strain, that stood on our stout main tack,
But he only smiled, as he glanced down at the white and sparkling track.

It was a bright and a cloudless night, the wind blew fresh and strong,
As gaily on the Channel wave our good ship sped along.
With our framing sea before her, how the biny wave she spread,
And heading low in a foam the sea her lee cat-head.

"What's this upon our weather bow, what ship is it I see?"

It's time our good ship hauled her wind, we're abreast of Old Saltee!"

'Twas by the nightly robe she wore, and her tapering length of spar,
We knew our morning visitor was a British man of war.

What did our daring foeman do? A shot ahead he passed,
Clew up his flowing courses, laid his top-sails to the mast,
Those British tars gave three huzzas from the deck of their black corvette,
We answered back with a scornful laugh as our starry flag we set.

"Out booms, out booms!" cried the Southerner; "out booms and give her sheet!
Here comes the fastest vessel of all the Channel fleet.

She's bearing down upon us, with white foam at her bow,
"Out booms, out booms!" cried the Southerner; "don't spare your canvas now!"

Up spake our noble captain then, not a cloud was on his brow,
Saying, "Come, my gallant heroes bold, the enemy's on us now.

We carry aloft the Stars and Stripes against old England's boast,

Paul Jones, the terror of the sea, will whip them on their coast!"

The fog lay heavy on the coast, and the wind was from the shore,

And the poor Dungarren fishermen sought shelter in Kinsore.

With light sails set and booms rigged out and stun'sails hoisted away.

Paul Jones did clear the Channel mouth before the break of day.

THE "CUMBERLAND'S" CREW.

Come, shipmates, gather 'round me and hark to my ditty,

Of a terrible battle that happened of late;
Let each good Union tar shed a sad tear of pity,

When he thinks of the once gallant "Cumberland's" fate.

Oh, yes, my brave lads, 'tis a terrible story,
And many a brave man in this world has sold

Our flag it was wrapped in a mantle of glory,
On the stormy seas of the "Cumberland's" crew.

'Twas the eighth day of March, about ten in the morning,

The day it was that our countrymen the

When the drum of the "Cumberland" rime

When our brave men were standing by his gun.

For the bold iron frigate down on us came bearing,

And high in the air the rebel flag flew,
The ensign of treason at her masthead was flaring

To strike terror to the hearts of the "Cumberland's crew.

Then out spake our captain, with stern resolution,

"Of this bold iron monster do not be dismayed.

We are bound to maintain our beloved Constitution.

To die for our country we are not afraid.

"We'll fight for the Union, our cause it is glorious;

For the Star Spangled Banner, the red, white and blue,

We'll die at our quarters, or conquer victorious!"

'Twas answered with cheers by the "Cumberland's crew.

Then the bold iron ram bore down at close quarters,

Her sharp iron prow pierced our noble ship thru,

But, as she sunk 'neath the dark rolling waters,

"We'll stand by our guns!" cried the "Cumberland's" crew.

From the foregoing I must not omit the venerable "Salt Horse" chanty. Where it originated no man knows, tho, personally, I believe it to be of Welsh extraction. It was always recited, not sung, over the mess kit by one member of the crew when we were about to dissect the piece of salt junk which, in the olden days, invariably constituted the piece de resistance to our midday meal.

Mr. Dana repeats the words in his famous work, "Two Years Before the Mast," tho not so fully as I do here.

SALT HORSE CHANTY.

Old horse, old horse, how came you here?
"From Barry Docks to Portland Pier,
I carted stones for many a year.
I labored long and well, alack,
'Till I fell down and broke my back.
They picked me up, with sore abuse,
And salted me down for sailors' use
They eat my flesh and gnaw my bones,
And throw the rest to Davy Jones."

The New Campaign Expense Law in Colorado

BY JOHN F. SHAFROTH

GOVERNOR OF COLORADO.

ON the 26th day of July, 1909, in the State of Colorado, there will come into effect a law passed by the last General Assembly, which provides that campaign expenses can only be paid by the State and the candidates for the various State and county offices. The amount payable out of the State Treasury is a sum equal to 25 cents for each vote cast at the last preceding general election for Governor. The sum for each political party is paid to the State Chairman thereof, who transmits one-half of the same to the chairman of the county organization of his party. The State Chairman is required to give a bond, for the expenditure of the funds for legitimate campaign purposes. The amount to be collected from the candidates is limited to not exceeding 40 per cent of the first year's sal-

ary of the office to which each candidate aspires.

It is made a felony for any person or corporation other than above indicated to contribute any money or property whatsoever to a candidate or political committee or member thereof, and also for any candidate or political committee or member thereof to receive any contribution. Colorado is the first State in the Union to enact such a law, and I have the highest hopes of success for this reform measure.

One of the most pronounced evils under the present system of elections has been the undue influence created by corporations financing the campaigns of political parties. Large contributions from such sources have placed the organizations and candidates of political

parties under the greatest obligation to such corporate interests. The result has been that the interests of such companies have been too frequently protected by those elected to enact and execute the laws of the States. Such contributions are often, in moral effect, indirect bribes.

To overcome this corrupt influence, laws have been enacted prohibiting corporations from making contributions for campaign purposes. But the inefficiency of such law arises from the fact that stockholders of such corporations are not prohibited from making such donations and hence the object of the law can be easily evaded.

It has been contended that publicity of contributions to campaign funds, before elections, would remedy the evil. While no doubt such publicity would have a retarding effect on donations made for political favors, yet unless the act of contributing is prohibited, there will always be a class of people who are willing to brave criticism in order to obtain the desired favors. So also campaign committees, in order to meet the demands of the political machines of their parties, are generally willing to run the risk of censure for receiving such contributions.

In my judgment, there is no way of preventing the pernicious influence of corporations in politics except by pronouncing such contributions bribery, and punishing the giver and receiver of such contributions by fine or imprisonment in the penitentiary. That is what the new law in Colorado does, and its effect on future elections in my judgment must be for good. Many corporations that do not desire to improperly influence legislation or the due administration of the law often, when solicited, contribute to campaign funds. They do so because they feel they dare not refuse—that they might become the subjects of persecution. Such corporations should hail with pleasure the passage of this measure.

Another beneficial result of such a law will be the compelling by the necessity of the situation of an economical campaign. The fund to be furnished by

the State of Colorado for the next general election will be about \$65,000, to be divided among the political parties according to the votes cast by each for its candidate for Governor at the last preceding general election. That sum, together with the assessments authorized to be made upon candidates, will be sufficient to conduct a campaign in a reasonably economical manner.

There will be no money to hire thousands of men during the week preceding the election, to work in behalf of any political party. It has been the custom in many cities for years to employ large numbers of men who are doubtful in their political allegiance, or who belong to the opposite party, to work at the price of five dollars a day for several days preceding election. Such employment almost invariably results in the employee voting the ticket for which he is hired to work, and consequently is an indirect way of bribing many of the voters. The funds, limited by this law, will be too meager to permit of such extravagance. It is needless to say that with such a limited campaign fund the direct bribery of voters by campaign workers will be largely avoided. A limited campaign fund prevents the use of any part thereof for other than legitimate purposes.

Another wholesome effect of the law in my judgment will be the placing of the political parties in a campaign on as near an equal basis as possible, considering the numerical strength of each. The excuse under the present system of raising large campaign funds is the continued and persistent representation that the other side has an enormous sum for political purposes and unless a corresponding amount is contributed it will mean defeat. Often the representations are untrue, but when both parties use the same argument, it swells the campaign fund of each party beyond the legitimate needs of a campaign committee and the surplus is often used for corrupt purposes.

I am confident that this measure will greatly tend to the purity of elections.

EDWARD C. C.

A Needed Reform in Science Teaching

BY C. R. MANN, Ph.D.

PROFESSOR OF PHYSICS IN THE UNIVERSITY OF CHICAGO.

AT the meeting of the American Association for the Advancement of Science, which was held at Columbia University a year ago, President Butler, in welcoming the association to the university over which he presides, made the following statement:

"I am one of those who now for nearly thirty years have observed at first hand the slow, and then the rapid, advance of the sciences to their present place in the school and college programs of the country. . . . But now, at the end of this period, I cannot help feeling—and I observe from reading the literature of the subject that the same feeling is shown in England, in France, and in Germany—that we have not yet succeeded in so organizing the sciences as instruments of general education as to fulfill the high expectations which some of us formed for them nearly a quarter of a century ago. . . . There can be little doubt that the sciences of nature and of man, properly organized and presented as educational instruments, are destined to be classified as true humanities. . . . I hope very much that the next decade may see intensive study of this aspect of these scientific problems, and of scientific work; and that out of it all may come, not a larger place in the educational program for the sciences, because that would hardly be possible—but a more effective, a more uplifting, and a more humanizing result of teaching the sciences, in order that we may pass on to the next generation this new educational instrumentality organized and perfected for true educational work, which never can be limited to the passing of information from hand to hand, or to mere instruction by master to pupil."

It is probably not necessary to state that in these words President Butler has voiced a conviction that is now both

widespread and rapidly deepening among educators generally. For the last five or six years they have been gradually awakening to the serious faults in the teaching of the sciences, and have already begun to organize themselves for a scientific study of the problem. Significant among the facts that show the prominence that this subject of the teaching of the sciences has attained is the action of the American Association for the Advancement of Science, at this same meeting in New York, in establishing a new section on education, with the United States Commissioner of Education as its first president. Preliminary steps were also taken at this meeting toward the organization of an American Federation of Teachers of the Mathematical and the Natural Sciences, for the purpose of studying this same problem in a broad and a comprehensive way.

In addition to these large movements, which are doubtless destined to be of vital import to our national system of education, numerous less extensive organizations have recently been effected for the purpose of studying this same problem either in some particular locality or in some particular branch of science. Among such organizations, which have appeared within the last ten years, may be mentioned the various associations of teachers of mathematics, of physics, of chemistry, of biology, or of all combined. The members of these associations are all teachers actively en-

need in the work of teaching science. The associations themselves, about thirty in all, are vigorous and flourishing organisms, several of them having an enrollment of over 300, and one of them of over 500 members.

The kind of work that these associations are doing, either individually or in co-operation with one another, may be illustrated by an investigation that 16 of them are now carrying on concerning the teaching of the subject of physics. Each of these associations has appointed a committee to represent it in the work, and all the members of these committees have organized into one large committee or commission. This commission consists of 60 members, 56 physics teachers and 4 specialists in the theory and practice of education. A year was devoted to the gathering of information by means of a distribution of printed questionnaires, each of which, after the first, contained a summary of the answers to the questions in the preceding one, besides further questions for consideration. In this way there has been carried on a sort of running discussion, to which more than 500 physics teachers have contributed ideas, criticisms and suggestions.

The subject of physics is, perhaps, at present the most prominent and typical of all the sciences in the school programs, both because of its magnificent opportunities to organize in the pupils a science that is founded almost exclusively on their own daily experiences, and because, like the steward who hid his one talent in the earth, it has most egregiously failed to make use of its opportunities and has therefore become one of the most hated bugbears in the entire school program.

There can be little doubt that the mental muddle evolved by the present methods of teaching the elementary physics is something appalling. As an example, we may quote an experience of one of the State high school examiners on a visit to one of the schools under his jurisdiction. He found two girls watching a pendulum that was swinging in a doorway. On asking what they were doing, one of them ventured to reply that they were trying to find the center of gravity. When asked what center of gravity, the other volunteered the information that

they were not trying to find the center of gravity of anything, but rather were endeavoring to measure gravity. The examiner then asked whether they measured it in feet, or in pounds, or in quarts, or what, and they both confest that they did not know, and were unwilling even to try to guess.

This example may be extreme, yet we will use it, both because the incident actually occurred as stated, and also because it brings out clearly some of the points which need emphasis.

One of the first points that appears, on considering this incident, is the total isolation of the problem on which the pupils were set to work from any problems likely to suggest themselves spontaneously to them from their own observation of the phenomena that surround them and that form part of their daily experiences. But even if it is granted that the presence of pendulums in some clocks is sufficient justification for the introduction of this experiment, there yet remains that yawning chasm between the concrete reality vibrating in the doorway and the abstract "gravity" which was to be measured by means of it—a chasm that may be bridged, even for the physicist, only by a rather long series of mathematical trusses, struts, ties and supports.

The situation is not ameliorated by the fact that the quantity to be determined in this case is not measured in simple, familiar units, like the pound or the quart, but in a strange unit called the centimeter per second per second. And when all is over, and the work has been written up in the notebook, and is ready for presentation as part of the credentials for entrance to college, may we not fairly pause and ask, "*Cui bono?*" Is the student, because of his having been driven thru this mill, better prepared to enter upon the duties of life and to cope successfully with its problems? Or will his experience with experiments of this sort tend rather to develop in him not only a contempt for science, but also a habit of trying to absolve real problems into a system of strange abstractions, which, because of his having committed to memory their names and definitions, seem to him to furnish a real solution?

Other exercises which are usually

found in the laboratories of the secondary schools, and which exemplify faults similar to the ones just mentioned, are those devoted to measuring for measurement's own sake, and those which claim to enable the student to determine constants and coefficients of various kinds. Since the numerical values to be obtained are all known in advance, these experiments not only lead to results that have no real value, but also, what is worse, they drill the student into habits of trying to reproduce, instead of training him in the ways that will enable him later to produce.

Perhaps these few instances will suffice to indicate what are some of the most prominent defects in the present methods of teaching physics. These are: 1. The organization of the course about phenomena, problems and apparatus that are wholly foreign to the daily experiences and thought of the pupils. 2. The treatment of the phenomena and the solution of its problems in terms of a strange terminology, based on abstract concepts which the pupils are not yet able to comprehend. 3. The encumbering of the pupil's mind with what a recent French writer appropriately calls a "*baggage des mots*," without imparting to him much, if any, ability to use his knowledge effectively. 4. The training that is given in habits of reproduction and imitation, at the cost of developing powers of production and of individuality.

There are many other practices that have become thoughtlessly habitual in the teaching of science, and that injure seriously its effectiveness as an instrument of education. A number of these are common to the teaching of science and that of the other subjects, for in thus diagnosing the weaknesses of science teaching we do not by any means wish to infer that the sciences have cornered all the poor teaching. It is only because science possesses such an incomparable wealth of educational materials and of educative power that we science teachers are more blameworthy than our less fortunate colleagues, who are trying to make the most of their more limited resources. Unlike the stewards in the parable, we, who have had five talents entrusted to us, have buried them in the ground, while others, our classical breth-

ren, perhaps, who have but one talent entrusted to them, are assiduously trading and seeking to increase the educational purchasing power of their resources.

In the light of these facts, what should be done to avail ourselves more fully of the educative power that is inherent in the sciences? This question was submitted to fifteen hundred physics teachers in one of the circulars that have been issued by the physics commission. Portion of the summary of the 280 answers that were received is here given, the numbers in parentheses indicating the number of teachers who suggested that particular idea (*Cf. School Review*, June, 1906):

Physics should be closely co-ordinated with the daily life and experiences of the students (55). This should not only be done by making the practical applications prominent (40), by bringing the work into close contact with industrial operations (8), by visiting industrial plants (8), but should also lead us to make the problems simple, concrete, and dealing with phenomena familiar to the student (16), and even to found the discussions on the common experiences of the students rather than on the laboratory apparatus (14). In any case, the value of the principle under consideration must be evident to the student (14), and he must be given a clear understanding of the essential points involved (6). We must give less theoretical and abstract work, and a greater number of applications of the theory that is given (20).

That the method of presentation should be accommodated to the mental states of children of fourteen to fifteen is suggested by 14, and will doubtless be agreed to by all. We should always begin with physics in the service of humanity, developing the concepts used from the everyday experiences, making it less abstract and more human (5); we chill the student's enthusiasm at the start by confronting him at once by a (to him) strange set of problems and concepts couched in a strange terminology (4). The student craves at that age the explanations that can be given only in the light of the greatest generalizations of science; yet these explanations must be applied to his immediate activities (3). Hence we should cling closely to the largest principles, and let him come to comprehend gradually their meaning and scope by constant application to his own experiences and problems (5). We should introduce vastly more historical and biographical matter (14), and should show the close bearing of science on the world's progress (7). We should lay greater emphasis on the method of thought used in scientific work, and less on the experimentation (9).

It is clear from this summary that the physics teachers are as yet far from being agreed on the needs of the situation.

For example, only 55 out of 280 suggest close co-ordination of physics with the daily life of the student. Yet this is surely a very necessary first step in the establishment of a new method of teaching the subject. Only four see the blasting effects of presenting at the start problems which are strange to the student, and whose solution is couched in a strange and abstract terminology. None of them has suggested the necessity of replacing the training in reproduction by one in production; while but twenty see the need of teaching the student to apply what he has learned.

These suggestions may be applied rather easily to the work of the classroom. It is fairly easy there to reverse the method of presentation given in most texts, and to begin with a discussion of common experiences from which the conception of a principle is derived. It is not so difficult to make the principles thus developed clear and usable by means of suitable demonstrations and with the help of numerous easy, concrete problems, taken from real life. But the problem of the laboratory work is more difficult, complicated as it is by the possession of an equipment designed for the particular kind of work that is even now stilling the enthusiasm of the students.

One of the suggestions that has recently been made with regard to the laboratory work seems to offer a promising solution of this knotty question. It is that the experiments should be so conducted that the emphasis is placed on the efficiency of the device under consideration rather than on the so-called law which the device is supposed to illustrate. For example, the student should not be asked to find the law of the inclined plane, but rather to measure the efficiency of the particular inclined plane with which he is working. In the former case he tries to eliminate friction—to abstract the machine into an ideal one—and thus to get a result that is never true in reality. In the latter case, he tries to find out what that particular, concrete, real inclined plane can do; i. e., he measures how much work must be done in raising a certain object thru a certain difference of level by means of the plane, and compares this result with the work that must be done in raising the same ob-

ject vertically thru the same difference of level without the assistance of the plane. He thus finds out how "efficient" the plane actually is—and efficiency is, after all, the central problem in practical life.

Another simple problem of this sort is that of the still. Is it cheaper to distill your water and to pay for the gas that you burn in doing so, or to buy distilled water from the Hydrox Company? Here again, the problem is concrete, real, related to daily life, and involves the idea of efficiency. Incidentally its solution also involves the mastery of a number of experimental devices usually treated separately in the laboratory for the purpose of preparing the student for the future work of the physicist—a work which few ever do, since few become physicists. Such work also has the elements of production in it, since the result is not known in advance. A problem like this, therefore, constitutes on a limited scale a scientific research—and the spirit of research is the very soul of science.

Still another practical and easily managed experiment of this sort is that required to answer this question: Which furnishes the most light for the money, an arc lamp, an incandescent lamp, a Welsbach, an ordinary gas flame, or a candle? In solving this problem the pupil would again have to use intelligently a number of principles that are now embodied in the laboratory in a series of perfunctory, isolated, easily forgotten experiments, few of which are ever actually applied to any use by the student or illustrate the methods of actually making real tests in real life.

Examples of this sort may be multiplied indefinitely, each treating of a real problem within the comprehension of the student; each embodying the practical use of several important principles of physics; and each not only teaching the student the value of definite, quantitative, concrete information in enabling him to judge of the efficiency of anything, but also giving him a training in solving problems by the methods of science—methods which are fast becoming the cornerstone of our modern commercial, economic, social and spiritual life.

From the practical point of view, the

introduction of this type of laboratory work does not necessarily involve a large expenditure for new equipment. Thus for the problems mentioned, for example, very little is needed that does not already exist in every high school which makes any pretense of giving laboratory work. The necessary reorganization of the work does, however, necessitate an enormous amount of work for the teacher—a work which he can hardly be expected

to do without a considerable allowance of free time for its accomplishment. Hence, if school authorities wish to further this movement for a more vital teaching of physics, the first thing that they should do is to so arrange their programs that every science teacher who gives laboratory instruction has enough time to adequately organize his laboratory and to efficiently care for the apparatus.

CHICAGO, ILL.

An Almoner of Christ

BY HARRIET McEWEN KIMBALL

You will wonder, but, O friend, believe it—
This sweet tale that I am fain to tell;
We of little faith can scarce conceive it,
But this miracle a priest befell.

Hidden in his breast for swift bestowing
His last bit of money waiting lay;
For on Christ's own errands ever going,
In His Name he gave it all away.

Bit by bit his Master still supplied him
Who his face turned not from any poor;
Niggard souls there are who might deride him,
But no blessing enters at their door!

God, who knoweth, sends just such a servant
On his secret service serving Him;
Slothful souls like us, and unobservant,
Cannot see the way; our faith is dim.

Well, this good priest on his round of duty,
Sad at heart upon that summer day,
In the heat that scorched the summer's beauty
Sought the bedside where a young girl lay.

Life and death on either hand beholding,
'Twas not strange that she for life besought;
Life for her meant love and joy's enfolding,
Death the bringing of her youth to naught!

"Pray," she whispered, "pray I may recover!"
Life to her was everything most kind;
Earth one rose, and every friend a lover;
She too young or thorn or flaw to find.

So he prayed, as saints pray, gently pleading,
Seeing on her brow the signs of death;
For her endless welfare interceding
While he begged for her this mortal breath.

As God's priest, his holy mission ended,
From that bed he turned with tears away;
Through the stifling streets unconscious wended,
Save that something seemed his steps to stay.

Could he do no more to bless or cheer her,
No small thing upon the earthly side,
Just to bring his heart to her heart nearer
While she lingered—lingered, tho denied!

Pleasant Nature's vintage to the taste is,
Sweet the fruit of orchard or of vine;
Hasting with such haste as sorrow's haste is,
Bought he luscious pear and peach and wine.

"Just (within himself he said) in token
That my thoughts are with her night and
day!"
All that bit of money quite unbroken
Spent he for the child who dying lay.

Homeward then he sped, but thoughtless
thrusting
In his breast his hand, what did he find?—
He, who ever giving, ever trusting,
Saw the light where lesser souls are blind!

Lo! his bit of money, *spent, returned him!*
Could it be? Ah, no! he failed to pay!
Back he went—what tho the hot sun burned
him,
And had smitten strong men down that day!

Vendor, chemist, back to each he hasted,
For each purchase fain would pay anew;
"Nay, you paid! you paid!" they each pro-
tested,
"I'm not one who'll take what is not due!"

"Did I pay?" the good priest answered, trem-
bling,
All his soul within him strangely stirred;
Then as if unawed, his awe dissembling,
Dared he say to them no further word!

'Twas his last, that bit of money: knowing
This, he knew that it had been restored;
And between a guard of angels going
He with them could only praise the Lord!

PORTSMOUTH, N. H.

Literature

Shakespeare

Professor Johnson's *Shakespeare and His Critics* reviews with sobriety and moderation the development of Shakespearean opinion in the person of its most important representatives from Shakespeare's day to our own and traces the gradual formation of what may be called the canons of modern Shakespearean criticism. The book has all the convenience of an abridgement, as well as of a continuation, of Professor Lounsbury's "Shakespearean Wars," which deals with the critical controversies of the seventeenth and early eighteenth centuries alone and too minutely for the general reader. At the same time Professor Johnson's work is wholly his own and written altogether from his own point of view. As a survey it is rapid but not hasty; nor is it a mere compilation and digest of authorities but contains in every case sufficient independent criticism to orientate the reader. In some instances, like that of Hamlet in particular, the writer's own comments form something of an original contribution of themselves. In short, the volume is in reality a discussion and a very suggestive one of the subject from which it takes its name. On the whole Professor Johnson seems to think that the popular estimate of Shakespeare was at first in advance of the literary, and that the superiority of modern criticism has consisted in recognizing that Shakespeare's popularity and effectiveness is a thing to be explained and not disputed or ignored.

The new edition of Mr. Lee's standard biography of Shakespeare is simply a revision of the original. The changes are few, tho of some little interest. There is a new preface with an account of the four Shakespearean discoveries which have been brought to light since the first edition was issued ten years or so ago. In addition some errors have been cor-

rected; a few insertions have been made in the text and the footnotes in accordance with some slight shifts of opinion; and the bibliography has been brought up to date. On the whole the volume has been augmented in one way or another by about forty pages; and while none of the changes are of great significance, it is very well that a handbook like this should be accurately levelled up from time to time.

It is ill-knowing how to take a humorist when he writes of serious subjects. Otherwise it would be natural to suppose that Mr. Clemens in his skit on Shakespeare had set out to hoist the Baconians with their own petard. At all events for the ingenuous reader he has come pretty near to reducing the Baconian theory to an absurdity. In saying the most that can be said for it, he has delivered a feeble argument with such violence as to make it seem like an exquisite parody. To be sure the Baconian himself is but slightly susceptible to the refinements of irony, whether conscious or unconscious; but is it conceivable that even he can miss the following characteristic innuendo?

The bust, too—there in the Stratford Church. The precious bust, the priceless bust, the calm bust, the serene bust, the emotionless bust, with the dandy moustache, and the putty face, unseamed of care—that face which has looked passionlessly down upon the awed pilgrim for a hundred and fifty years, and will still look down upon the awed pilgrim three hundred more, with the deep, deep, deep, subtle, subtle, subtle expression of a bladder.

Mr. Swinburne's three plays are "Lear," "Othello" and "Richard II." The upshot of the paper on "Lear" seems to be that "social revolution" is "the watchword of the gospel according to Shakespeare." The point of the "Othello" comes in a comparison with Cinthio's "Hecatommithi" to show that if Shakespeare has not used the effective device by which the villain of the Italian "novel" gets hold of Desdemona's handkerchief by playing

Shakespeare and His Critics, by Professor Johnson. The Century Co. New York. 1900. 12mo. 75 cents.
Shakespeare, by Mr. Lee. The Century Co. New York. 1900. 12mo. 75 cents.

Shakespeare's Plays, by Mr. Swinburne. The Century Co. New York. 1900. 12mo. 75 cents.

upon her affection for his child, the reason for the alteration is that "in Shakespeare's world, as in nature's, it is impossible that monsters should propagate," and hence the Shakespearean Iago has no son to make use of. These curiosities of criticism are couched in Mr. Swinburne's usual grandiose and incontinent style of emphasis, while in his "Richard II" he is a little more temperate in pointing out with rather better reason the elegiac and lyric qualities of the drama, which he ascribes to the influence of Greene.

Mr. Foster describes his word-book^a very fairly as "a glossary of archaic forms and varied usages of words employed by Shakespeare." It is in no sense a complete concordance or lexicon to the poet, but is intended to anticipate his verbal difficulties and to be serviceable, according to the compiler's own suggestion, as a substitute for the linguistic notes with which texts are frequently overcrowded. As such it is sufficiently compact and comprehensive. At the same time it appears to have let some doubtful words slip thru altogether. It contains, for instance, a *reflex*, but no *reflection*. On the other hand, we cannot but regard it as an injury to poetry to assign the metaphorical use of a word a literal definition as tho it were after all nothing but another exact application of the term. Such turns, if they cannot be left to the intelligence of the reader, might be distinguished in some way from the *mots propres*.

On account of the great number of sources in the case of "Richard III"—there are eight quartos of the play to take into consideration in addition to the folio—this new volume of the *Variorum Shakespeare*^b is provided with a patchwork text, the additions of the quartos being incorporated with the reading of the first folio and indicated by asterisks, while irregularities in the quartos themselves are pointed out in the notes. As usual, the volume is remarkable for the completeness of material which makes the edition an indispensable possession to the Shakespearean, including the pertinent

passages from Hall's "Chronicle" and a reproduction of "The True Tragedie of Richard the Third," the older play on the same subject.

The City of Jerusalem. By Col. C. R. Conder. New York: E. P. Dutton & Co. \$4.

There is no one better equipped than Colonel Conder to sum up in a single volume all that has been accomplished in and around Jerusalem by the archeologists of the last half century, for he has taken part in this work more or less since 1872, and writes understandingly of all that has been done. He points to the fact that we have Hezekiah's own inscription in the Siloam inscription, and the text forbidding the Gentiles to enter the court of Herod's Temple, as discovered by M. Clermont-Ganneau, as well as many later inscriptions. The volume will, however, be best appreciated by those who wish to know precisely how much (or how little) has been done at Jerusalem, and many a reader will lay the volume aside wondering why so little has been accomplished of a definite character. He does not know the difficulties surrounding the conducting of excavations in the Holy City, and especially under the regime of Abdul Hamid. The author points out the reasons for the confusion in topography, and the enormous difficulties connected with the excavation of a city in which there are some six strata of buildings belonging to different periods. Add to this that Jerusalem is still inhabited, and is regarded with special reverence by the adherents of three great creeds, and the difficulties of thoro excavation are easily discernible. As a consequence traditions have been relied upon to a very large extent in locating the sacred sites in and about Jerusalem, and these are disposed of in a single chapter, which shows how little trust is to be reposed upon them.

The Federal Civil Service as a Career. By Elsie Kern Holtz. New York: D. P. Putnam's Sons. \$1.50.

The author of this book is an employee in the Federal civil service and has gathered his information at first hand. In exhibiting the conditions of

^aA SHAKESPEARE WORD BOOK. By John Foster. New York: E. P. Dutton & Co. \$3.00.

^bTHE TRAGEDY OF RICHARD THE THIRD. Edited by Horace Howard Furness, Jr. Philadelphia: J. B. Lippincott Co. \$4.00.

employment in the executive departments of the national Government, he has performed a task of great benefit to the general public as well as to those contemplating entering the Federal civil service. The "spoils" system of former times has left an impression on the public mind that Government employees are not only well paid and have an "easy time," but also are given ample opportunities of advancement to high places in the service. This, however, is a widespread popular fallacy. Since places in the executive departments are no longer filled thru the personal patronage of its individual members, Congress is slow to pass legislation tending to encourage efficient men to enter or remain in the civil service. In fact, except in a relatively few instances, salaries and conditions of employment in the various departments have not been changed for half a century, regardless of the new adjustments required by the constantly expanding activities of the national Government and the increasingly serious and difficult character of the work required of the departmental employees. The effect of all this is to discourage efficient men from remaining in the service. As the author points out, the Federal civil service is made up largely of men who are either incapable of succeeding in other lines of work, or who are merely in the service because of the opportunity it gives for training and equipping themselves for more lucrative occupations. The educational institutions at the nation's capital are crowded each year by Government employees of the "upper class."

The Psychology of Singing. A Rational Method of Voice Culture Based on a Scientific Analysis of All Systems, Ancient and Modern. By David C. Taylor. New York: The Macmillan Co. 1910.

This is a remarkable treatise—it may be an epochal book in its field. Almost without exception the modern teachers of singing pay little or no attention to the psychology of singing. Its attempt is to interest pupils in the intelligent operation and management of the muscles of their vocal mechanism; that teachers pride themselves on their "scientific" methods. Mr. Taylor says this is all wrong. He holds that psychol-

ogy is of equal importance with anatomy and acoustics as an element of vocal science. "Like every other voluntary muscular operation, tone production is subject to the psychological laws of control and guidance." By setting before us consecutively (1) a review of modern methods, (2) a critical analysis of certain theories of the vocal action which receive much attention in practical instruction, (3) a summary of all present knowledge of the voice, and (4) a comparison of the scientific and empirical methods of teaching, he develops his theory that first of all the pupil must form a perfect ideal of tone, and that this ideal is the prime requisite in the teacher; that thereafter the work of the pupil is to sing until he gets that tone and the work of the teacher is to guide him in doing it. In short, his aim is to prove the scientific soundness of instruction by imitation. He believes that this was the old Italian method, and probably rightly. He points out that the correct vocal action is naturally and instinctively adopted by the voice without any attention being paid to the operations of the vocal mechanism, and he would abandon all attempts at mechanical vocal management. Thus he would make the study of singing chiefly artistic and spiritual instead of purely technical. No doubt many a singing teacher will combat this as revolutionary; but Mr. Taylor's book is lucid and convincing. It is stimulating, too, and can hardly fail to accomplish a deal of good.

✧

The Lawrences of the Punjab. By Frederick Gibbon. New York: E. P. Dutton & Co. 1910. Pp. xvi. 308 pp.

Lord Lawrence and his elder brother, Sir Henry Lawrence, for nearly fifty years have enjoyed in the esteem of their fellow countrymen a high place among the builders of the British Empire. The heroic, unselfish character of the two brothers, the part taken by them in the terrible days of the Indian Mutiny, and the tragic death of Sir Henry Lawrence, while he was holding Lucknow as a barrier against the rebel Sepoys, have endeared the Lawrences to the hearts of all who love noble deeds. Mr. Gibbon has, therefore, rendered a real service to his country and to all the English speak-

ing world in presenting the history of their lives in this handy, attractive little volume. Mr. Gibbon does more than tell the story of the two brothers. In fact, without doing more, the story could not have been told, for the lives of the Lawrences required a background, and the background is one with which the reading public is in general little familiar. In Mr. Gibbon's pages the reader is given a comprehension of the land, the peoples and the problems of India—land, peoples and problems which are not uniform over the whole of the great peninsula, not even in the region of the Punjab, which was the scene of most of the activities of the Lawrences, but which offer the widest range of varieties and complexities. The story also makes clear how Great Britain won her Indian Empire; how, by a series of accidents incident to the operations of a peaceful trading company, the supreme authority over three hundred millions of people, some utterly savage, some barbarous, and some boasting of centuries of culture antedating the first glimmerings of civilization in Europe, passed to the British Crown.

The Journal of an Expedition Across Venezuela and Colombia, 1906-1907. By Hiram Bingham. New Haven: Yale Publishing Co.

In order to properly appreciate the work of Bolivar, in leading an army from Caracas to Bogota in 1819, the author of this book decided that he must follow the same route. Accordingly he spent four months in crossing the Llanos and the Andes, visiting the battlefields of Carabobo and Boyacá. Tho less famous than the historic marches of Napoleon and Hannibal, the expedition of Bolivar met with natural obstacles fully as great, and the result was the final expulsion of Spanish power from Colombia. It is unfortunate that the author adhered to the form of a diary in presenting his narrative. The descriptive chapter on Caracas is marred by twenty-five or more date headings and inconsequential details, and the same fault is noticeable elsewhere, where the continuity of ideas is broken up by the daily entries. Had the author used the diary to refresh his memory,

and written the account of his trip in regular book form, it would have made the work more readable and more valuable. Even as it stands the volume is one of great interest, and the numerous photographs are excellent. A map of the country traversed, in the form of a folder, is also a good feature.

The Playhouse and the Play. And Other Addresses concerning the Theater and Democracy in America. By Percy MacKaye. New York: The Macmillan Company. \$1.25 net.

This is a sturdy plea for the uncommercialized theater by the author of "Mater," "Jeanne d'Arc" and "Sappho and Phaon." No halfway measures appeal to Mr. Percy MacKaye. Above and beyond such privately subsidized schemes as the New Theater, planned to continue in America the best tradition of European dramatic art, he outlines his generous dream of a civic theater for the people—a true organ of democracy, wherein the soul of the New World shall find voice. He ardently hopes for our present age what Shakespeare achieved for the Elizabethans or what Sophocles and Aristophanes did for the Athenians. To attain this happy result, let us remind Mr. MacKaye, only three requisites are lacking: (1) Audiences, (2) playwrights, (3) actors. These, and not the mere physical building and maintenance of municipally endowed playhouses, constitute the chief difficulties. Meantime we should like to see the municipal experiment tried. Would the actors (like policemen) have political pulls, and would "Big Tim Sullivan" or "Battery Dan" be chosen by Tammany as the first director? Or, if the reformers captured the enterprise, would the latter shipwreck it by trying to "educate" the public instead of amusing it? Fortunate were the municipal theater if managed as capably as the municipal Carnegie libraries; thrice fortunate if its projectors, while recreating new audiences, playwrights and actors out of hand, attempted no Utopian flights. Let us welcome the poetic drama so warmly championed by Mr. MacKaye, but let us not forget that the art characteristic of this age is pedestrian, and that we must creep and walk before we can fly.

Literary Notes

....Those who hold the popular idea that dolls are of no interest to any one but children will have their minds expanded on the subject by reading *The Doll Book* (Outing Pub. Co. \$3), in which Miss Laura B. Starr describes her own collection and tells how Elizabeth, Wilhelmina, Mary Stuart and other queens have loved dolls, and how anthropologists have studied their history and significance.

....The first part of Volume II of Dr. G. Carotti's *History of Art*, translated by Beryl de Zoete, just issued, deals with early Christian and neo-Oriental art, and with European art north of the Alps during the first centuries of the Christian era, when in the East Byzantine art continued to flourish, while in the West Carolingian art gradually emerged from the Dark Ages, to be followed by Romanesque and Gothic, in France, England, Germany, Flanders, Italy, Spain and Portugal. The second part of this Volume II will be devoted to Italian art from the eleventh to the fifteenth century. Dr. Carotti's work is chiefly intended as a general survey of the subject and as a preparatory introduction to more detailed study. This purpose it serves excellently well, the illustrations, while much smaller than one could wish, being, on the whole, adequate. (E. P. Dutton & Co., 16mo., \$1.50 net.)

The Am ha-aretz, the Ancient Hebrew Parliament. A chapter in the constitutional history of Ancient Israel. By Mayer Sulzberger. 8vo., pp. 96. Philadelphia: Julius H. Greenstone. The purpose of this very acute and interesting study is to show that during the period of the Jewish kings they were not without a parliament, such as they had possessed in the *Edah* of the Mosaic and subsequent period, and corresponding to the eldership after 200 B. C. This was the *Am ha-aretz*, wrongly translated *people of the land*. They were the leaders of the people, and the author very persuasively interprets accordingly the story of the killing of Athaliah. The *Am ha-aretz* had earlier existed among the Hittites, and to them Abraham appealed for his purchase of the Cave of Machpelah. We recommend this fine volume to students of Jewish antiquities.

Pebbles

THE STORY OF THE PEBBLES

1. There was a man who by the name of Slosson, who was very clever.
2. The same came to observe and criticise, and finally he knew of all.
3. And he wrote a book concerning the life of the Freshmen and how they lived, and also of the faculty and preceptors.
4. And he wrote up his eyes and behold there was a system and they called it the Preceptorial System.
5. And the man Slosson thought that he was very good.
6. And he said to himself when he wrote the book, he put in it many things concerning the Preceptorial System.
7. And he said of the Preceptors that they live in the dormitories, of whom some remain

unto this day, but the greater part have gone to Paradise.

8. But of the Preceptors that live at the ends of the earth, even on Mercer Street and on Stockton Street, and in Broadmead, of these, verily, said he nothing.

9. And to prove his point, he gave references in the University Catalog and the Lit.

10. Now it came to pass that when he had made an end of writing on this subject, that he lifted up his eyes again, and behold there came unto him a student, having in his hands a book. Now the book was the University Directory; and as he went he searched diligently, till he had found the name of his Preceptor. Now the Preceptor lived hard by the University Field.

11. And the man Slosson lifted up his voice, and saluted the student, saying: "Ho, my boy," and the student turned himself, and came unto Slosson, for he said unto himself, "I will now go and see what is this new thing that has come to Princeton, and t'ell with my Preceptor."

12. For he knew not that it was Slosson.

13. And Slosson asked him concerning the life of the students, and the student answered him, according as he knew the answer, for he was a Sophomore, and withal ruddy and of a fair countenance.

14. And Slosson said: "Tell me now, I pray thee, what is the difference between a frat and an upper class club, and wherein do they differ from the clubs at Harvard?"

15. And when he spoke of Upper Class Clubs, the student blushed, for he was a Sophomore, and said: "Behold, the frats eat you and sleep you, the Princeton clubs eat you but don't sleep you, and the Harvard clubs don't do either."

16. And it came to pass that when Slosson heard this he rejoiced, and said: "Lo, thou hast an admirable mastery of the language."

17. And when he had made an end of speaking of clubs, they went together until they came to a place where there were many Sophomores and Freshmen gathered together.

18. Now there was much grass in that place.

19. Then Slosson and the Student lifted up their eyes and lo the Freshmen sat on the grass, and made as if they rowed; and there were toothpicks in their hands.

20. And the Sophomores laughed them to scorn.

21. And one of the Freshmen lifted up his voice and said: "How can we row without oars, for behold, this is but a toothpick!" And he broke it with his fingers.

22. And all the Sophomores puckered up their lips and whistled.

23. Then said Slosson: "Why do they this? for the Freshman hath said nothing amiss."

24. And the student said: "He is right."

25. Now Slosson wondered greatly, seeing the Freshmen obey the Sophomores in whatsoever they command.

26. For it seemed to him to be unfair.

27. And they answered and said unto Slosson: "Behold, the Freshmen like it." And he was very wroth.

28. And the following month he visited Stanford University—The Princeton Tiger

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

THE semi-annual index of THE INDEPENDENT is now ready and will be sent free to any subscriber who will notify us he wants a copy. Of course, those who return us their twenty-six issues for binding will have the index included.

The Assertion of Self-Respect

WE do not know how much truth there was in the newspaper reports of a snubbing administered by Orville and Wilbur Wright to certain patronizing Congressmen who went down to Fort Meyer, ostensibly to show their interest in an invention that might come in for a governmental appropriation, in reality, probably, to take a day off, and do the heavy standing around while the Wrights tried to fly. For our present purposes it doesn't matter whether or not the august Senators and Representatives were told that they were in the way, and had better go back to Washington and attend to their own job. If they were, we are glad of it. But the text is just as good, whether the incident happened or not.

For the little sermon that we want to preach from the text is, that we need here in the United States a little more of that

good old English bluntness on the part of modest men and women who know their own worth, when men and women of the arrogant sort get in the way or try to be patronizing. Our observation is that nowhere in the world are men and women of exceptional intellectual attainments so lacking in self-assertion as they are in the United States, and that nowhere else in the world are the upstarts, whose one source of power is their money, so ridiculously important in their own eyes. When the man of worth and the man of arrogance are brought into personal relations, the immediate result is a situation full of possibilities for the funny man or the cartoonist, but unfortunate as a factor in our social order. The man of worth fails to exert influence, and the upstart is permitted to "run things."

This phenomenon is a comparatively new one in American life. Wherever one opens the documents of American history before the Civil War, he is sure to discover interesting incidents proving the sense of dignity and real self-respect of the American farmer, mechanic, merchant, teacher, physician or clergyman. It was something in man himself that, in those days, was regarded as worth while and worthy of respect. Today, money is power, and not only does the man with money push himself into prominence and dictatorship, but also the man of personal worth holds his tongue and lets the upstart brag and boss.

It takes a certain amount of courage for an individual, face to face with a person politically or financially prominent, to tell him to stay on his own reservation and mind his own business. Americans have been inclined to regard the Englishman's habitual manifestation of this particular kind of courage as a disagreeable quality. Perhaps it is. But we are convinced that it is a necessary quality, and that its cultivation is an essential part of that eternal vigilance which is the price of liberty. We believe that the men and women of intellectual worth in America ought to cultivate it as an act of public duty, even at some sacrifice of their own feelings.

It takes no great courage perhaps, but it takes a certain willingness to speak unpleasant truths about the great ones

of the earth, to repeat from time to time that our Senators and Representatives at Washington are not always to be reckoned worthy representatives of the American people, and are quite proper persons for men of parts, like the Wright brothers, to snub when they get in the way. We say these disparaging things, not just for the sake of being unpleasant, but because we profoundly believe in government by and for the people, and hope that the people can be made to realize the practical truth that a vulgar, ignorant person, who has accumulated money by questionable means, does not become a statesman, or even a gentleman, by so simple a procedure as working a State Legislature until it elects him to the United States Senate, or that a ward boss or district leader who gets elected to the House of Representatives does not necessarily know more about important matters of public policy than the mechanic, the doctor, or the grocer does, who stays at home and unpretentiously attends to business.

It is fatal to republican institutions to substitute respect for success in "getting there," for respect for personal worth. And the men and women who are conscious of their own personal worth must do their part demanding and commanding the respect which belongs to them.

Another Essay After Church Unity

It was after the pronouncement for Church unity by the Episcopalian Convention at Chicago some twenty years ago, on the basis of the Quadrilateral, afterward revised and adopted at Lambeth Palace, that the Presbyterians attempted a long conference with the Episcopalians on that basis. Nothing came of it, for the fourth plank of the Quadrilateral was the Historic Episcopate, and they could not agree as to what it was. The Episcopalians claimed to have it and so did the Presbyterians, but they could not agree that both had it. The Episcopalians would not allow that the ordination of Presbyterian ministers was by a valid historic Episcopate, and so the correspondence ended in failure. As if God cares how preachers are ordained!

The bishops of the Anglican Communion meeting at Lambeth Palace last year made a further, but somewhat vague, expression of the desire for the unity of the Christian Church in its various divisions; and they recommended that meetings of ministers and laymen of different Christian bodies be held at convenient centers to promote a cordial mutual understanding.

A first meeting in accordance with this recommendation has been held in Hartford between Congregationalists and Episcopalians, called by the Conference of Congregational Churches of Connecticut. We may presume that it was initiated by Dr. Newman Smyth, who, tho he so vigorously opposed corporate union with the United Brethren and the Methodist Protestants, has written much in favor of a compromise with Episcopalians. With him, on the Congregational side, were Judge Simeon E. Baldwin and the Rev. Frederick W. Greene; and they were met, individually, by Bishop Brewster, of Connecticut, and the Episcopal clergymen, Dr. Francis Goodwin, of Hartford, and Drs. William R. Huntington and William M. Grosvener, of New York. They discussed the differences between the two bodies that must be solved in order to realize Christian unity and fellowship. It is interesting to consider their conclusions, which are not offered as final, but as tentative and in the form of questions.

And first, as to Worship. They ask whether it may not be proper that the Episcopal Church should recognize "in the congregations such freedom in worship as might be congenial and habitual among them." That is a good suggestion, and good because it means unity by comprehensive liberty.

The next point is Church membership. It is suggested to Episcopalians that confirmation does not constitute church membership, and that the Episcopal rubric requiring confirmation applies merely to their own children and catechumens, and so is no bar to unity with other bodies which have no such practice. This suggestion is also good, for it looks to tolerance under the law of comprehensive liberty.

Next as to Administrative Unity. They

ask whether the Episcopate might not be "adapted to other Christian Churches as an organ of fellowship and a means of executive unity in their common Christian interests." Probably it could; certainly it has been in part; but, as with the previous points, comprehensive liberty to do as they please in administration is a better basis of unity.

The next is Self-Government of Individual Churches. They suggest that churches be allowed self-government in local interests, "while general advisory functions, and some degree of Episcopal direction, should be secured in matters pertaining to the common work and welfare of the Church." That is feasible and essential; but under the conditions of comprehensive liberty would it not have been possible to recognize such Episcopal supervision as already existing in the common work of both Churches?

Finally comes the question of Ordination, which involves the interpretation of the Historic Episcopate. Here they were on ticklish ground, and the influence of Dr. Newman Smyth is patent in the suggestion which he has for some time been pressing, and which is here put forward. It is proposed that ministers of other Churches receive "additional authorization conferred by the bishops" of the Episcopal Church; while "additional or enlarged authority could thus be conferred upon the ministry of different religious bodies," this being "a long step taken toward the attainment of outward, visible unity." Certainly it would be a step toward visible unity if all other denominations should accept ordination by Episcopal bishops; but there is another way which may be better and more brotherly, that the Episcopalians should accept the ordination these Churches already possess. The only reason for asking reordination is that the present ordination is thought to be defective. But those denominations do not hold it to be defective and inferior. They allow no primacy to any other Church, and it will be perfectly futile to attempt to persuade them to come under the Episcopal authority. They would not seem to assent, even for unity—no, not for an hour—that their ministers must depend on a historic succession of palmar grace, any more than Paul would consent, for the sake of unity, that Titus should be cir-

cumcised. There is only one condition of unity, and that is of comprehensive liberty.

It may amuse Dr. Smyth to confer along this line, but no more will come out of it than when some years ago Dr. Smith, of Baltimore, wrestled with the same problem in behalf of the Presbyterians. There are just two kinds of unity, and we are working for both. One is by corporate union, such as that of the Presbyterian and the Cumberland Presbyterian Church; and such as the union of the Presbyterians and the Congregationalists in South India. That is absolute unification, and the best thing where possible. The other way is by federation, like that already achieved by the Federal Council of Churches. That is on the basis of comprehensive liberty. Congregationalists may claim under it that their pastors are historic bishops, and Episcopalians can claim that their bishops are of a peculiar order of the third degree of superiority. But each allows the others to hold their views, and yet each fellowships each, as all parts of the great Church of Christ. The Connecticut Conference of Churches will do better work in strengthening and localizing the Federation than it can in seeking union by discrediting its spiritual liberty. And we end with the question how the Connecticut clergy are to be assured that they will get the true ordination. The largest Episcopal authority, that of Rome, has refused to recognize Anglican ordination as valid. But the validity of ordinations! What an empty question to be concerned about!

The Political Murder in England

THAT the act of a foolish, inflamed youth in London should affect the British policy in India we cannot believe, but that it should produce a tremendous impression we can well understand. England has not for a long time suffered from political assassinations. They have had them in years past in Ireland, and in Spain, France, Italy and Russia they may be expected at any time; and the police are as careful to protect Czars, Sultans, Emperors, Kings and Presidents as we are in our unfortunate country, where the President goes nowhere without two Secret Service men close at

land. But now a misguided fanatic nation, proud to die for his country, has in the most public way, shot and killed a leading adviser of the Secretary of State for India, and from now Lord Morley himself will go guarded against the danger of assassination.

There is in India, particularly in Bengal, a comparatively small number of students and agitators, whose passion is directed against England. They have been guilty of several murders of officers of the Government. They think that they are oppressed, and they argue that political murders are no murders at all, but are most honorable acts of war. Those who are induced to do such acts are told that they are heroes and that their names will be acclaimed as of patriot martyrs in the day when India becomes free of British tyranny. Among the Hindus in England, particularly students, there is a small number of such youths, and it is one of them who has been guilty of this crime, a crime which will be held detestable by the great mass of intelligent Hindus as well as by the English people.

Unfortunately, there are a few such misguided Hindus in this country. They do not preach murder, so far as we know, but they preach the language which might lead to it. They tell fearful stories of oppression and poverty. Every evil, every famine, is charged to British rule. They falsify the facts as to taxation and commerce. They have found Americans to join with them in this campaign against Great Britain. Only the other day the report came of an American known here for his part in this work who has been expelled from a London hotel for his activity in this matter. We have had reason to denounce the efforts made by some of these agents here to mislead public opinion. Much more will they be active in England with their band of them in India, and now we have the natural result in assassination.

But the British Government and the English people are not going to reverse the general policy because of this sad crime. Lord Morley has given India more of self-government, and it is the plan to add such measures as fast as possible. It is not generally considered how late a part of India—over one-

third—is administered by native rulers. In 1882-84 the elective principle was extended, in larger or smaller measure, all over India for local self-government; and within the last year the Council of the Governor-General, which administers the Government, has been made representative of the native Indians, as well as of the British residents. Indeed, there is no office—legislative, administrative or judicial, below that of Governor-General—that is not held by native Indians. We do not mean to say that this process of self-government is not likely to go much further, but it has already gone about as far as is now safe for the peace of the country.

We must not be surprised at such outbreaks of ignorant fanaticism. It is a part of the froth of yeasty liberty. We shall discover it in Porto Rico and the Philippines. It comes not because we govern, for there are the same outbreaks and murders and revolutions in similar populations, like Cuba and Venezuela, which have self-government. Against violence there must be repression; yet it must be the policy of Great Britain to give native races under her government as rapidly as possible the same self-rule as is allowed to Canada. But this means first general education, which is a slow process. Under the same principles, our own Government should not hold Porto Rico and the Philippines independently as subject colonies, but should develop local self-government, until they shall be received, before very long, as Territories, and later as equal States of the Union. With them education is being rapidly extended, and the use of the English language, which is the chief factor in producing a common civilization and culture.

Commissioner Leupp's Service

THERE are only about 300,000 Indians in the country, but they count large in national obligation. For this reason, it is well to make record of the ablest and most intelligent administration of the Indian Bureau under the direction of Commissioner Leupp. He resigns on account of his health, to be succeeded by his first assistant, Mr. Valentine.

Commissioner Leupp did not enter on his service like all his predecessors after

the first one, quite ignorant of his business, for he was chosen by President Roosevelt wholly because he was devoted to their interests. His aim has been to encourage the Indians rather than to force them into civilized self-support. The list of improvements he has made in these four and a half years is a long one. We may mention some of them: He began by starting an employment bureau, by which Indians needing work and work needing laborers, mainly off the reservations, are brought together. As a result, thousands of Indians can be seen at work on railroads, lumbering, teaming, etc., much to their advantage, and proving that centuries of hunting do not disqualify men for industry. He has organized a corps of officers to fight the liquor traffic and secured appropriations therefor. He has secured the enactment of the "Burke Law," under which, when advisable, an Indian can receive his patent in fee without waiting twenty-five years for his trust patent to expire. Under this law he becomes a citizen when he gets his fee patent instead of his trust patent. Also, by another law, the Indian may cut loose from his tribe, if competent, and have his share of tribal funds set apart for him, with its income under his control. A matter of high policy is his addition to the number of reservation day schools, and the reduction in the number of non-reservation boarding schools. Thus the Indian children are allowed to live at home and their parents feel the influence of the schools where their children attend. Of course this has been resented by Congressmen in whose districts large and profitable boarding schools have been supported by the Government, and only a part of those have been closed which the Commissioner had recommended to be dropped. Further, in sparsely settled regions white children have been allowed to attend Indian schools, to the betterment of friendly relations between the races.

Another policy has been the dividing the large agencies into smaller ones, so that the officer in charge may personally know his Indians.

It has been Commissioner Leupp's policy to open the reservations for settlement as rapidly as possible, thus bring-

ing Indians and whites into mutual relations as citizens. Nine reservations have thus been opened in whole or in part.

We might mention other improvements both in the office and in the field. The office has been wholly reorganized, to its great advantage. Much has been done for health, fighting tuberculosis and trachoma. There has been established a "roll of honor" for Indians of reliable character and ability. Indians no longer make signatures by "marks," but by thumb-prints, avoiding occasion for fraud. All these make a record of progress which reflects great honor on the earnest and intelligent faithfulness with which Mr. Leupp has conducted the business of a difficult and not agreeable office.

\$9,000,000 a Pound

THE prices of rare metals quoted to astonish the public are usually fictitious; for these elements, not being in demand, have no true market value. But one of the rarest of them, radium, has so much scientific interest and possible practical importance that it has become a commercial product. We may regard its present price as determined by the largest order ever given for it since its discovery, the order recently placed by the Radium Institute of London with a Cornish mining company for $7\frac{1}{2}$ grams of pure radium bromid at the rate of \$20 per milligram. This amount, a little more than a quarter of an ounce, is more than exists now in all the laboratories of the world and it will be a long and arduous process to extract it from the pitchblende in which it is diffused in extremely minute quantities, about one part in 4,000,000. It is to be used in experimenting on the cure of cancer, as there have been some very encouraging reports of the disappearance of superficial cancers under the influence of its radiations. It is, at any rate, natural that in seeking a remedy for one of the most fatal of diseases we should turn with hopeful anticipation to the most powerful of substances. The energy it gives off is a million times greater in its sum than that produced by the hottest known chemical reaction, the union of hydrogen and oxygen to form water. Slowly,

spontaneously and continuously it decomposes, and we know no way of locomotion or of steering it. Whether it is cooled in liquid air or heated to its melting point the change goes on just the same. This quarter ounce of radium salt will give out enough heat in one hour to melt a quarter ounce of ice and in the next hour will raise this water to the boiling point, and so on, again and again without cessation for thousands of years, a fire without fuel, a realization of the philosopher's lamp that the alchemists sought in vain.

What will be left of it when at the end of, say 26,000 years, it ceases its mysterious activity, we do not know, nor has any person yet seen radium, that is, the metal itself, for not enough of its salts have been gathered to prepare it. This \$750,000 worth that has been ordered will probably never be brought together in a single test tube. If it were one would not like to be in the same room with it. For the faint fire mist which would be ever rising from the heavy white salt, like a will-o'-the-wisp from a swamp, has a potency that no man dreamed of a few years ago. This emanation will rot away the flesh of a living man who comes near it, causing gnawing ulcers whether it can cure them or not. It will not only break down the complex and delicate molecules of organic matter but will attack the atom itself, changing, it is believed, one metal into another, copper, for example, into sodium, the fulfilment of another dream of the alchemists. And its rays, unseen and unfelt by us, are yet strong enough to penetrate an atmosphere and photograph what is behind it.

But radium is not the most mysterious of the elements, but the least so. It is giving out the secret that the other elements have kept. It suggests to us that all the other elements, in proportion to their weight, have concealed within them similar stores of energy. Astronomers have long dazzled our imaginations by calculating the horse-power of the world, making us feel cheap in talking about our steam engines and dynamos when a minutest fraction of the waste dynamic energy of the solar system would make us all as rich as millionaires. But the

heavenly bodies are too big for us to utilize. We cannot hitch our wagon to a star, unless perhaps it might be called that when we run a trolley car with a tide-mill.

And now the chemists have become as exasperating as the astronomers, for they give us a glimpse of incalculable wealth in the meanest substance. For wealth is measured by the available energy in the world, and if a few ounces of anything would drive a steamboat or manufacture nitrogenous fertilizer from the air, all our troubles would be over. But the atom is as much beyond our reach as the moon. We cannot rob its vault of the treasure. If radium could give us the key to it, it would be cheap at any price.

The Country Conscience

EVERY movement that undertakes to improve civic conditions and to give to a community better government is sure to find sooner or later that there must be an appreciation on the part of the public of the needs and worth of change. If this be lacking, the effort works against such odds as to discourage all but the most devoted and the rule of the bosses remains unbroken. In the larger cities this is especially true, and occasionally is found a student of economics who believes that the rural districts are as slow to respond to appeal. The comparative isolation of the people, the lack of quick communication thru the press, and the self-satisfaction of the average farm dweller are pointed out as making less forcible the appeals to action.

Sometimes this seems to be the condition and there arise incidents showing how agricultural States are suffering from unworthy rule long after the way has been shown toward correction. But on the whole the country conscience is sensitive and responsive where the big city is not.

For instance, out in the Middle West a few months ago a leading paper in a city of 40,000 discovered that the county was being robbed thru an extravagant purchase of systems of filing cases that were being sold at exorbitant prices for use in the public offices. That it was a steal

of many thousand dollars was apparent and the paper, determined to save money for the taxpayers, gave the facts and "spread" the story in its most emphatic manner. Day after day it related the developments and counted on such an awakening as would prevent the consummation of the deal. It created some talk—but not much. It roused the public mildly—but men were busy and forgot it as the paper was laid aside with the morning coffee. The sale was completed, the county paid an enormous price for mediocre material and somebody pocketed the profits. Naturally the editor felt that he wasted his effort and was discouraged at the outcome.

The vendors of the filing cases moved on to a rural community a hundred miles away and opened negotiations for another sale. In the little country town that was the county seat was another editor who was not afraid. He had watched the fight in the city and sent for a file of the papers in which the first exposé had been printed. He published the same articles, localizing them to fit his home conditions, and waited to see what would happen. As his paper went out to the farms and into the villages the people read it and caught its lesson. On the following Saturday men were coming to town in buggies, in wagons and on horseback to see the county officials charged with the purchase of the new furnishings. They made their ideas known definitely and distinctly with the result that there was a cancellation of the contract and negotiations ceased.

The residents of the city and of the rural community were much the same sort of people with much the same familiarity of conditions and neither had much the advantage over the other in wealth or in the business aptitude. Yet in the country town and in the communities surrounding it there was a conscience that did not stop at learning the truth, but acted. In the city the truth brought only a passing interest and things went on much as before. Perhaps the incident, if thoroly exposed, might have had an effect at the next election, but no such response came to the immediate demand as was manifest in the rural section.

Doubtless the habit of being out-

spoken, of going directly to the head of a matter, has much to do with this difference on the part of the country community. The farmer and the dweller in the country town brook no red tape, the resources of so many city officials. The office-holder is known to every taxpayer and to every voter as a personal acquaintance, not as a newspaper name or as one who sits on the platform in a public meeting. He is called by his first name by half the population. He has a personal touch that is forbidden to the office-holder in the large city—and with this comes an added sense of responsibility promptly responsive to protest.

The country conscience is something that cannot be ignored; the city conscience frequently lies dormant and, tho realizing conditions, does not instigate definite action. This it is that makes possible the frequent charge that our large cities are badly governed. They need the quickening touch of the country conscience that would bring to the rulers a vital understanding of their position as servants of the people.

When the farmer, after years of toil in the field, moves to town for a well-earned rest, he marvels for a time at the calmness with which the townspeople accept unsatisfactory conditions. He wonders why they do not take matters into their own hands and bring about a definite reform. After a while, and possibly after some effort to act himself, he settles back with his neighbors and things go on much as before. His country conscience has become seared by the bustle and indifference of city life and it takes a great crisis to rouse it again.

It is to the credit of the cities that many of them are awaking to the evils in municipal government and are seeking to remedy them; they are gaining something of the country sensitiveness to civic iniquities. They find many things that need improvement, and when the total reaches sufficiently startling proportions there comes a public uprising that compels attention. Necessarily there must be more time for action in the city than in the rural district, but we cannot have too much of the country conscience in public affairs if we are to be well governed.

The Costliness of Saints

The leading Catholic paper in Germany, the *Germania* of Berlin, which sometimes ventures to criticise pretty freely things that happen within the pale of the Mother Church, recently published with critical purposes an account of the costs of a beatification, declaring that its information is from official sources.

It distinguishes between a public proclamation of a "blessed" person (beatification) and of one declared a saint (canonization). The costs for the former are: Introduction of the proposal, 10,000 francs; the process "non cultus," 2,000 francs; the process "de fama sanctitatis," 2,000 francs; the process "de validitate," 2,000 francs; the investigation concerning the "Virtues" of the candidate, 12,000; the Decree on this matter, 1,000; approval of the examination concerning the miracles performed by the candidate, 2,000; the investigation itself, 12,000; the "second decree," 1,000; the congregation and decree "de tuto," 3,000; the costs of the ceremony, 50,000 francs.

The expenses attending a canonization are these: Preparing the case, 2,000; approval of the miracles, 2,000; examination concerning these miracles, 12,000; the decree, 1,000; the congregation and the decree "de tuto," 3,000; cost of the ceremony proper, 100,000; other expenses, 50,000 francs. The total expenses of either of these ceremonies is accordingly from 200,000 to 270,000 francs.

Nowadays there are always two of such beatifications taken together in order to lessen the costs; but the *Germania* adds that this decrease is very small. It adds that in connection with such a ceremony, the decorations in St. Peter's cost more than 150,000 francs, the papal possessions, by actual count, cost about 2,000 francs for candles alone; the preparation of the papal throne at the recent ceremonies involved an expenditure of 12,276 francs; the candles on the altar at the High Mass cost 1,287; and the presents given by the postulants on this occasion to the Pope amounted to 1,438 francs; the new coverings needed for the altars on such occasions cost 13,000 francs; the rents paid to the Chapter of St. Peter for the utensils, etc., used is 18,000 francs; while at the last ceremony the presents and tips

given to the officials and servants of the Vatican amounted to exactly 16,396 francs. The architect of the ceremony of beatification received for his work 7,000 francs, and for his preliminary sketches an additional 1,200. The *Germania* closes its instructive list of expense items with a significant "and so forth"!

But who paid the money for the late canonization of Joan of Arc? Doubtless her French devotees.

A British Judicial Decision

English law is so similar to ours that the decisions of British judges are frequently quoted as precedents in our courts. For that reason, and because of the intrinsic interest of the case, we feel obliged to call attention to the verdict of the Court of Appeals in the action brought by Miss Gertrude F. J. Jenkins against the publishers of *Ally Sloper's Half-Holiday*. The question at issue was undeniably difficult, and it was no wonder that the lower court, under Mr. Justice Phillimore, was not able to decide it to the satisfaction of both parties. The limerick industry being a new one, there were few or no precedents to appeal to, and this is naturally disconcerting to a judge, because he is obliged to fall back upon his own mind. Besides a knowledge of law, a knowledge of prosody was required in this case, and not all judges are as well qualified as they should be to pass upon delicate questions of poetical style. In fact, the matter might have been thrown out of court if some one had had presence of mind enough to cite *de gustibus non disputandum est*. The judges in this case were Lord Justice Vaughn Williams, Lord Justice Fletcher Moulton and Lord Justice Buckley, and the question was the proper finish of the poem:

And a bottle among men of Doubtane,
Little Mary gave me quite a pain—
My heart's to queer
I can't drink bottled beer."

The two prizes of \$250 each offered by the enterprising periodical referred to were awarded to the authors who completed this literary gem by the verses:

"And Jamaica—it's rum—raises Cain (cane)"
and

"Lime depends on the lime, that's plain."

Both these obviously combine wit and

wisdom in the most remarkable manner, still it is no wonder that Mr. Jenkins, father of the poetess of that name, felt that injustice had been done his daughter, whose line—

"And as physic (fizz) (hic) I now take champagne"

received no prize at all, altho she had duly enclosed her sixpence with the coupon. We feel ourselves that if the other *envois* were worth \$250 apiece, Miss Jenkins's certainly deserved a shilling or two, for there is a sparkle, an effervescence about it, an onomatopoeic quality in its paronomasia, which is lacking in its successful competitors. The joke, altho rather too recondite, is carefully brought to the level of British comprehension by its parenthetical explanation. The three judges, however, concurred in dismissing the application for a second trial, and thus the press is vindicated.

Going to Church in Marseilles

A very pretty story is told in *The Catholic Columbian* from a private letter of a sailor in the American ships of the Mediterranean squadron. They were at Marseilles, and two hundred of them resolved on Sunday to go to mass at the Cathedral, a most commendable act of worship. So they marched, followed by a large crowd, until it became clear what was their errand. Then the crowd began to hoot and jeer, and there was fighting till the police intervened. They attended the service in a reverent spirit, but the crowd outside blew horns, rang bells, and finally burst open the doors to the disturbance of worship. The police made no effort further to keep quiet. When service was ended the American sailors formed and marched out, followed by the cat-calls of the mob. They returned to the ships and told the story, whereupon the next day, being a holiday, there was high mass at the Cathedral, and the whole mass of the sailors on leave, 1,200 strong, marched to the Cathedral. Of those 1,200 there were counted 486 who were Catholics; the rest were Presbyterians, Methodists, Baptists or of no faith; but they wished to give the rabble a lesson of the respect which American sailors pay to the Church. We quote, for it is a good story:

"So down the streets in the morning sun

shine we marched with a bugler corps and all the other trimmings. You should see the crowds that lined the streets. Some cowards that jeered us the day before shouted from the windows and shook their fists, but there was nothing like the disturbance of the previous day. The bullies and cowards were bluffed and bluffed bad. Well, inside the cathedral (we nearly filled it) the people almost wept for joy. The Protestant boys in blue who came with us acted just like we did in the church, they watched us and out of courtesy seemed to do whatever we did except to bless themselves, but thru it all they were itching for a scrap with that atheistic crowd."

We are glad those Protestant boys went to the Catholic service and took part like Christian gentlemen; and we suppose we are glad that those cowardly and profane ruffians kept out of reach.

Simplified Spelling in France

It is not in this country and England alone that the process of simplified spelling is going on; it is being pushed in France, and by an official commission. Their first propositions are like ours. They propose, first, to drop double consonants that mean nothing. They will then have *consone, honneur, monnaie*. Next, they will suppress *th, ph* and *y*; examples are *têatre, coriste, fénix, sinonime* and *lirique*. A third rule is to use *s* for all plurals in place of the present *x*; as *chevaus, eaus, beaus*, etc. This is only a beginning, for there are other absurdities to be corrected, altho not so many as in English. A French journalist remarks that the ultimate phonetic orthography toward which we must move is what is now practised by a large majority of Frenchmen and a larger majority of French women; and he gives as an example his housekeeper's memorandum, badly spelt today, but well spelt tomorrow:

"Jedi.—Un litre de rom, uil, pome de ter, beur, pin, salade de létu, une livre de vo, 8 frans 10 sous."

A Union Church in Hawaii

We commend to the consideration of Christian people of various faiths the example of the newly organized Kahului Church in the Hawaiian Islands. As its members were of most diverse training they had to drop all creedal statements and united on the following covenant as the basis of membership:

"I solemnly acknowledge my faith in the fatherhood of God, and sincerely acknowledging the leadership of Jesus, and His Spirit as the ruling principle of my life, I do now enter into covenant with this Church.

"I take your God to be my God, and will endeavor in my personal life, in the family, in the place of business, in the time of recreation, and in the house of prayer, to be accepted of Him.

"I take this Church to be my Church, promising as far as in me lies, to observe its Sacraments, to attend its meetings, to submit to its discipline, to share its work, to love its members, and to seek its unity, purity, and peace."

Among the members who organized the church were Americans and Europeans of various nationalities, Hawaiians, Japanese and Chinese. Religiously they had been Catholic and Protestant of many denominations, with those of Mormon, Jewish, Shintoist and Buddhist faith. It is a brief covenant, but those who accept and live by it will be genuine disciples of Jesus Christ.

The Georgia Railroad Arbitration

Governor Hoke Smith wanted arbitration, by

Georgia arbitrators, of the Georgia Railroad firemen's strike, and he has got a result which neither he nor the public expected. The arbitrators have decided in favor of the negro firemen, declaring that they should be retained, and going so far as to give them full wages, which they did not have before and the rights of seniority. To be sure, this does not allow them to graduate into the position of engineer, which is reserved for white men only. It is a victory for fairness and justice; and it will be well for those who made the strike to console themselves with the doctrine which they have been taught so assiduously, that inasmuch as negroes are inherently inferior they cannot do as well as white men. We fear that the giving of full wages to negroes will result in excluding them to some extent from employment, as the railroad may have preferred them, when equally competent, because of their inferiority.

One good effect of the Harvard-Yale boat race will be the relief of the financial stringency in the neighborhood of Boston. When Cornell beat Harvard last year the *Harvard Daily Torch* ex-

joiced that the merchants of that city were able to get the money owed them by the Cornell students. If Harvard had won they would have had to wait till fall—or later. We presume that the tailors and hotel men of Cambridge will get their due unless the rule that all money won in betting shall be "blown in" the night of the victory is strictly adhered to. But what will become of the merchants of New Haven? And what will become of the future wives and children of men who have been trained to prefer debts of honor to honest debts?

It is perfectly impossible from five couplets cabled of a long poem to judge adequately of the literary or lyric value of Rudyard Kipling's rimed assault on the Liberal Government's finance bill; but five couplets are enough to make us regret that he has written the poem. The bill puts taxes on the landed property, and that angers the aristocrats, and the poet, too, we are sorry to say. Sympathy with the hard-working classes would give the inspiration for a far worthier poem.

The murder case that is the sensation of the day does not prove the inhumanity of the Chinese, but rather their humanity. When a young woman writes love letters simultaneously to two men she may expect trouble of some sort, for, whether the skin be white or yellow, the blood beneath it is likely to be red.

The people are glad to learn that the Senate is likely to finish its action on the tariff bill this week. Heat shortens speeches if it expands everything else. We may now hope that the conference report will be ready a week or two later. When the report will be ready as Congress takes its flight.

A saner Fourth has halved the number of deaths this year. We make no fight against noisy celebration, but much more limitation of the use of powder by children is desirable; and particularly the prohibiting of Independence noise before and after Independence Day.

INSURANCE

The Pittsburgh Life and Trust Admitted to New York

THE Pittsburgh Life and Trust Company, which took over the business of the Washington Life, was last week admitted to New York and will hereafter be permitted to transact business in this State. Superintendent Hotchkiss issued the following statement in this connection, viz.:

The requirements insisted upon were, in substance, that property representing both the reserve and the surplus of the Washington Life Insurance Company remains within the State of New York as security for the performance by the Pittsburgh company of its obligations to Washington Life policyholders under the reinsurance contract; that there be established in the Pittsburgh company a Washington Life fund account, which should substantially separate the Washington Life business and assets from the business and assets of the Pittsburgh company; and that an equitable participation by the Washington Life policyholders in the surplus income of the assets which their premiums had accumulated be, in effect, guaranteed.

A further condition, that the withdrawal of the Pittsburgh company from New York should automatically accomplish the mutualization of the Washington company, was ultimately waived; the superintendent being advised by the counsel of the department that there was much doubt as to the enforceability of such a provision, and the New York law, as recently amended, seeming to give the department full power to seize the assets so on deposit in New York and to administer them for the benefit of the Washington Life policyholders, in case contingencies should arise apparently making this necessary.

Among the advantages given to Washington Life policyholders by the new contract are: (a) a limitation on the expense charges to 13½ per cent. of the premiums, which the Washington Life Insurance Company having usually absorbed the entire loading, that is, about 21½ per cent. of the premiums, is equivalent to an average dividend of approximately 8 per cent. on Washington Life premiums; (b) the entire savings on mortality; and (c) the entire gains from forfeiture and surrender charges. Washington Life policyholders are thus preferred, not only in these particulars, but also for their entire earnings from interest and investment profits. On behalf of the Pittsburgh company, it is stated that an actual analysis of the necessary working expenses of the Washington Life reinsurance business shows that this preference to Washington Life policyholders is entirely safe, fair and equitable to all parties.

The performance of all financial obligations of the Pittsburgh company is fully secured by the deposit and maintenance in New York, subject to the supervision of the New York Insurance Department, of assets covering all of the

equities of the Washington Life policyholders. The maintenance of this deposit is also guaranteed by a sufficient surety bond. More, under the New York State law, the deposit continues the Washington Life Company as a solvent, though quiescent, New York insurance corporation, ready to fulfil its own obligations if the Pittsburgh company fails to do so. Still further, by the contract and under the law, the superintendent is given ample power to supervise both companies, to enforce the reinsurance contract between them, to collect upon the bond, if necessary, and generally to safeguard the interests of the Washington Life policyholders.

The Pittsburgh company brings itself under the provisions of New York law, including the limitations applying to domestic corporations. The management and disposal of its real estate will be subject to the New York department's supervision. It is also provided that the contracts between the two companies cannot be abrogated or amended, save on the written consent of the New York Insurance Department.

As to the Pittsburgh Life and Trust Company, the New York department having found it to be solvent and its officers having thus co-operated with the department in an effort to secure a satisfactory supplementary contract which would completely protect the Washington Life policyholders is entitled to admission as the thirty-fifth life insurance company authorized to do business in New York.

Vice-Chancellor Howell, of the Chancery Court at Trenton, N. J., has denied the application of Leon F. Blanchard, of Newark, N. J., for an injunction restraining the Prudential Insurance Company of America from making to its industrial policyholders the concessions that were advertised to go into effect on July 1. Mr. Blanchard is the son of the late Noah Blanchard, one of the founders of the company, and is likewise a stockholder of the Prudential. His object in seeking the injunction was that a proper proportion of the unassigned surplus might be diverted from the disposition contemplated by the company and divided among the stockholders. Mr. Blanchard's bill sets forth that the balance of unassigned profits and surplus of \$16,693,690 appearing in the company's annual statement includes dividends in deferred policies, in violation of the law, and it is claimed that \$8,800,000 of the surplus, said to have been derived from deferred dividend policies and held as part of the unassigned surplus, does not exceed the amount to which the stockholders are equitably entitled.

Financial

Trade and Crops

STATISTICAL comparisons made at the end of the fiscal year show how encouraging has been the general improvement in business but comparisons relating to recent months are more interesting. For example, bank clearings for June exceeded those of May by nearly 9 per cent., and those of June a year ago by 43 per cent. Post Office receipts at New York have shown large advances since February. For the quarter just ended the increase was a little more than 12 per cent. June incorporations in the Eastern States represent a capitalization of \$212,500,000, which exceeds the total in any other month for a year and a half. Great activity in the cotton mills is reported, with much new construction in the South. In the steel industry, activity has not been checked by the hot weather. Prices are advancing, and premiums are demanded for prompt shipment. The Harriman roads have ordered 5,200 cars, for which about \$5,000,000 will be paid. Orders for 1,200 by other roads were given last week. Wage increases granted a week or two ago became effective on July 1, and other increases are now announced. In this industry the only retarding influence is that which is due to the strike at the tin plate mills. On the wrong side of the account, also, is an indicated reduction of the cotton crop. The Government's report, published on the 2d, shows that the condition of the crop is 74.0, against 81.5 a month ago and a ten-years' June average of 80.8. Prices advanced at once on the exchanges about \$2.50 per bale. The low condition is due mainly to excessive rains and the boll weevil. A month ago, some looked for a crop of 13,000,000 bales. The estimate now is 11,800,000.

The Lackawanna's Dividend

SINCE February last, the market value of the stock of the Delaware, Lackawanna & Western Railroad Company has risen from \$535 to \$680 per share, in anticipation of a special dividend which was announced last week. Stockholders

get 25 per cent. in cash; 25 per cent. more in cash, but applicable at their option to payment for their allotments of stock in a new coal company; and 15 per cent. in stock, on account of the absorption of two small subsidiary roads. Owing to the market price and for other reasons this is a very notable distribution. It is warranted by the company's accumulated surplus, and it is made just at the time when the company has completed arrangements for that formal separation of its coal business from its railroad business which the recent decision concerning the commodities clause of the Railroad Rate law requires. The new coal company, capitalized at \$6,800,000 and organized by leading stockholders and officers of the railroad company, will buy all the latter company's coal at the mines in Pennsylvania. Its stock will undoubtedly be taken (at the allotment of one share for four) by the railroad shareholders, and paid for by half the cash dividend. It will be observed that the railroad company will continue to own its mines and that its stockholders and officers will still control its coal business. This separation in form, however, complies with the requirements of the Supreme Court's decision.

....Among this year's victims of our prevailing method of celebrating the Fourth of July was Arthur Granville Langham, ex-president of the Provident Life Assurance Society, who died at Seymour, Ind., on July 5 from the effects of having had his right hand shattered by the explosion of a cannon cracker.

....Taxes on collateral inheritances received in the last nine months from the fifteen counties in New York which report directly to the State Comptroller were \$4,262,416, against \$3,484,750 in the corresponding months of last year. The tax on one estate was \$300,000.

...The stock transfer tax in New York during the six months which ended with June yielded \$2,431,008, or nearly \$600,000 more than the receipts during the corresponding months of 1908.

The Independent

VOL. LXVII NEW YORK, THURSDAY, JULY 15, 1909

No. 3193

Survey of the World

Passage of the Senate Tariff Bill

The tariff bill was passed in the Senate on the 8th by a vote of 45 to 34. Final action was taken a little after 11 o'clock in the evening. One Democrat, Mr. McEnery, of Louisiana, was counted with 44 Republicans in the affirmative. The ten Republicans named below voted against the bill:

Messrs. Beveridge, of Indiana; Dolliver and Cummins, of Iowa; Nelson and Clapp, of Minnesota; Brown and Burkett, of Nebraska; Bristow, of Kansas; Crawford, of South Dakota; La Follette, of Wisconsin.

Members of the conference committee were at once appointed. Members to represent the House were named by the Speaker on the following day. The full committee is as follows:

Senate: (Republicans) Aldrich, of Rhode Island; Burrows, of Michigan; Penrose, of Pennsylvania; Hale, of Maine; Cullom, of Illinois; (Democrats) Bailey, of Texas; Money, of Mississippi; Daniel, of Virginia.

House: (Republicans) Payne, of New York; Dalzell, of Pennsylvania; McCall, of Massachusetts; Boutell, of Illinois; Calderhead, of Kansas; Fordney, of Michigan; (Democrats) Clark, of Missouri; Underwood, of Alabama; Briggs, of Georgia.

In the Senate the members were chosen from the Finance Committee by seniority; in the House this rule was not followed. The selections have been criticised, owing to the predominance of Republicans from the East, and some predict that there will be a tendency to support the increases made by the Senate. The changes in the House bill which were voted by the Senate are 847 in number. The Dingley bill was in conference for eleven days. Before the vote in the Senate was taken, Mr. Beveridge and other Republican insurgents gave rea-

sons for their opposition. Mr. Beveridge asserted that the bill did not represent the views of a majority of the Republican party or those of recent Republican Presidents. Mr. Aldrich replied sharply, saying:

"In my long public service in this body and elsewhere I have seen many occasions when individuals who thought themselves wiser than their party associates have made the mistake of believing their own individual views were the views of the majority of their party associates. In this chamber I have seen them change from one side of this aisle to the other. On a memorable occasion in a great convention of the Republican party I have seen prominent Republicans, who like the Senator from Indiana, believed their individual views were the views of the party, rise and walk out of the convention. But the Republican party has gone on. The Republican party is a party of majorities. It is ruled by majorities. The Senator from Indiana does not speak for his party associates. He and his colleagues who will vote against this bill are merely recording individual views. He has no right to speak for the President of the United States. This bill carries out every pledge made by the Republican party. If any Republican Senator desires to vote against it because of his individual views he may do so, but he cannot speak for a majority of the Republican party without hearing a protest from me."

Whereupon Messrs. Nelson, Clapp and Crawford with some indignation criticised Mr. Aldrich's attitude and assertions, Mr. Nelson saying that neither Mr. Aldrich nor Rhode Island could read Minnesota out of the party. During a brief debate in the House, on the 9th, several Republicans resented the Senate's increases, and on the motion to send to conference, 17 voted with the Democrats in the negative. Nearly all of them are from the Middle West.—Action was taken upon many propositions in the Senate during the three days preceding

the passage of the bill. Internal revenue taxes on saloons were so increased that saloons will be added to the system. Provisions for a customs court were adopted, 40 to 47. An income tax was rejected again, 28 to 47. A countervailing duty on petroleum was imposed. This was approved by independent producers of oil. The duty is effective only on oil from countries that tax oil from the United States. Mr. La Follette attacked the proposed new basis of valuation and also the duties on woolen goods, but all of his motions were lost. By unanimous vote the Senate adopted the resolution for submitting to the States an income-tax amendment to the Constitution.—Mr. Aldrich unexpectedly accepted Mr. Clapp's motion that the income of holding companies (derived from the dividends of subsidiary corporations) be subjected to the net earnings tax, altho he said this would be double taxation. It is held that the net income of the Steel Corporation, for example, would be taxed, after the payment of taxes on the net earnings of its subsidiary companies. Many expect that holding companies will be exempted in conference, also that the tax will be reduced from 2 to 1 per cent. Building and loan associations, and religious, labor and charitable corporations have been exempted. In the debate an attack upon the Trinity Church Corporation, of New York, was made, and the corporation was defended by Messrs. Root, Depew and Kean. The exemption of mutual insurance companies is sought. The Treasury authorities have been informed that the constitutionality of the proposed tax will be tested in the courts by powerful corporations. It may be, therefore, that if the tax is passed the collection of it will be delayed.

Federal Control of Corporations In an address delivered at Paducah on the 7th, before the Kentucky Bar Association, Attorney-General Wickersham argued that the organization of corporations doing an interstate business should be controlled by Federal authority. Many, he said, would object to the controlling tendency of a national insurance law, but such a statute would

to him to be the inevitable result of economic conditions, and the enactment of it would logically follow the imposition of the proposed tax on the net earnings of corporations. Pointing out that much of the State legislation designed to "prevent pools and combinations in restraint of trade had proved ineffective as applied in one State to corporations chartered in another, he suggested the enactment of laws providing that no corporation shall be licensed to do business in a State if 50 per cent. of its capital stock is owned or held by any other corporation, domestic or foreign. "The device of the holding corporation," he added, "is the only thing which has made possible the rapid growth of the great Trusts and monopolies, and such a prohibition would go far toward their destruction."—A report of an interview with Mr. Wickersham at Paducah has been published. The questions related to the attitude of the Administration toward business interests, and to the work of Mr. Roosevelt. He said:

"We hope that certain lessons have been taught to the great vested interests of the country, but it remains to be seen how thoroly those lessons have been learned. We hope they have been so well learned that to a considerable extent the axe may be laid aside, but we have it ready to hand if it be needed. . . . This country has benefited immensely by the work of the Roosevelt Administration. There was absolute need of a tearing up of conditions which had come to exist. The work had to be done, and it was done with a thoroughness that was tremendous."

Bad Trusts, he said in conclusion, would be prosecuted vigorously. Lawbreakers would find no favor with the present Administration, but prosecutions would be undertaken only "after the most careful scouting."

Jikiri and his band of Moro outlaws, whom the troops and Philippine constabulary had been pursuing for several weeks, were overtaken on the 5th, near Patlan, on Jolo Island. They sought refuge in a large cave, at the mouth of which they fought desperately until all of them were killed. The troops had been assisted in the campaign by three small gunboats. In the fight three privates lost their lives and

twenty-four in the attacking force were wounded, three of these being officers of the Sixth Cavalry.—Returning from a tour thru Northern Luzon. Secretary Worcester reports that much progress has been made in checking wars among the wild tribes. One tribe of 100,000 has for nearly two years refrained from head-hunting. He sought to interest the tribes in athletic sports as a substitute for inter-tribal wars, and there is a prospect that inter-tribal athletic contests will be accepted. The tribesmen are beginning to build roads and many are turning to agriculture.—In Hawaii, there have been additional arrests of Japanese strike leaders for attacking non-union workmen. The *Jiji*, organ of the strikers, has been restrained by a court injunction from publishing articles which would incite to violence, and in the same order the strikers are forbidden to intimidate workmen or to boycott planters. During the recent visit of a Japanese naval squadron, Admiral Ijichi, the commander, declined to receive two of the strike leaders who sought an interview with him.—Agents of the planters have failed to obtain workmen in the United States, but have engaged several hundred in Portugal.

Cuban Affairs

President Gomez has annulled the contract with German and French manufacturers for rifles, cannon and ammunition. General Guerra, commander of the army, has been directed to make inquiry in Europe and the United States concerning the purchase of these supplies. Manufacturers in this country complained because they were not permitted to bid, and their complaints were sent to Havana by our Government. Before the contract was annulled, a report was published that the orders had been placed in Europe because the Cuban leaders reasoned that, in case of war with the United States, their army could not procure ammunition to fit rifles made in this country.—Congress, which adjourned on the 9th, failed to approve the budget before the date (June 30) fixed by law, because the Senate was engaged in discussing a bill to legalize cockfighting. Therefore the President by decree ordered that the appropriations of the preceding year be continued. On a

later date the budget was approved and the decree annulled, but some hold that the belated action of Congress was unconstitutional. The bill to legalize cockfighting was passed and has been signed.—Representative Monleon denounced Speaker Ferrara in the House. The Speaker sent a challenge and a duel was fought with swords, on the 3d. Both men were wounded slightly.—The *Medical Record*, published in New York, asserted recently that yellow fever was prevalent in Cuba and that the authorities concealed its presence by calling it pernicious malaria or malignant jaundice. This is denied with indignation by the authorities, who say that no case has originated in the island for more than a year, and that only one case (that of a traveler arriving from Mexico) has been found there during that time.—Altho the crop of sugar is the largest on record and the prices received for it are satisfactory, credit is greatly restricted and it is very difficult for planters to borrow money. This is said to be due to lack of confidence in the stability of the new Government.—The lottery bill has been signed, but there is a quarrel about the management. Senator Delgado, who was appointed director, promptly resigned because the Secretary of the Treasury had appointed all the other lottery officers without asking for his advice.

Rico Porto

Congress at Washington having failed to pass the bill suggested by President Taft, the new fiscal year in Porto Rico opened with no legal provision for the payment of insular expenses. The local Government is cutting down expenditures, and is promising that salaries shall eventually be paid. Many American school teachers have sailed for home in the States. Forty arrived in New York last week. They assert that public sentiment is noticeably hostile to the United States in some parts of the island.—The population of Porto Rico is estimated to be 1,043,800. Recent reports show that great progress has been made in suppressing the disease commonly called anæmia. There were only 1,758 deaths from this disease last year, against 11,855 in 1901, when the Anæmia Commission began its work.

THE PRESIDENT'S SUMMER HOME AT BEVERLY, MASS.

Revolutionary Movement in Colombia

Troops stationed at Barranquilla, the most important commercial city of Colombia, turned against the Government, on the 4th, capturing the forts and public buildings. Their possession of the custom house gives them a considerable advantage, because about four-fifths of Colombia's imports are received at Barranquilla and its neighboring seaport, Savanilla. Among the prisoners taken were the commander of the Colombian army and the Governor of the province. There was little resistance, the people being in sympathy with the revolutionists. The revolt was against the authority of the absent President (General Reyes) and General Holguin, who is ruling in his place. It was said to be in the interest of Gonzales Valencia (formerly Vice President), but he has issued a manifesto expressing his disapproval of the uprising. The Government declared martial law and has sent troops to Barranquilla. With the consent of General Holguin, a non-partisan organization of the friends of peace will urge the revolutionists to lay down their arms. On the 9th, he sent the following telegram to a Paris newspaper:

"The revolution occurred at Barranquilla, leaving all parties outside the outbreak and not asking the revolutionists to lay down their arms. The Government troops are collected for the maintenance of order. The Government must very respectfully ask Europe for funds to

assure the regular payment of the Colombian debt."

There are signs, however, that the uprising will not be confined to the northern city. There is discontent in the southern provinces, and some think a general revolution is at hand. President Reyes, now in Paris expresses the opinion that the outbreak was purely local. Valencia, he says, is his friend.—The President of Argentina, as arbitrator, has announced his decision concerning the disputed province of Acre, which Bolivia sold to Brazil. It partly sustains the claim of Peru, to which about half of the province is awarded. Because of this decision, a mob of Bolivians, on the 9th, attacked the Argentine legation in La Paz, and troops were required for the protection of the Argentine Minister.

British Suffragists

The Women's Freedom League, which was organized for the purpose of carrying on the agitation for woman suffrage by less violent methods than those of the suffragettes, has scored a tactical point in getting a petition received by the Home Office. This they accomplished by going to Buckingham Palace and attempting to see the King. King Edward declined to receive them on the ground that it was unconstitutional for the sovereign to receive in person a petition for an amendment of a law, and referred

them to the Secretary of State for the Home Department as the constitutional channel for such communications. In accordance with this the delegation from the League, headed by Mrs. Despard, sister of Gen. Sir John D. French, addressed themselves to the Home Secretary, the Right Hon. Herbert J. Gladstone, who received them courteously and expressed his personal opinion that the matter would be finally settled in a way satisfactory to the petitioners. In reply to the argument that Premier Asquith had acted illegally in refusing to receive their petition, he said that the question had not been raised for 250 years and would have to be settled by the courts. It was impossible for any individual minister to receive a deputation whenever he was asked to do so. Deputations from the Freedom League watch at the different entrances of the House of Commons when Parliament is in session in the hope of catching the Premier. Since they do not make a noise or attack the police they cannot be arrested, but stand as silent sentinels all night even in the fog and rain. The band of four set to watch Mr. Asquith's official residence in Downing street succeeded in catching him and forced a petition into his hand. As they refused to leave they were arrested. Nothing is likely to be done with the 116 suffragettes who were arrested on June 30th for trying to get into the House of Commons. Mrs. Pankhurst and Mrs. Haverfield, the leaders, were sentenced to pay a fine of \$25 each or spend a week in prison, but sentence is suspended until the appeal on the question of the right to petition the King or his ministers is settled in a higher court. Miss Wallace Dunlop, who was sent to prison for a month for posting notices on the walls of the Houses of Parliament, secured her release after five days by adopting the tactics of the Russian political prisoners. She organized a hunger strike and after refusing food for ninety-one hours was discharged.

The Assassin's Defense

Madha Lao Dhingra, who killed Sir Curzon Wylie and Dr. Lalcaca, at the reception of the Imperial Institute, posed as a patriot and martyr when arraigned

in the Westminster Police Court. Before being committed for trial on the charge of murder he was asked if he had anything to plead in defense of his act, and he made the following statement:

"I don't wish to say anything in my defence, but simply to prove the justice of my deed. As for myself, I don't think any English law court has any authority to arrest me and detain me in prison or to pass a sentence of death upon me. That is the reason I do not have counsel to defend me.

"I maintain that if it is patriotic for Englishmen to fight against Germans if they were to occupy this country, then it is much more justifiable and patriotic in my case to fight against the English. I hold that the English people are responsible for the murder of 80,000,000 of my countrymen within the last fifty years. They are also responsible for taking £100,000,000 every year from India to this country.

"I also hold the English responsible for the hanging and deportation of my patriotic countrymen who do just the same as the English people here are advising their countrymen to do. If the Germans have no right to occupy this country then the English people have no right to occupy India, and it is perfectly justifiable on our part to kill an Englishman who is polluting our sacred land.

"I wish that the English people would sentence me to death, for in that case the vengeance of my countrymen will be all the keener. I put forward this statement to show the justice of my cause to the outside world, especially to our sympathizers in America and Germany."

The Retirement of Prince Bülow

The financial bills which caused the resignation of Chancellor von Bülow and have occupied the attention of the Reichstag for the past eight months were voted on July 10. Very little is left of the Government's proposals as originally presented, for the coalition of the Conservatives and Clericals took the matter in their own hands and prepared a series of revenue measures quite regardless of the wishes of the Chancellor. The budget as passed is expected by its advocates to bring in additional revenue of \$125,000,000 a year. The inheritance tax on which Prince Bülow insisted was entirely omitted from the bill. The tax on the unearned increment in land values, which is a prominent feature of the pending British bill is postponed for two years, at which date a bill for that purpose is required to be introduced. A new stamp tax is imposed on checks, stubs for the renewal of dividends, and coupon sheets, and the stamp tax for the issue of

new stocks and bonds is raised. The duty on tea is quadrupled and is raised on coffee, effervescent wines and cordials. Beer, tobacco and brandy will bear heavier taxation. All the radical parties in the Reichstag voted against the bill. Prince Bülow was not present when the bill was passed, but the Government was represented by the Vice-Chancellor, Dr. von Bethmann-Hollweg, Secretary of the Imperial Home Office, who said that the financial bill as amended would be accepted by the Government only because of the immediate necessity of putting the finances of the empire in order, so that national business could be carried on out of the revenues rather than by promises on the future. Dr. Von Heydebrand, leader of the Conservatives, expressed his regret at the retirement of the Chancellor and denied that the action of his party was taken with that in view. The Emperor is consulting his friends as to the choice of a new Chancellor. Prince Bülow has recommended as his successor the present Vice-Chancellor.

The March to Teheran

The vacillating policy of the Shah has brought chaos upon Persia. Three armies, two revolutionary and one Russian, are now marching against the capital, and he has no troops on whom he can rely and no money to procure them. He has signed the new electoral law, but it is not yet promulgated and his ministers are so divided as not to appoint them. The Bakhtiari tribesmen in their march from the south were led by Sardar Asad, who declared his intention of entering Teheran to see that the constitution was put into effect. He was met at Kurm by the Russian and British Consuls-General from Ispahan, who endeavored to persuade him to abandon his plan, as the Shah had, under pressure from the Russian and British Governments, re-established the constitution and called for a legislative assembly and that if a revolutionary force should attack the capital it would destroy all hopes of popular government. Sardar Asad declared that the people no longer trusted the Shah and proposed to take matters into their own hands henceforth. The Consuls General then formally warned him that a persistence in his course would necessitate foreign intervention.

In spite of this ultimatum he continued his advance and a few miles from Teheran came into conjunction with another band of constitutionists marching from Kazvin under Sitahdar Je. The object of the revolutionists is presumably to dethrone the Shah and prevent the country from falling into the hands of the Russians. The only protection of the capital against the armed bands investing it or the disorderly element within it is a small force of Russian and Persian Cossacks under a Russian officer, General Liakhoff, and it is uncertain which side these would take in an emergency. On this account a considerable force of Russian troops have been dispatched from Baku to occupy the capital. They landed at Enzeli, the seaport of Resht, 180 miles northwest of Teheran.

The Dutch Election

The elections held on June 11 and 25 for members of the Dutch Lower House resulted in a victory for the Clerical Right. The Socialists lost a few seats and the Liberals more. This result is due chiefly to the superior organization and harmony of the Clerical parties. There are three of these, first and largest, the Catholics; second, the Anti-Revolutionary party, composed of Calvinists, the third, the Historical Christian party. The last is the aristocratic group of moderate reform, joining with the Clericals out of fear of the Socialists. This also is the leading principle of the Anti-Revolutionary party, which was organized by Dr. Abraham Kuyper, for opposing what he considers a revolutionary movement for the destruction of all religion and society. This party is the only one that has gained much in the elections, and will have at least 20 seats in the new Chamber. The Clerical coalition as a whole will hold about 60 seats out of the 100. It is probable that there will be no change in the administration for the present. Premier Heemskerk is a member of the Right altho he succeeded Dr. Kuyper in 1895, when a Liberal movement deposed the latter of power on account of his rigid ecclesiastical views. The Heemskerk Government, while following the same general policy, has been

somewhat moderate and conciliatory. The Radicals in the recent election were divided and wasted their strength fighting each other, in some precincts there being four or five candidates of the Left, ranging from Liberal to extreme Socialist. The main object of the Left has been universal suffrage, which is now likely to be postponed indefinitely, altho the Anti-Revolutionary party favors giving a vote to the head of every family. All parties are pledged to do something for old-age pensions or insurance, the Anti-Revolutionary party favoring compulsory State-aided insurance. This and the Catholic party advocate a higher tariff in order to diminish direct taxation. This involves a question of international politics, for if Holland ceases to be virtually a free trade country, it will interfere with German commerce by way of Rotterdam. Now that the Queen of the Netherlands has an heir, the people have less dread of future absorption by Germany.

✱

Spanish Morocco

The weakening of the power of the reigning Sultan of Morocco has permitted disorders to arise in various parts of the country which bring about conflicts between the natives and the European Powers interested in Morocco. The Riff coast, on the Mediterranean, west of Gibraltar, which is Spain's sphere of influence, is now the scene of conflict, due to the attempts of fanatical natives to stop railroad construction. Spanish workmen on the railroad near Melilla were recently attacked by 4,000 Moors and four Spaniards were killed. The Governor of Melilla dispatched a military force to the spot and dispersed the Moors after a sharp conflict, in which one Spanish officer and seven soldiers were killed and others wounded. A cruiser and a transport have been sent from Spain with six battalions of infantry, three batteries of artillery, and a squadron of cavalry, and other reinforcements will follow. An embassy from Morocco was, at the time of the outbreak, in Spain negotiating for the settlement of the questions in dispute between the two countries. The result of the affair will be probably the extension of Spanish power in Morocco, and the coast from Melilla to Ceuta will be occupied by Spanish troops.

State vs. University Controversy in Germany The appointment of Dr. Mahling, of Frankfurt-a-M., an efficient man in practical church work, but entirely inexperienced in academic life, to the leading chair of practical theology in Germany, that in Berlin, as the prospective successor of the veteran and venerable Kleinert, and doing this against the wishes of the theological faculty itself, is bringing into an acute state the tension that has been growing between the state authorities and the university faculties, particularly the theological for years, and this appointment has led to a vigorous debate in the Reichstag. At bottom there is a deep-seated difference of principle at stake. The university men insist that only the scientific prominence of a man and his scholastic attainments shall make a man an acceptable candidate for a university professorship, no matter what his theological doctrinal position may be, conservative or advanced; on the other hand, the government insists that the so-called Parity Principle (*Paritätsprinzip*), according to which representatives of both schools of theology shall hold chairs in the leading theological branches, shall be enforced and that now in the case of Mahling a conservative has a right to appointment, even if his literary activity has not been exceptionally prominent, since the last appointment to a Berlin professorship of theology was that of the advanced Dr. Deissmann, of Heidelberg, as the prospective occupant of the chair of Bernhard Weiss. The "Mahling" case is being discussed by the entire press of the Fatherland and all are taking sides. The University men fear for those greatest principles of academic life, the great *Wissenschaftlichkeit* and the *Lehrfreiheit* at the famous institution, if men are to be appointed merely or chiefly for their doctrinal positions; while the rank and file of the church, which is largely conservative, insist that the theological chairs shall not be regarded as the booty of the radicals, and the government is trying hard to satisfy both parties, but seemingly is unsuccessful, especially as it does not consistently adhere to its "parity principle," e. g., the theological faculty in Greifswald being without any representative of liberal theology at all.

The Hudson-Fulton Celebration of 1909

BY GENERAL JAMES GRANT WILSON

First Prize, 1909, Hudson-Fulton Celebration, New York

TO the citizens of the metropolis of the New World, as well as those of the most important and populous State of our Union, the event of greatest interest in the history of American discovery next to that of the continent itself by "the world-seedling Genoese," is the discovery of New York Bay and the exploration of the Hudson River. Indeed, apart from its local interest, the story of Henry Hudson's voyage in the "Half Moon" is so full of romantic interest that we never weary of its repetition, but turn to it with ever-enduring pleasure. Yet historical exactness compels us to ask: Was the English captain the first of European navigators to gaze upon the beautiful prospect of our peerless lower bay and river, of forest-covered Manhattan, and the noble Palisades? All can heartily sympathize with Washington Irving's sentiments when, express-

ing his indignation against those writers who sought to deprive Columbus of the great glory of his discovery, he said: "There is a certain meddlesome spirit which in the garb of learned research goes prying about the traces of history, casting down its monuments and marring and mutilating its fairest trophies."

Although there is ample evidence for believing that Hudson was preceded in the discovery of the river that bears his name by Giovanni de Verrazano, an Italian, at the time (1524) in the service of France, and

also, a year later, by Esteban Gomez, a native of Cadiz, sailing under the flag of Spain, also that Captain Hudson was not entirely ignorant of the existence of the river it is supposed he was looked upon as the original explorer three centuries ago, still we may cling with considerable reason to the impressions of our ancestors. And altho it is even possible that the

Scandinavians, and other ancient navigators may have seen the beautiful bay and river before Saxon Harold fell at Hastings, the discovery of Henry Hudson possesses over all the other who

of its occurrence to the present day: of bearing fruit immediately in trading voyages begun the very next year; in temporary settlements upon the banks of the magnificent river within five years

OFFICIAL POSTER OF THE COMMISSION

may have caught a glimpse of their waters the unquestioned advantage of having been carefully made and circumstantially reported; also of having never been lost sight of from the date

after it had thus become known to the world, and, finally, in regular colonization and permanent occupation by a civilized people through a period of three centuries. It will therefore never lose

its historical importance and honor we shall ever be justified in regarding with deepest interest the arrival of Hudson and the "Half Moon" in September, 1609.

It is a curious circumstance that the place and date of birth of Columbus and Hudson are unknown. While Genoa claims the former as her son and London the latter, neither city possesses any evidence to prove the truth of their claims. The Englishman belonged to a family that counted among its members another Henry Hudson, believed to be his grandfather, who was an alderman of London, and, with Sebastian Cabot, among the founders of the Muscovy or Russian Company, which was intended to promote the discovery of a northerly passage to China. From its establishment in 1555 till 1607, when our explorer first appeared upon the scene as a captain in its service, several other Hudsons were prominent in the councils of the company, or engaged in its explorations. Educated in the company's service and familiar with its aims, Henry Hudson was entirely devoted to the problem of a northerly passage to China, and the various discoveries that he made were the outcome of this original idea. Of his

plate engraving.

four voyages of which anything is known, the first two were made for the Muscovy Company, and the third for the Dutch East India Company, he having accepted a commission to command an expedition in search of a northeast passage. An existing copy of the contract shows that he signed his name Henry Hudson, and that in the body of the instrument he was also named Henry, also that an interpreter was

required, as he did not understand Dutch. *For passage, may I be permitted to protest against his being called "Hendrick," as if he were a Dutchman, whereas he could neither read, speak nor write their language?* Again baffled by the severity of the Arctic season and fields of ice, as on his two previous voyages, Hudson sailed for the coast of America. On Wednesday, September 2, 1609, at five o'clock in the afternoon, the "Half Moon" cast anchor in a "great lake of water, as we should judge it to be." Hudson had found the Lower Bay, and later ascended the river to Albany.

Not long after, in June, 1611, the explorer closed a life of heroic adventure amid the very regions that had tempted him so often to daring endeavor.

CLERMONT, THE FIRST STEAMSHIP, BY ROBERT FULTON, 1807.
A reproduction of the ship will be a feature in the Hudson-Fulton celebration.

ors. The manner of his death was barbarous, being set adrift with his son by the mutinous crew in an open boat, amid the ice fields of Hudson's Bay, as seen in Hon. John Collier's painting, yet it was not perhaps an inappropriate close to a career such as his, and in this respect resembled that of the Dutch Arctic navigator Barentson, whose exploits doubtless contributed to arouse Hudson's ambition. In the words of Bancroft: "What became of Hudson? Did he die miserably of starvation? Did he reach land to perish from the fury of the natives? Was he crushed between ribs of ice? The returning ship encountered storms, by which, it is probable, Hudson was overwhelmed. Alone, of all the great navigators of that date, he lies buried in America; the gloomy waste of waters which bears his name is his tomb and his monument."

As in the case of Henry Hudson and the earlier discoverers of the river that bears his name, so it was with the American artist and inventor, Robert Fulton (1765-1815), and the introduction of steam applied to navigation. The priority of the experiments made by Fitch, Rumsey, Roosevelt and Stevens does not deprive Fulton of the distinction and glory which is popularly and properly accorded to him as "The Father of American Steamboating." The poet Halleck told me that as a youth on his first visit to New York in August, 1807, he saw the departure of the "Clermont" on her pioneer trip to Albany, standing among the thousands of spectators who cheered the steamboat as she left the wharf near the foot of Tenth street. Five years later Halleck paid fourteen dollars for a ticket to Albany and return, in Fulton's third and greatly enlarged and improved steamer known as the "Paragon." In 1815 Halleck, who had become acquainted with Fulton, saw him placed in the Livingston vault in Trinity Churchyard in the presence of a larger number of national, State, and city officials than had ever before been assembled at a New York funeral.

During the winter of 1904-5, the late Robert B. Roosevelt, uncle of the ex-President and African hunter, invited a score or more prominent gentlemen of New York to meet at his Fifth avenue home for the purpose of considering the

propriety of celebrating the ter-centenary of the discovery of the Hudson River. About the same time another group of influential New Yorkers met together with a view to organizing for the object of commemorating the introduction of steam navigation in 1807 on the same river. Ultimately it was wisely decided to combine the two movements and hold the united celebration in September, 1909. In accordance with this plan the Hudson-Fulton Celebration Commission was appointed by the then Governor of the State and the present Mayor of the City of New York. The commission to arrange for the "Commemoration of the Ter-Centenary of the Discovery of the Hudson River in the Year 1609, and of the first use of steam in the navigation

THE "HALF MOON."

Which will be reproduced for the Hudson-Fulton celebration. From an old print

of said river by Robert Fulton in the year 1807," was permanently organized December 5, 1905, being incorporated by Chapter 325 of the Laws of 1906 of the State of New York. Its board of trustees, who give their services, have held monthly as well as special meetings for more than three years, and prepared the following program, which is, of course, subject to changes and modifications in details.

Saturday, September 25, and Sunday, September 26, 1909, are set apart as Religious Service Days for those who are accustomed to worship on Saturday and Sunday. On the afternoon of Saturday the formal reception of foreign and United States naval vessels will take

THE STATE ARRIVING OFF MANHATTAN ISLAND, SEPTEMBER 11, 1609.

place. The "Half Moon" and "Clermont" will also pass up the Hudson, anchoring off Riverside Park, south of Grant's Tomb, where an evening reception and pageant will be given. An interesting incident of the celebration may properly be mentioned. The people of the Netherlands, under royal auspices, are constructing an exact reproduction of Hudson's ship to be presented to the commission, manned by a crew in the Dutch costumes of 1609, while a faithful facsimile of Fulton's steamboat is being built in New York.

Monday, September 27, the "Half Moon" and "Clermont" to take position in line of American and foreign naval vessels.

Distinguished guests to disembark and be officially received.

General decoration of public and private dwellings from New York to the head of the Hudson River.

Opening of exhibits of paintings, engravings, books, models, medals, antiques, relics, etc., by the Metropolitan Museum of Art, the American Museum of Natural History, the New York Public Library, the Hispanic Museum, the New York Historical Society, the American Geographical Society and similar in-

stitutions thruout the State. The exhibitions in some of the above institutions are expected to be the most interesting ever seen in this country.

On Monday, or some succeeding day, there will be a remarkable display of flying machines and a prize of *ten thousand dollars* will be awarded to the aeronaut who, with a mechanically propelled airship, sails over the course from New York to Albany, traversed by the "Clermont" a century ago, in advance of his competitors.

Tuesday, September 28, Historical Parade in the City of New York. The procession will consist of floats and tableaux representing the principal events in the history of the city and State for three hundred years. This parade is expected to be repeated on a later day in Brooklyn.

In the evening, at 8 o'clock, the official literary exercises will be held in the Metropolitan Opera House and in the new Brooklyn Academy of Music, in which orations will be delivered by the President of the United States, the Ambassador from Great Britain, the Minister from the Netherlands, the Governor of New York, the Mayor of the city, and other gentlemen of national reputation.

Wednesday, September 29, will be devoted to the dedication of memorials and parks along the Hudson River and to general commemorative exercises thru-

voked to participate in like manner by establishing parks or other public memorials. The commission is informed that monuments to Henry Hudson and Wil-

HUDSON'S LAST VOYAGE

From the painting by Hon. John Collier in the Tate Gallery, London.

out the State. It is expected that Inwood Hill Park and Verplanck's Point will be acquired in season to be dedicated, also that the civic pride of various communities along the Hudson will be in-

flamed the Silent, and tablets to the Founders and Patriots of New York on Fort Tryon will be ready for dedication. Commemorative exercises will be held thruout the whole State, and in this city

by Columbia University, New York University, College of the City of New York and various other educational and historical societies of New York and Brooklyn.

Other features of Wednesday's program will include aquatic sports on the Hudson River designed chiefly for friendly competition between the crews of the foreign and American naval vessels which can be seen from Riverside Park, also motor boat races and such other contests as may be desirable, both at New York and Yonkers; a reception to distinguished visitors from abroad at West Point during the day, and in the evening an official banquet.

Thursday, September 30, the great military parade will take place. It is expected that not less than 25,000 troops will participate, consisting only of the United States Army, the United States Navy and Marine Corps, the New York National Guard and the Naval Militia, with the Cadets from West Point and the Naval Academy. An evening reception for the official guests at the headquarters of the Department of the East, on Governor's Island, is suggested as the closing event of the day.

Friday, October 1, is appointed for the interesting naval parade, when it is expected that more than a score of splendid warships will convoy the "Half Moon" and "Clermont" up the Hudson as far as Newburgh. Simultaneously with the advance of the South Hudson Division a counter procession of smaller naval vessels will leave Albany for Newburgh, the two divisions meeting and holding appropriate ceremonies. Here the "Half Moon" and "Clermont" will be transferred, and on Saturday be conveyed to Albany by the North Hudson Division, the other division returning to New York.

Saturday, October 2, is designed for a general carnival day in New York City and thruout the State, it will be peculiarly the children's day. The celebration will conclude in the city with an evening carnival parade, which is expected to exceed in beauty and interest anything of this character ever seen in the Old World or the New. The carnival parade, it is proposed by the commission, shall be repeated in Brooklyn during the following week. Brilliancy will be added to the general spectacle by the illumination of the fleet, as well as of public and private buildings, and a grand pyrotechnic display. At 9 p. m. it is designed to have a chain of signal fires from mountain tops and other eligible points along the Hudson from New York to Troy lighted simultaneously.

Beginning with Sunday, October 3, a week will be devoted to celebrations in the cities and chief towns of the Upper Hudson, at which the North Hudson Fleet with the "Half Moon" and "Clermont" will anchor, arriving at Troy on Saturday, and concluding the two weeks' Hudson-Fulton Celebration.

The historical pageants which were so much admired at the Philadelphia and Quebec celebrations of last year, and during the past two decades in different countries of Europe, will be a prominent feature of the New York City program. They will doubtless prove to be among the most attractive features of the celebration. The pageants will be seen during the first week upon a great float anchored nearly opposite the Soldiers and Sailors Monument, in Riverside Park. An Indian village will be reproduced, in and around which interesting incidents and scenes connected with the early history of the metropolis will be faithfully represented.

NEW YORK CITY

Rudyard Kipling

BY F. H. G.

WITH AN INTRODUCTION BY RALPH WALTON TRENKLE

He is the Dinger and the Ding,
He is the Dinger and the Dong,
He is the Thumper of the Thing,
And he the Thing that Thumps a Long.

The Federation of Europe

BY SALVATORE CORTESI

THE Eternal City has just inaugurated the first Congress for the Federation of Europe, thus intended to give peace and good will to the peoples of the ancient Continent.

The Congress was promoted by Sir Max Waechter, of England, whose devoted work toward this object is well known and appreciated, and was organized by a committee, headed by

Prince Orazio di Cassano - Zunica.

The name of the latter is by itself a sufficient earnest of the work and object to be reached. Altho descended from one of the most ancient and noble families of Italy, he has expended a good deal of his activity in journalism and in taking part in congresses and conferences on comparative law, statistics, agriculture, international law, etc. He has been present at 219 of the latter, participating in their discussions and presenting interesting reports, spending nearly 200

days each year traveling and in 1892 alone crossing the Channel 126 times. He is one of those versatile intelligences which have expanded in almost all directions, so that, while he has built a house to resist any earthquake shock, he has led peasants' strikes to defend their rights against the usury of the proprietors. He began life as a brilliant cavalry officer and is now "Peaceologist"—a word coined in Paris.

This is the more remarkable because his family has descended from the cadet branch of the King of Navarre, which, after having defeated the Moors in Spain, came to fight in Italy under Charles V.

Prince Cassano's idea, which predominated thruout the Congress, is to accomplish the Federation of Europe, not thru

utopian projects, but by uniting the different nations in all those interests which are common to themselves.

Of course, there is nothing new under the sun, and the idea of federation is as old as humanity itself. We have mention of it in Tacitus and Herodotus and in the history of the wars of Alexander and Cæsar. The Crusades were an example of this principle applied to the military forces of different countries in the Middle Ages, and can be compared to the action of the European Powers in China when they all sent contingents

under Marshal von Waldersee, or when the fleets of the European countries made a naval demonstration in Greek waters under the command of the Italian Admiral Canevaro, or when England, Russia, France and Italy collectively occupied Crete, or, finally, when all the different European States contributed to form the International Macedonian Gendarmerie under the command, first of General De Giorgis, and then of General

PRINCE DI CASSANO-ZUNICA,
President of the Congress of Rome for the Federation of Europe.

Robilant. These federations, however, were in the history of the world momentary and restricted to a certain object. The Papacy often dreamed of the union of all the peoples of the globe under a unique authority, and Victor Hugo expressed the same view when he said: "I would be a citizen of the United States of Europe while waiting to be a citizen of the United States of the World." Among the practical examples of federation, aside from the United States of America and the German Empire, Switzerland is the most interesting because it comprises three races of absolutely distinct nationalities, which have been for centuries antagonistic, fighting for supremacy, and even now these races outside of the republic are waiting the moment for a decisive struggle.

There is no one acquainted with European affairs and feelings who does not understand that what has been possible for Switzerland to accomplish is absolutely unrealizable if an attempt were made to apply it to the whole Continent. There is, therefore, no question of an immediate European Federation from the point of view of a political union of the different states. The efforts of the Congress and of all lovers of peace, however, aimed to facilitate in every possible way international agreements and conventions in the fields of commerce, labor and law. The best example of this tendency of the human mind toward extending the borders of the community is perhaps given by Italy, where, in the Middle Ages, we find the country divided into communes, almost each village being a state in itself and some small towns such as Pisa and Amalfi acquiring the position and the strength that in our days are enjoyed by the Great Powers. Later these communes joined into regions dividing the Peninsula and its main islands into several states until finally the idea and the feeling of nationality unified the whole country. Why should this process not extend, passing from the nationality to the race so as to unify in Europe all the Latins, next all the Teutons, next all the Slavs, all the Scandinavians, and all the British? Once this step is accomplished it will be easier to pass from the federation of the races to the federation of the Continent.

A European Zollverein has been sug-

gested, thinking that a unification of duties and tariffs would be the best means to approach the union on other points. This was also the opinion of Sir Max Waechter, but the Congress of Rome has not supported such a proposition, realizing that the conditions of industry and trade are far from being ripe for a reform of this kind. Indeed, this desire for protection is not only strong between state and state but even between town and town, which thru local duties try to prevent the incoming of outside cheaper wares which would kill the home produce. Thus we see for instance Venice raising the *octroi* on furniture in order to protect the traditional Venetian hand-made wooden goods against the machine imitation from Milan. Other proposals which the Congress of Rome did not consider practical for the moment were those suggesting that the whole of Europe should have only one Minister of Foreign Affairs and only one Minister of War and Navy. The differences, jealousies, ambitions existing among the states of Europe are too well known to need any explanation why anything of the kind is for the moment absolutely out of the question. No one, in fact, can possibly imagine England giving the supreme command of her navy to a German admiral or Germany allowing her army to be headed by a French general, or Austria entrusting her foreign policy to a Russian statesman.

The Conference, therefore, took the only practical methods—namely, those of strengthening and multiplying the agreements among the different states on questions common to all. First come the agreements and conventions concluded at the two Hague Peace Conferences, which will lead the way to more important and more extended understandings at the next Peace Conference of 1915. Before and after the Hague there have been a series of international connections which, according to the opinions expressed in the recent Congress of Rome, should lead to the much desired European federation, and then to a greater one embracing the whole civilized world. In the same way that it has been possible to establish the Universal Postal Union, sitting at Berne, the International Telegraph Convention of St. Petersburg, the International Institute of Agriculture in

Rome, the International Colonial Institute at The Hague, the International Accord for the Protection of Authors' Rights, the International Sugar Convention of Brussels, the Latin League, ensuring the same coinage to France, Belgium, Switzerland, Italy and Greece with free circulation, and several scores more of the same type, not to mention the Red Cross, many others might be concluded, thus gradually reaching a point when there would be no question on land or sea over which two or more countries could possibly fight, as for every difference there would be laws already agreed upon and courts to apply them.

Among the suggestions made for new international agreements there are a coinage common to all, a unification of weights and measures, the adoption of an international postage stamp, a uniform telegraph rate, the acceptance of the same laws to protect laborers both with regard to the amount and kind of work and with regard to wages, the mutual

recognition of university degrees, and so on.

Thus a movement has been started receiving the support of public opinion in the most enlightened circles of the Old Continent, which nothing will be able to stop, and altho difficulties of all kinds will have to be overcome, due to habits, traditions and atavic dispositions, it is destined to triumph in the end. Of course it is very difficult to make predictions, but the most fairminded supporters of these ideas believe that the twentieth century will not expire without seeing under one form or another a kind of federation or confederation of Europe, brought together for peaceful purposes, and not, as some people think, under the pressure of the American Peril on one side, or the Yellow Peril on the other. By that time, it is thought, the education of the peoples will be such as to render armed conflicts impossible, compelling the various opposing claims to be submitted to and decided by impartial courts.

ROME, ITALY.

Clyde Fitch: A Critical Appreciation

BY MARTIN BIRNBAUM

[Mr. Birnbaum is a native of Hungary, educated at the College of the City of New York, and has always been a student of music, art and letters.—EDITOR.]

CAPTAIN WILLIAM G. FITCH, the father of the playwright, always hoped that his only son, William Clyde, would become an architect. But at Holderness School in New Hampshire, and later at Amherst College, the young fellow neglected Euclid and Brunelleschi for his editorial venture, *The Thunderbolt*, and his marionettes, puppet shows and amateur theatricals. The captain was alarmed at the bent of his son's mind, and it was only after persistent persuasion that he consented to allow him to start on a literary career.

Young Fitch settled in New York City and led a picturesque existence, but his "Sturm und Drang" period was a comparatively mild one. The privations he suffered were not the distressing ones

usually incident to the commencement of an artistic career. To go to the theater night after night, and sit, like Charles Lamb, before the green curtain that veiled a heaven to his imagination, to watch the passing pageant, to be carried into a world of fantasy, soon became an absolute necessity. He could not afford to frequent the parquet, buy antiques and yield to luxurious tastes in matters of dress at the same time. Fabulous royalties did not flow into Fitch's wonderful studio at the old Sherwood in those days, and when a coveted tapestry or a pink marble font was put up for sale his valet had to be consulted before it could be secured. Unfortunately Antoine's salary had already been paid or became due precisely when one of these treasures was discovered, and it was no

easy matter to convince the valet of the advisability of lending his wages, even upon compound rates of interest, to his enthusiastic young master.

Fitch was then, as he is now, a very

CLYDE FITCH.

After an unpublished drawing by Gordon Grant.

distinct personality. He surrounded himself with a sympathetic *entourage*, to which he remains a boy who wouldn't grow up—like Peter Pan. He loves children, knows how to handle them, reason with and reward them, and at the rehearsals of works like "Her Own Way" or "The Girl Who Has Everything" he succeeds in making little artists of them. His houses are charmingly decorated with marble cherubim and Della Robbia bambini; fascinating little winged figures support shields and garlands on the terraces; his beautiful garden boasts of a lovely temple to Cupid; the happy dancing and singing children of Donatello and other artists of the Italian schools smile down at the visitor from lunets and niches in the walls; even his dinner table is adorned with exquisite angels of Capo di Monte porcelain, and his first book, "The Knighting of the Twins," which

was published in 1891, is a collection of stories for children and unsophisticated grown-ups. It is in this modest volume, with its sweet and tender fancies, that we find the real Clyde Fitch. His only novel, "A Wave of Life," appeared in *Lippincott's Magazine* during the same year. This book, as is often the case with early literary attempts, is to a certain extent autobiographical. But in the novel, which is a crude, immature work, he wears a mask, whereas "The Knighting of the Twins" has behind it the charm of his delightfully original and evasive personality. While trying to earn an independent livelihood, he also tutored children, gave subscription Browning readings, contributed jokes to funny papers and verses to magazines. Finally he wrote a one-act comedy of college life entitled "Betty's Finish," which was produced with some success by the old Boston Museum Company on December 29th, 1890. His real career as a dramatist, however, may be said to begin with "Beau Brummel," the play which he wrote for the late Richard Mansfield.

In 1890, Mr. Edward A. Dithmar, formerly dramatic editor of the *New York Times*, a common friend of the two artists, on learning that Mansfield was anxious to appear in a play dealing with the life and times of the famous Beau, introduced the men to each other, and the meeting resulted in a commission for Fitch. He was entirely in sympathy with the subject, being an elegant young dandy himself, only, as his inimitable friend, Max Beerbohm, would say, a dandy anxious to follow a less arduous calling. The first performance took place at the Madison Square Theater on May 19th, 1891. Fitch was only twenty-six years old at the time. It achieved a noisy triumph, ran thru the summer for over a hundred nights, and always remained the most popular play in Mansfield's repertoire. It must, of course, be conceded that Mansfield exercised the very important privileges and powers of a supervising actor-manager, but the responsibility of the work rested on Fitch's shoulders, and any one familiar with his later plays can recognize thruout the rudimentary earmarks of Fitch's work.

He now felt justified in abandoning all other forms of literary endeavor, and

henceforth he devotes his energies and remarkable activity to playwriting. As might be expected, he yielded to the temptation to produce a number of plays similar in style and treatment to his first success. He also translated and adapted a large number of plays of the French and German playwrights, dramatized novels, and collaborated with other men. The best of these plays are not merely dry translations or slavish imitations of foreign works. Fitch remodels the figures, endows them with new life, transforms foreign characters into genuine American types, and is often entitled to the credit of original creation. This work gradually improved his technique, the immaturity of his manner disappeared, he became a master of stagecraft, and a writer of simple, fluent dialog. Much of it is acknowledged to be poor, flimsy hack work, to some of which he never signed his name, but if it is urged against him that a serious playwright would have employed his talents to more artistic purposes, he might reply as Sheridan once did when rebuked with the same charge, in Dr. Johnson's couplet:

"The drama's laws, the drama's patrons give,
And those who live to please, must please to live."

If the critic suggests that the favorable opinion of his audiences has meant too much money in the playwright's pocket, Fitch, who is above all things a typical American in spirit and a child of his age, smiles blandly and complacently admits it. He is not forced to affect the fastidious superiority of those men who appeal to a small group of people. Financial success undoubtedly gives him keen pleasure. It means Gobelin tapestries, paintings by Boucher, Natier and Mignard on his walls; rare and carefully selected books on the shelves of an intensely interesting library, especially rich in memoirs and personalia—for his great passion is the study of human nature; it means a country place saturated with the atmosphere of Italy, and fine gardens, where he satisfies a love of nature which has been intensified by town life; it means automobiles, annual trips to the unknown corners of Europe and a thousand other long wished for things, but it does not necessarily mean a debasement of ideals. No one who has heard Fitch

speak with passionate earnestness of his work, in that convinced but not flagrantly egoistic way of his, will doubt his sincerity, and it is to his credit that on studying his artistic evolution we find him doing his most serious work after he has won his public, when his contemporary fame is established, and the Fitch play has become a byword in theatrical parlance for amazing industry, bewildering theatrical device and dexterity.

In his early original plays such as "A Modern Match," "The Moth and the Flame" and "Lover's Lane," Fitch used many old-fashioned dramatic conventions, but there is already a well-defined promise of finer work. He abandoned hackneyed stage phrases, filled his work

MR. FITCH

From the "Chap Book," Copyright 1914 by Stuart & Kimball, Duffield & Company, Inc.

with technical innovations and touches of realism, gave evidences of keen insight into human motives and emotions, and of a remarkable instinct to chronicle the minutest details and circumstances of the life he saw around him.

While still trying his wings he had time to amuse himself by writing imaginary dialogs and short satires in the shape of letters, some of which appeared

first in the lamented "Chap Book," and were subsequently included in two entertaining little volumes entitled "The Smart Set" and "Some Correspondence and Six Conversations." These two books are in Fitch's latest manner. The dialog thruout preserves a fine colloquial air which has always been the despair of his rivals. His touch is sure, his characterization precise and admirable. He writes with an apparent speed which gains for his letters and conversations a spontaneity, freedom and liveliness rarely present in deliberate composition, and when we have finished these books we are not unprepared for "The Climbers," which effaced the memory of his early transgressions, and marks a step in Fitch's advance to his present position in the field of dramatic literature.

"The Climbers" opens with a scene which is distinctly Fitch's. To start a play with a party of women returning from a funeral was so daring that it was with difficulty that a manager could be found willing to put it on the boards. Since its very successful production, however, in 1901, his audiences invariably expect some example of this bold pictorial originality. He rarely disappoints them, for his power of invention seems unlimited. At times he allows himself to be too amusing. He hesitates at nothing and occasionally goes beyond the verge of daring. His first nights have an air of gaiety, of delightful expectation. We never know what may or may not happen on those festive evenings. In "The Way of the World" (a title which had been used by Congreve for one of his masterpieces) we were guests at a baby's sensational christening; in "The Stubbornness of Geraldine" we were on the wave-tossed deck of an ocean liner; in "The Girl with the Green Eyes" we were shown the Apollo Belvedere, surrounded by a group of peppermint-eating Cook's tourists; in "The Girl and the Judge" there was the famous folding-bed scene; "The Cowboy and the Lady" had the mirth-provoking cure for cursing; "Her Great Match," the convenient lovers' corner, moonlit at will, and so on thru the long list of plays. These are, after all, only samples of his admirable stagecraft, clever and effective devices for catching the attention of the public,

but Fitch does not always stop there. The opening scene of "The Climbers," for instance, is a sharp satire on the insincerity and heartlessness of certain shallow types represented by Mrs. Hunter and her daughter Clara. Fitch's dialog, frequently epigrammatic, has here an unique flavor. The figures are etched with a caricaturist's fine unerring instinct for the important details, and a clear, full outline. All have the modern sparkle. Fitch seizes the salient features, fastens on particulars, knows what to ignore and what to exaggerate. The deck of the Atlantic liner on which Geraldine returns to America is filled with an immensely entertaining crowd of sea-sick voyagers, each one an admirable portrait, drawn in a masterly fashion with the fewest possible strokes. The stage vibrates with life. Everything moves with a splendid dash. The whole scene is so startlingly original and animated that it creates an enthusiasm which blinds one to the fact that very little of it is really necessary for the development of the play's rather obvious central idea.

Not infrequently we find the main situation interfered with by such scenes in order that his audience may be amused. In "Her Own Way," for instance, he is indifferent to the cause which brings the hair-dresser into the action, and many of her entertaining speeches are adroit interruptions of the narrative, unfortunately at critical points. Congreve, the great model for all writers of English comedy, often sins in the same way, hindering the progress of his play for the sake of introducing his brilliant, highly polished shafts of wit and sarcasm. The incidental sketches are often more interesting than the plays themselves. Fitch is too ready to agree with ever-youthful Laurence Sterne, who wrote, in "Tristram Shandy," that digressions are "the sunshine, the life, the soul of reading." But play writing is not novel writing, and the fault is a serious one, altho it is the outcome of an exuberant fancy and endless fund of ideas which are among his greatest virtues. While writing he cannot keep pace with the abundance of material with which his brain is teeming. He often puts astonishingly good things into parentheses, and sometimes whole new plays spring to the surface. On the

margins of the manuscript of "Her Own Way" there are already notes and hints for the scenes of that curiously constructed, baffling little play, of vagabond quality, entitled "Glad Of It."

In his latest work, however, Fitch has succeeded in avoiding this error of distracting the listener, and in the treatment of the plots of "Her Great Match," "The Woman in the Case" and "The Truth" he has made an advance on anything he has yet done. His powers are becoming more symmetrical, and the last-mentioned play is a fine example of his ability to invest a play with an air of reality and sincerity. He has learned that sound logic and straightforwardness are not incompatible with effective theatrical situations. The fact is that the level of his recent original work is unquestionably high. The metropolitan critics, however, with a few notable exceptions, treat him with scant respect, and are either purposely or hopelessly undiscerning. They dismiss him as a merely clever man tainted with commercialism, as a writer of ungrammatical English deformed with slang, and a creator of vulgar characters; or, they employ that barren kind of criticism which finds fault with a dramatist for not writing like some other man. We have already touched upon the first charge, and it is a simple matter to answer the second by pointing to the language of Molière, which is at times full of inaccuracies and defects. The language of the theater need not always be correct. Indeed an error of speech, a slang phrase or a colloquialism often breathes the breath of life into a character.

The charge of vulgarity is for the most part also the charge of stereotyped criticism. To arraign Fitch because some of his characters are not refined types but ordinary people is as unjust and absurd as it would be to impute to Dryden the obscenity of his. Even the gross passages in the plays of Congreve and Wycherly must not be judged too hastily. It is necessary to take into consideration the unrestrained license of the period and the then existing revolt against the restraints of Puritanism. That is what Lamb and Hazlitt did with exemplary tolerance. The obscene gallants and profligates, the loose, unblushing

women, the artificial characters of Congreve's "Way of the World" or Wycherly's "Country Wife," are what Fitch would call, "human documents," and it is his aim to give us equally faithful portraits of contemporary types. "I feel very strongly," said Fitch, in his lecture on the "Drama," delivered at Yale University, "the particular value—a value which, rightly or wrongly, I can't help feeling inestimable—of reflecting absolutely and truthfully the life and environment about us; every class, every kind, every emotion, every motive, every occupation, every business, every idleness."

Scheming lawyers, ruined brokers, shop girls, and elevator boys, petulant, jealous women, custom house officials, jail keepers, creatures of the "Tenderloin," physical culturists, matrimonially inclined English lords, honeymooning couples, bridesmaids, bridge-whist and bicycle fiends, tomboys, cowboys and nasal deacons, all find a place in Fitch's gallery. This is the sort of kaleidoscope Max Beerbohm was thinking of when he wrote that Fitch was a man who conceives mankind as a crowd of showy types. But besides having a theatrical value these figures have a certain genuine sociologic interest, and in them Fitch's technique and nimble wit find many excellent motives. He has been flattered by imitation and parody, but no one will deny that in these things he remains inimitable. His portraits often appear to be improvisations, but they are really based on a fine and serious technique, the more potent because it is unobtrusive. He notes familiar gestures, seizes vivid moments and fugitive details, brings out hidden weaknesses of average people with the rapid spirited, convincing notation of Arthur Schnitzler, the gifted Viennese playwright. It is a kind of snappy, artistic reportage, joined with fine flashes of insight. Unfortunately, the patience of selection often deserts him, where it means leaving out one of these humorous sketches from the scheme of a particular play, and it is not surprising that occasionally his customary taste fails him when searching the unexplored wealth of material around us. Fitch, however, does not countenance or condone the weaknesses of his

characters, nor does he give poignant expression in so-called problem plays to subjects never mentioned in polite society. He is a genial satirist, perhaps not sufficiently scathing or impertinent, whose

are absent from the work of a man who, in the consciousness of power, is tempted to undertake such tremendous artistic duties, and it is not difficult to find weak spots in his plays. The actual writing is

THE HOME OF MR. FITCH, AT GREENWICH, CONN.

irony, free from bitterness, has unjustly been mistaken for sympathy.

The serious, infinite pains which he takes with the minor branches of his work is further evidence of his artistic purpose. Like the late Victorien Sardou, he has acquired an intimate knowledge of all the secrets of modern stage mechanism and illusion, and he brings his knowledge to bear on every detail. Fitch looks after the entire *mise-en-scène*; the historical accuracy of all costumes, furniture, scenery and accessories; he arranges color schemes; he rehearses every minor rôle, and spends valuable time with upholsterers, dressmakers and scene painters; he even attends to the printing of programs, and not infrequently to the entr'acte music. All this because he considers himself responsible for the success or failure of his work in whole or in part. It is quite natural that academic niceties

done at fever heat, sometimes in his study, sometimes at rehearsals, often in moving trains, or even while listening to music, to which he is keenly devoted. His energies seem to be stimulated by the presence of human beings. While it is true that at times he overstrains his fertility, it is to be hoped that his frank touches, his spontaneity, the sprightliness and juvenile audacity of his apparently improvised scenes will not disappear, as the result of more painful execution. If only the "damned plots," which dear Elia could never find, and which he once whimsically threatened to omit altogether, would come to Fitch in less splendid profusion, it would perhaps be easier for him to restrain his youthful impetuosity. He knows that there is plenty of room for improvement, but new work has an irresistible fascination for him, and, instead of perfecting the old play, he de-

termines to improve upon it in the next. That is the secret of his comparatively slow evolution. The wonder of it all is, that his work in these incredibly busy years has reached such a high level, and that there is such an astonishing advance over the early plays.

Until quite recently, Fitch's plays existed only to be acted and not to be read. In this and many other respects there is a curious analogy between his work and that of Thomas Heywood, the most prolific playwright of the first half of the seventeenth century. The "prose Shakespeare," as Lamb in his pardonable enthusiasm called him, is said to have had a hand, "or at least a main finger," in nearly three hundred plays. In the prefaces to the comparatively few printed works he repeatedly proclaims himself faithful to the stage, and states that it never was his ambition to be "voluminously read." Heywood recognized the antagonism which exists between the literary and the dramatic, or, rather, theatrical, elements of his profession. If the publishers had been in the habit of printing his work shortly after its stage production, he would possibly have paid more attention to its enduring form and less to its mere theatricality. The same remarks are peculiarly applicable to Fitch, who is famous for his ability to direct and manage rehearsals, and it will be interesting to consider his future work from the strictly literary point of view, now that a uniform edition of his plays is being issued.

In one important particular many of the plays of Fitch and of other modern playwrights differ from those of Heywood and the other English dramatists. Today plays are generally written for stars, and these important personages try to force the playwright to subordinate everything to the display of their virtues. Fitch's ability to furnish excellent media for the exploitation of their peculiarities is indeed one of the reasons why they are so eager for new pieces from him. He is eminently happy in seizing upon the chief talents of an actress who is to be ushered into the existing galaxy. He balances and tunes the rôle to her ability with such fine skill that she immediately becomes established as an actress possessing rare insight and perfect technical skill. Even secondary char-

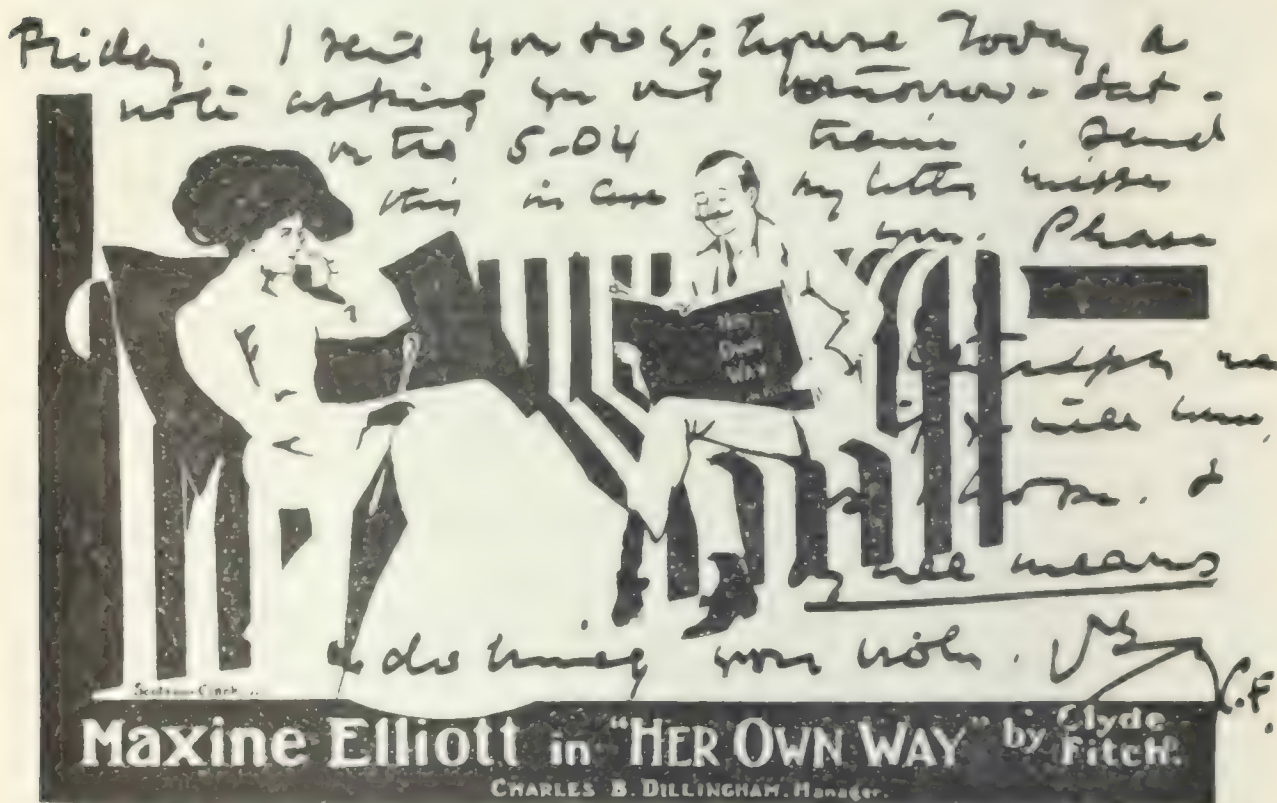

acters are often developed with particular actors in mind. It is, perhaps, not impossible to write a great drama in this way. The artistic dangers and pitfalls, however, are many, and they are well exemplified in that fantastic work, "Captain Jinks of the Horse Marines." That might have been a pure comedy of the superficial foibles and oddities of life in the bustle and waterfall period, centering around a prima donna; instead of which Fitch wrote a wayward, entertaining, intractable play for the display of Miss Ethel Barrymore's many charms, but something which it would be fruitless to attempt to classify as comedy, extravagant buffoonery, or very serious drama.

In his recent plays, however, the star's part no longer dominates every scene. In "Her Own Way," for instance, the so-called villain's part really outshines the leading rôle. The forceful, unscrupulous Sam Coast, ill-bred, vulgar in speech and deportment, but sincere in his deep passion for Georgiana, is contrasted with the girl's weak, irresolute brother. Fitch with great skill put a dash of something fine into the fiber of this ordinary bounder, and the figure is so real that he commands our respect in spite of the trickery to which he resorts in order to win the girl he loves. This is undeniably one of the finest studies on the American stage, and one of which any dramatist might justly feel proud. Another graphic type, splendidly delineated, is the Duke in "The Coronet of the Duchess." It is a portrait of consistent, indisputable vitality. The dextrous commingling of all the essential characteristics of a representative class of young Englishmen is a particularly notable achievement for the American dramatist.

Fitch's captivating studies of femininity are, if anything, even more remarkable. First, one thinks of Jinny, "The Girl with the Green Eyes," which John Corbin, one of our most discriminating critics, has described as "the most intimate, subtle and forcible character study yet seen in our drama." Then there is that exquisite embodiment of all that is adorable in American womanhood, Joe, in "Her Great Match." The atmosphere of many scenes in that charming poetical fantasy, its grace, lightness and refinement, its delicate strain of pure senti-

mental fragrance, deserve the highest praise. His latest and finest play, "The Truth," shows his power of penetrating psychological analysis. Hailed in Boston as the greatest play ever written by an American, and consequently damned with faint praise in New York, the success of

Mrs. Sterling to this woman, and then successfully appeals to her nobler instincts, imploring her to avert a tragedy and to forego a triumph over her rival! We also recall with special pleasure those charming normal American girls, the stubborn Geraldine, and Sylvia, "the girl

THE CLYDE FITCH PICTURE POSTAL CARD BY SCOTTEN CLARK

this play in all European countries was unique and inspiring. The theme of "The Truth" lends itself to the exhibition of his finest characteristics. Taken in connection with certain passages in his other recent work it shows that Fitch is now concerning himself with abstract ideas and the deep, final things of life, besides providing us with capital entertainment. On the other hand, as if to remind us of his wide range, he has written "The Woman in the Case," a melodrama in the best sense of that much abused term. This is one of Fitch's most vigorous and logical works, and the technique is as sustained as Pinero's at its best. Here we must also mention Miss Godesby, one of the Climbers, a subtle yet spirited portrayal of a nervously elegant woman, with a streak of vulgarity, the kind of type Fitch excels in rendering. What a fine scene is the one where Warden inadvertently reveals his secret love for

who has everything"; the sweet, homely, lovable woman, whose son wins the hand of the latter; the impossible Mrs. Carlev, a modern counterpart of Congreve's Lady Wishfort; and the estimable Grand Duchess of Hohenhetstein, a character charged with intense tenderness, who won our homage and drew tears, when Madame Cotrelly played the part. These are all studies of fine fidelity, drawn from every station and plane of life.

It would be very easy, by quoting from many other plays, to add to the above list and yet give no adequate idea of Fitch's talents and fertility. It is unnecessary, however. Surely we are justified in expecting something truly fine—at least, a great social satire—from a man who, while still young, and before his productive force has been fully spent, has achieved so many things which the critic's appetite of censure must exempt. Moreover, this brief notice of the man

and his work cannot from the nature of things be at all final, for Fitch is still in one of his transitional stages. He is always advancing and no longer in the old, rather circumambient way. Even his harshest critics will admit that he has succeeded in crowding his mass of work with many delicious scenes, and things of permanent value and abiding interest. It is true he has never realized a lofty, universal conception. He has, as yet, given us no play completely flawless or perfect-

ly rounded. He must still be judged in the bulk of his work and not by a single play. If, however, he will keep on overriding barren, captious criticism, and will not let his powers be crushed into extinction by it, if he will curb the impulse to start on a fresh track too often, and try faithfully and fearlessly to perfect his work, according to the high artistic standards and ideals which we believe are his, there can be but one result.

NEW YORK CITY.

Men We Are Watching

BY A WASHINGTON JOURNALIST

Senator Jonathan Prentiss Dolliver

IN discussing some of the schedules of the new tariff bill, during the extra session, debate in the Senate ran fast and furious. Some of the strong men of the Senate wholly forgot their pristine positions and dashed frantically upon their quondam leader, in defense of convictions antagonistic to the decreed course of events. Naturally they attracted wide attention—none more than Dolliver, of Iowa. He is a tremendous man, with a tremendous voice and tremendous energy. He is a quick thinker on his feet, a graceful—but especially forceful—speaker, with ready wit, omnific defiance, and a temper which does not always stand upon the order of its going.

Senator Dolliver knew all about tariff revision before it began, for he was on the Ways and Means Committee of the House when the Dingley tariff was fought out. So he was not alone in expecting to see the name of Dolliver fill one of the vacancies in the Senate Finance Committee—vacancies which were filled just before consideration of the present revision began. But it wasn't there, and Dolliver had to resort to the floor of the open Senate to ventilate his views upon some of the doubtful intricacies of the present bill. Whether right or wrong, he did it magnificently.

Senator Rayner, in one of his brilliant explosions, in the Senate, referred to

Dolliver's most extended effort in this way:

"The greatest act was that performed by the radiant nutcracker from Iowa. I have seen the Senate and the House held for hours upon great constitutional and governmental questions by men of eloquence and power, but any man who can throw his emotions into the woolen and cotton schedules and captivate the Senate for two days by the charms of his

JONATHAN PRENTISS DOLLIVER

oratory and the sparkling humor of his repartee deserves the admiration of posterity. It was an intellectual athletic achievement that has hardly ever been equaled upon the floor of this chamber."

Personally Senator Dolliver is one of the most agreeable and attractive of men. He has good build and presence for a fighter and is ready to fight whenever the signal sounds; but no man is better satisfied with peace or readier to meet one half way who comes under an olive branch. He has a strong, warm hand-clasp, a good democratic greeting and a hearty laugh always on duty, in spite of his black hair and flashing eyes and tendencies according—borrowed from Virginia, where he was born just beyond a half century ago. He is a lawyer by instinct and education and never held a political position till he began his career in Congress. He served nearly twelve years in the House and for the past nine years has been a member of the Senate.

No one ever tires of watching Senator Dolliver.

Senator William E. Borah

Into the intricacies of tariff debate there was drawn discussion of an income tax, thru amendments offered to supply the revenue which it was claimed the present bill will fail to produce. In deference to previous findings of the Supreme Court, these amendments called for deep constitutional consideration. That is evidently to be one of Senator Borah's strong points, and he grasped the opportunity. It was not the first time, tho he is one of the new men—elected to the Senate in 1907—for he has already taken part in several profound constitutional discussions, securing for himself thereby a position on the Senate Judiciary Committee and suggesting the possibility—one hears it whispered among the Senators and in the press gallery—that the long felt want of a successor to Spooner may yet be filled. His speech on the constitutionality of the income tax was one of the ablest arguments in its favor to which the Senate has listened in a long time. It elicited a long reply from Senator Sutherland, another conspicuous constitutional authority, resulting in a most valuable legal discussion of the mooted question.

Senator Borah was born in Illinois, forty-four years ago, and began practicing law in 1890, devoting his time exclusively to his profession till he was elected to the Senate. He has naturally confined himself largely to legal discussion, since then, while getting his bearings on gen-

WILLIAM E. BORAH.

eral legislation; but in the meantime he has succeeded in creating an exceptionally favorable impression as a keen, clear thinker; broad-minded, level-headed, "safe and sane," and a distinct addition to the Senate.

He is not a large man, but dignity and imperturbable poise give him command of the situation, when he is on his feet. His voice is unusually clear and penetrating without effort. He speaks easily. His language is graceful, concise and effective. There is nothing of the tornado about him. Even his mass of long brown hair and bushy eyebrows fail to overcome the impression of cordial, frank good nature, emphasized in the rest of his face—a peculiar face, usually dominated by a smile instigated by characteristic friendliness. But when the Senator is on his feet, his eyes intense

with earnestness, the hair falling over his forehead, energy and confidence, without excessive demonstration, in every gesture, the real strength of the man appears and the promise of what he will yet be in the Senate. He has the instincts and proclivities of a real Senator, and is one of the new element who will repay watching thru years to come.

Senator William Alden Smith

The Minute Man of the Republican side of the Senate, when the band begins to play, is Smith, of Michigan—William Alden Smith. Physically he is one of the small men, but he is a fighter, and when it comes to the courage of convictions he is one of the largest men in the Senate. He asks no quarter and gives very little till he is safely victorious. He has taken advantage of several opportunities, dur-

worth telling again, if one is trying to pen-sketch Smith, of Michigan. Senator Smith was then a member of the House and was one of the commission sent down to investigate conditions in Cuba. The Spaniards were not particularly pleased and not over-zealous in affording easy means for research. The delegates were over-protected by a military escort whose duty, it seemed to Smith, was to prevent their finding out anything; so he slipped the guards and began investigating on his own account. His escape was discovered and five soldiers were sent to round him up. They found him and began firing volleys of words which he could not understand, but to which he replied in vehement Michigan. Unable to move him that way the five soldiers got in front of him with fixt bayonets and began to advance. Smith was only armed with an umbrella, but he drew it manfully and fell upon those five soldiers and put them all to flight. It was the first battle of the Spanish war, and *the American* was victorious.

That was, is, and will be, Senator William Alden Smith, of Michigan. He is on his feet in an instant when words are required, and he has them at his tongue's end—good ones, well put together, saying unmistakably what he means, with a vigor and earnestness which always remind one of the first battle of the Spanish war. But socially Smith is one of the most delightfully cordial and courteous men to meet. He is as earnest in expression of his friendship as he is of his disapproval, and as reckless of distinctions in following the dictates of his convictions. He will attack the mightiest in the Senate as cordially as he will shake hands with the commonest of us who may seek a word with him. He has a peculiar face, which easily lends itself either to friendliness or antagonism. His clear gray eyes look either way with impunity. His iron-gray hair, cut rather long and parted well on one side, is always brushed close to his head to keep it from flying about too much in spontaneous encounters. His movements are quick and vigorous.

Senator Smith was born in Michigan, in 1850, and admitted to the Bar there in 1883. But he began public life earlier, for he was once a page in the Michigan

Copyright, 1908, by Harris & Ewing

WILLIAM ALDEN SMITH.

ing the tariff debate, to stand for his principles in a way which made the galleries long for the right to cheer. The old story of the first battle of the Spanish war is so thoroly characteristic that it is

House of Representatives. He began a vigorous newspaper career still earlier, and has never dropped that youthful newspaper affinity. He is now chief owner of the *Grand Rapids Herald*—the leading morning paper of Western Michigan. He served fourteen years in

the National House of Representatives before he was elected to succeed General Alger in the Senate. He may not be a leader, yet, but he is a good man to have on your side, for he will speak right out in meeting for what he believes. He is not afraid.

The Industrial Department of a Railroad

BY IRA H. SHOEMAKER

INDUSTRIAL AGENT OF THE DELAWARE & HUDSON RAILROAD CO.

IN the course of development of any large business there comes a time when the work must be systematized by departmental organization and the placing of skilled men at the head of each division, with the expectation that the attention and energy thus centered on each department will result in greater efficiency and activity.

Railroad companies probably have the best organized business system in the world. A president is at the head and various departments are established to facilitate the handling of the different branches of work. The industrial department is one of the late features being specialized by railroad companies, and altho born of a somewhat selfish motive on the part of the railroads, it has proved of value to the general commercial world, and its usefulness is rapidly increasing as its methods become better known. In the old days when

manufacturers started a new enterprise, the chief question considered was power, and usually a waterfall was sought and the mill located at that point. Time has brought about a change. Railroad transportation has revolutionized not only passenger travel, but also the methods of manufacturing, and today the chief things thought of in determining the location of a manufacturing plant are: At what point can the desired raw materials be procured at the lowest freight rate; in what territory can the manufactured product be marketed with the best sales results; which road offers the best transportation facilities; what is the supply of labor, both skilled and unskilled; what are the living expenses, the tax rates, the banking facilities; is the power furnished to be uniformly depended upon; can electric energy at this point be supplied at a lower cost by water power than by coal as a fuel. All these prob-

lems must be solved by the prospective manufacturer of our time before he can select a location combining the maximum of advantages with the minimum of disadvantages.

While the manufacturing interests realize that this question of location is an important one and has much to do with the ultimate success or failure of their enterprise, yet it is almost impossible for the average business man, because of lack of time or opportunity, to collect sufficient data of a reliable and helpful nature. This is where the industrial department of a railroad steps in.

The railroad organization naturally embraces specialists in many lines. There are departments of traffic, transportation, engineering, accounting, mechanics, geology, etc. All of these contribute their quota to the assistance and furtherance of the industrial department. The traffic department supplies on an instant's notice any kind of data required in regard to rates. The transportation department is always ready with prompt and useful information as to movement of trains. The engineering department co-operates in the matter of sidetracks. The accounting department facilitates the adjustment of claims. The mechanical department offers valuable suggestions to manufacturers with reference to equipment. The geologist supplies the analyses of ores and minerals. In addition to these various departments there are hundreds of agents represent-

ing the railroad company in the local territory, as well as a large soliciting staff in foreign territories. Every man is trained to be alert in anything industrial. From one end of the line to the other the railroad company's representatives feel the thrill and interest of the industrial movement. Monthly and sometimes oftener the agents are called upon to report fully all the industrial conditions at their respective stations. All of these records are carefully tabulated and kept on file for future use. New things are continually arising and each one becomes a part of the great system of exploiting the resources of the country.

The conscientious industrial agent will not try to locate an enterprise which he believes is not adapted to his territory, because in so doing he would not accomplish the result desired by the railroad company; for if the industry should not be successful there would be no resultant traffic, and the railroad company would be subjected to continual annoyance on the part of shippers for the adjustment of rates so as to keep the industry alive, and in case of a failure on the part of the industry, it would be a poor advertisement for the railroad. Thus it will be seen that while the desire of both parties is in a measure selfish, the industrial agent must keep in mind both sides of the question, knowing that the profits to the railroad will be in direct ratio to the success of the industries along its lines.

ALBANY, N. Y.

The Standards of Animals

BY BOLTON HALL

THE dog killed half a dozen sheep. Said he: "That is quite natural; I am only doing what any dog would do."

The street car company ran only half enough cars. Said the director: "The dividends are in the straps; all the lines do that."

The merchant arranged for a rebate on freight. He said: "That is business; I am only doing what any merchant would do."

The dog was condemned as a public nuisance and shot.

NEW YORK CITY

The Industrial Struggle

BY W. J. GHENT

Author of "The American Economy," "Money and Labor," etc.

THE fierce struggle for bread forces an increasing number of persons into labor. The proportion of the whole population gainfully employed was 34.7 per cent. in 1880, 37.2 per cent. in 1890, and 38.2 per cent. in 1900. While during the last decade the population increased by but 20.7 per cent., the number of occupied persons increased by 22.3 per cent. Such is the stress of the battle that fresh recruits are constantly demanded, and the cradle and the grave, as General Butler reported of the defense of Petersburg against General Kautz, are robbed of about equal proportions to maintain the conflict.

The old, it is true, find greater difficulty in securing steady places in the ranks; and they tend more and more to become the scavengers and pariahs of the great industrial army, who must pick up a living as best they can. For only the strong and energetic are accepted for the hard and courageous tasks, while the tasks requiring nimble fingers or alert eyes are more and more given to young

greater service. But those out of whom the greatest profits can be wrung are eagerly accepted for the ranks. Women are drawn from their housework, and children from their studies and their play. Since 1880 women in employment have increased by 32.8 per cent., since 1880 by more than 100 per cent. Considerably more than one-sixth of all children between ten and fifteen years of age were employed in 1900, an increase since 1880 of 56.5 per cent. The percentage of all children at work was 16.8 in 1880; in 1900 it was 18.2. All is grist that comes to this capitalist mill, if only it can be ground into profit.

The gainfully occupied part of the population, according to the census of 1900, numbered 20,973,233 persons. On the basis of their occupations, I have here arranged them in four main classes and seven sub-classes or general groups. The capitalist class, the operative farming class, the professional class and the working class are the main divisions, and two of these are further classified.

OCCUPIED PERSONS BY CLASSES.

Excerpt from the census volume on Occupations, Table No. XXXII-XLIII.

Occupational Class	Per cent of increase	No. 1900	No. 1880	Per cent of total	Sex
Capitalist class—					
Executive, managerial, and business occupations	74.9	10,428,008	7,838,004	50.0	50
Professional occupations	11.1	1,292,008	602,000	6.2	1.0
Total, capitalist class	86.0	11,720,016	8,440,004	56.2	51.0
Operative farming class—	22.7	4,085,008	3,311,000	19.5	4.0
Farming, stock raising, and forestry	7.9	1,005,008	1,110,000	4.8	0.0
Working class—					
Manual and mechanical	13.3	3,813,008	3,095,000	19.6	17.0
Transport and communication	1.0	1,005,000	1,005,000	5.3	0.0
Domestic and household	10.3	1,275,000	1,005,000	6.4	0.0
Service and minor	11.7	1,995,000	1,205,000	10.0	14.0
Total, working class	36.3	8,088,008	6,310,000	39.3	31.0
Total, all classes	38.2	19,808,024	14,750,004	95.5	82.0

*This estimate of the growth of each branch is approximately correct, although based on data taken from several different sources.

women and children. Thus the old, though under the same stress of need as the others, must hang upon the flanks of the strong, permitted to do only the meanest and most unremunerably recompensed tasks, all the while wistfully looking for an odd chance to be of

Of the four main divisions, or classes, three have more than held their own in relation to the total. The operative farmers—including owners, tenants and managers of a wide range of rural industries—alone have fallen back. The figures would be still more unfavorable for

them but for the increase of tenantry; for the owners themselves, who constituted 14.4 per cent. of the occupied population in 1890, declined to 12.7 per cent. in 1900. They operated 74.5 per cent. of all farms in 1880, 71.6 per cent. in 1890, and only 64.7 per cent. in 1900. Tho farm laborers and share tenants gained considerably in numbers, it is evident that agriculture and its related industries support a relatively decreasing population. The value of the rural product advances by enormous strides; in the ten years between 1889 and 1899 it increased by 92.2 per cent. But the number of persons occupied thereby, tho increasing absolutely, fell from 44.3 per cent. of the total of occupied persons in 1880, to 37.68 per cent. in 1890, and to 35.71 per cent. in 1900. Doubtless the improvement of machinery has had much to do with these changes. Dr. H. W. Quaintance, in his monograph on "The Influence of Farm Machinery on Production and Labor," shows that the average relative displacement of labor in producing eight of the nation's main crops has been 42.5 per cent. in something like a half-century. Agriculture is rapidly following in the wake of factory production, and bringing forth a constantly increasing product by a relatively decreasing number of workers. Like factory production, further, it is creating a class of magnates at the expense of a class of proletarians.

On the face of the census figures the farm laborers have increased by the notable percentage of 44.7. The figures given for this group in the foregoing table are not identical with those of the census volume. A conjectural separation of employers and employed in some of the lesser groupings has been made here, causing some slight differences in the total. Doubt, however, is thrown upon the rate of increase given above by the warning of the census officials that a mistake was probably made by the enumerators of 1890. The correction of this alleged mistake would just halve the rate of increase, leaving it at 22.4 per cent. The discrepancy is not so important as it might otherwise be, since the fact that farming land is coming more and more to be operated by landless workers is attested by other figures, about which there

is no dispute. Farm tenantry increases, steadily and generally. In 1880 tenants operated 25.5 per cent. of all the farms in the United States, in 1890 they operated 28.4 per cent., in 1900, 35.3 per cent. With two or three insignificant exceptions, every State and Territory shared in this increase. Ownership declines relatively, tho slightly increasing absolutely, and every year sees a greater number of farms operated by non-owners. The "cash tenant" may be indulgently regarded as a small capitalist in his way, but the "share tenant" is no other than an agricultural proletarian. For all practical purposes the group of agricultural laborers should be made to include the "share tenants." Were this done, the group of propertyless farm workers would be swelled by 1,273,366.

Of the capitalist class, the "big fellows" have gained ground, while the "little fellows" have lost. The latter are not maintaining their relative strength, and are destined to a continuing decline. The professional class, on the other hand, has slightly advanced its numerical standing. But it is exceedingly doubtful if it has advanced its fortunes. Few phases of modern industrial life are more pathetic than the yearly outpouring of thousands upon thousands of aspiring candidates for place and honors from the professional schools, their tumultuous invasion of the callings for which they have been trained, and their eager quest for work. To these thousands are added other thousands, many of them half-fledged and inefficient, from the correspondence schools.

"Every gate is thronged with suitors, all the the markets overflow."

and yet month by month the throng swells in volume, and the rivalry becomes keener and more desperate. Such is the manner of their hiring generally, that not many of them, however idle, would appear in the census records of unemployment. The lawyer waiting for a litigant, the physician for a patient, are of course, gentlemen "practising their professions," and must not be confounded with the common workman looking for a job. And yet it may truly be said of any one among tens of thousands of them that in a year he suffers a greater duration of enforced idleness than the most

luckless day laborer. In some of the newer professions which are being constantly created, particularly in those wherein marked engineering or mechanical skill is required, there is at first a demand sometimes greater, and often at least equal, to the supply. But here again the chance of success acts like a magnet, drawing aspirants from all quarters, and soon there is a glut. With the increasing competition for employment, moreover, the rewards for professional services generally decline, and excepting the fortunate few who bear to the rest of the class something of the relation which the industrial magnate bears to the day laborer, the professional worker must accept what he can get. Less and less can he dictate his terms.

Of the working class, two of the general groups—the manufacturing and mechanical workers and the domestic and personal workers—have lost ground. But the class as a whole has notably increased its numbers. On the farm as in the city there is a progressive divorcement from ownership. It is reasonable to suppose that by the end of the decade the working class will constitute about three-fourths of the occupied population.

With this increase in numbers on the one hand, the improvement of machinery and the consolidation of industry on the other, there follows an increase of unemployment, and a decrease of wages, actual if not nominal. The workers produce values which are not returned to them in wages; with what they get for their toil they can buy back but a fraction of what they produce. There thus comes about a glut in the volume of commodities. Not that at any time there are more shoes or gowns or measures of wheat than are needed and desired by the working men and women of America. There are probably not. But there are

always on hand more than these men and women can buy. They get one price for producing goods, but they must pay another and greatly augmented price to buy these goods. This glut in the volume of commodities is relieved only by shutting down production or by exportation; and when exportation declines there is a consequent decline in employment and wages. The shutting off from our manufacturers of any of the important fields to which they now export goods would produce an industrial crash with frightful consequences.

Viewing the growth of wealth in the hands of a small group of capitalists, will the workers, increasingly preponderant in numbers, continue to acquiesce in it? And experiencing among themselves at the same time a keener rivalry for employment, a lowering of wage-rates and an ever-declining security of livelihood, will they not collectively strive for a social system which promises them a complete control of industry and an immunity from want? They have the ballot, and it is not to be supposed that it can be taken from them. What they have heretofore lacked is a common will. Those among them who have developed a consciousness, more or less partial, of common interests, have for the most part heretofore contented themselves with "that poor, pathetic weapon, the strike." But with the strengthening of employers' organizations and the appearance of masses of unemployed who are willing to work at any wage, the strike fails as a means of securing the workers' demands. More and more the workers come to see that the ballot, wielded not in behalf of one or the other of two contending camps of capitalist owners, but as a weapon of working-class interests, in accord with a working-class policy, is the one and only means of gaining their ends.

Oxford Contrasts

BY ALAIN LE ROY LOCKE

[Mr. Locke is the first Negro to win a Rhodes scholarship. He won the honor when a senior at Harvard in competitive examination over seven contestants. His father was a lawyer and his mother a public school teacher. This article was written last year while Mr. Locke was in his first term at Oxford. He comes from Philadelphia.—EDITOR.]

IT cannot be too strongly emphasized at the very outset that what follow are but sketchy impressions of Oxford and Oxford life, based upon only a term's residence and observation; a period just long enough, it may be said in apology, for one to have corrected one's preconceptions, on the one hand, and not yet have contracted any bias or prejudices on the other. Oxford to most Americans, to tourists in general, the Oxford of the summer vacation is little more than a heap of legends and a pile of stones; they go very well together—legends and stones—and deceive only those whom they puzzle. But the real Oxford, the living society of term time, is puzzling only on the closest scrutiny, and in proportion as one is undeceived; for it is, indeed, the most baffling of paradoxes. All appearances to the contrary, Oxford life is not medieval, but most modern; while it is Oxford thought, Oxford ideals of education that both seem to be and ought to be modern, which are, to my way of thinking at least, most medieval. These two significant facts, with the several significant contrasts they make between Oxford and American universities, are all that this article can attempt to sketch, and that only in barest outline.

Certainly the most fundamental, tho not the most evident, difference, a contrast hard to appreciate from an American viewpoint doubtless, is the simple fact that this great English university is a society of scholars, a scholar-craft for the perpetuation rather than for the extension of learning, for the maintenance of its dignity as a class profession more than for its dissemination either as an institutional or popular heritage. Wherefore it follows—as the night the day perhaps, yet quite as inevitably, that the typical Oxonian is neither a philosopher nor an educationalist in ours or the German sense of the terms. For the typical

Oxonian's philosophy is a philosophy of manners, ethics of the Aristotelian sort rather than a system of thought or even a systematization of knowledge; and his pedagogy is based upon the principle of the craft-guild, the principle that whoever has served his apprenticeship is a journeyman and fit to teach apprentices, and whoever has matured as a journeyman is, in turn, master over journeymen and a guardian of the profession. This is why the ability to parse Greek sentences is thought to imply the ability to teach the parsing of Greek sentences. And why also a master's degree is conferred for four years further enrollment upon the university books after graduation, a sufficient time, in all reason, for the discipline of the undergraduate *régime* to have ripened into character, or as some one has facetiously put it, just time enough for a man to have recovered the mastery of himself.

Both the inherent excellence and defect of Oxford as an educational system seem to center here. Because his philosophy is a philosophy of manners, and the discipline of study goes hand in hand with the discipline of living, the typical Oxonian is inevitably a man of culture—a man whose learning bears some vital relation to his life. Because his theory and practice of education is the theory and practice of a craft, the typical Oxonian's learning is his own private property by which he makes his living or maintains his social standing, and which he finally bequeaths to his sons. That is to say he is neither by temperament nor by force of social obligation a teacher. The Oxford professor is very like the professional type the world over, but the Oxford "don" or tutor, as compared with an American type that boasts himself, Prometheus like, "a maker of men," is very like a prudent gardener who relies a prayerful lot on the sun, and the wind, and the rain—on his system and the nat-

ural laws of growth. Not that he isn't painstaking and watchful, but he would as soon think of inoculating a set of young men with a dangerous or contagious idea as a gardener of pouring worms in his garden; as soon think of reversing the natural, logical, traditional order of exposition or of altering the perspective to inspire interest and enthusiasm, as a gardener of planting a bulb upside down. And, again, an Oxford man who goes out to teach would hardly go out with the idea of making little Oxfords over England, but of selecting and making little Oxonians, orienting them toward the great Mecca of their fathers. Education at Oxford, in brief, influences and influences for life every one who becomes a part of its corporate life. This is its excellence. But the same system gives Oxford a sort of religious dominance over the province of knowledge that certainly makes the right to teach, and too often the right to be taught a matter of apostolic succession, and excommunicates all education that does not subordinate itself as directly preparatory to that system. This is its defect: both excellence and defect are medieval.

These statements will seem unkind and adverse to those who think it a reproach to be called medieval—but by such Oxford never can be understood or appreciated. It is more serious that they will seem unjust and untrue to many who are familiar with the slow but persistent progress of university reform at Oxford. Is not Oxford, such men will say, the source of the movement for the extension of university teaching? She has established, and maintains in flourishing condition, an elaborate system of honorary degrees. It is a matter of commonplace that the honor school of history is becoming so popular as almost to dispute the traditional ascendancy of the school of the humanities. Then there is the new movement in the study of sociology, the diploma system, the recently proposed engineering department, and the promising Curzon fund for the express furtherance of university aims and development.

But notwithstanding all this, the contention is that Oxford is still medieval; not, indeed, because the Oxford system is antiquated, but because the typical Oxonian's idea of the purposes and

privileges and ideals of education are. University reforms seem like the yielding of the outer walls, while deep within the old *régime* flourishes with greater intensity because of its restrictions—indeed, with the religious intensity and fervor of a beleaguered city of the elect. And the greatest misfortune is that what was once a society is fast becoming a sect. There are circles in Oxford still where, if Truth is an open book, it is like those books of childhood memory, too heavy for youthful knees, and opened only on the maternal lap. In those same circles, an instructor is an intermediary rather than a guide; and a library a precious granary stored against intellectual famine, and not a mint and exchange for the currency of modern thought; and there, too, scholastic distinction means social privilege more than simply certified skill or attainment.

The usual, trite criticisms of Oxford are as unfair as they are unreasonable. Oxford is above all else consistent, and one must either take issue with the system or with nothing at all. It is foolish, for instance, to charge Oxonians with pedantry, granting their contention that the best thought is impersonal, and that a first-class mind is like a first-water diamond, colorless and transparent. Again, from a certain point of view, dignity is superciliousness; and craft-secrets, charlatanism; and an aristocracy of learning, which Oxford is indeed, must needs seem wrong side out if viewed from the outside. This is what is meant by saying that Oxford is medieval, and that it must some day face, not reforms but reform; that is to say, be challenged as a system. And that day, to the lasting and reasonable regret of many Oxonians, Oxford will probably choose to become modern.

But once this ancient tradition, that every one admits to be one of the most effective and desirable of educative influences, is driven out of scholarship, where will it take refuge? It is to be hoped in university customs and social life, where it is supposed even now to be rooted, but is so only nominally. Oxford social life is a remarkably well-seasoned and well-working system, rather paternal, it is true, but one where every university function, every uni-

versity custom is both the occasion and the cause of some little bit of wholesome social life. Even when the difficulties of American contrasts are met and the social antipodes meet, the system by no means breaks down; and under the usual English conditions of more or less approximation to one scale or standard of living among college men, it is or should be the great paradigm to American universities. For one of the greatest of our university problems, I take it, is to make the social life of students the corporate life of the university, and so to equalize its contrasts and fraternize its so-called fraternities as to make it worthy of a single name. Inter-collegiate sports in which the public cannot take sufficient interest to seriously intrude itself upon undergraduate life are another thing that should be our present envy and despair. Some would claim that our American college debate brings students enough into contact with non-academic life and problems to anticipate all charges of intellectual provincialism. But the English equivalent, a sort of mock parliament, has the additional advantage of being the direct preparation for civic usefulness our debate is supposed to be. Our average college debating is as good a training for open—that is to say public—mindedness as football is for healthy, normal living.

But to call Oxford social life effective does not gainsay our contention that it is not what it is supposed to be, a noteworthy survival of medievalism. It is of all things most modern. There are the old customs, the old forms, it is true. The very same that seem so "medieval and quaint" to the tourist, are so formally observed as to have little or no meaning. The living conventions of Oxford social life are the fashions and customs of the English "public" or preparatory schools. It is rather disillusioning, for instance, to hear in connection with the gown-wearing custom that every night scores of undergraduates run the risk of losing five shillings rather than be bothered by them, and that the university administration thinks the temptation so natural as to count upon its being profitable—and finding it so. Money fines and dispensations,

which are quite the rule at Oxford, have marked the disintegration of medieval codes of discipline before this. And when medievalism has been driven out of scholarship it will have ample work to do, filling with the true spirit of reverence and tradition the observance of what are now largely formal conventions of student life and custom. This superiority Oxford will always have over most American universities, however, that it is a place of select retirement, so necessary—since a place of preparation is necessarily a place apart—the one thing that may ultimately keep the urban American university from being the home of scholarship, of beauty and repose.

Tho much of the beauty of Oxford is latent in its mouldering stones and the conventional observance of its own traditions, there is one beauty of tradition that is its chief charm—of great antiquity and slow growth, and therefore as yet almost below the horizon for our more westerly prospects. It is the beauty of impersonal service that only the oldest and most sanctified of institutions can command. There is in the teaching and the living of Oxford a self-effacement that almost seems to be self-sacrifice until one reflects how human and dignified and well-proportioned it is withal in its very humility. It consecrates even the most aristocratic of all aims, self-culture, and makes one wish democracy did not need to be so blatant, so self-assertive—but it does need to be.

But what is the point of all this contrast, all this that one calls the paradox of Oxford? The simple fact that Oxford is a place worthy of the respect of all, the thinking consideration of many, the pilgrimage of some. Further that Oxford and American universities are so different that, in the main, the faults of the one are the virtues of the other and vice versa. There is a class of men, the American Rhodes scholars, whom these contrasts vitally concern, and in conclusion a word concerning them.

It has often been remarked that the credit given for three or four years, as the case may be, in American universities, is very slight, and to those who know that socially and in all college as distinguished from university matters the

Rhodes man becomes a "fresher commoner," even this credit seems merely nominal. But what else can it be if Oxford is such a craft-guild of learning? The very essence of its discipline is that the journeyman should have been an apprentice, and the master, a journeyman, and that the generations of the craft should have grown up beside each other. In such a system there is no anticipating the first or any intermediate stage. And then again does it follow that, because the defects of the American system are the virtues of the English, the finished Rhodes man is the well-rounded man public opinion expects him to be, the perfect circle logic makes him out? By no means. If he has served his time and purpose well, he will be, I take it, a man whose sympathies are wider than his prejudices, whose knowledge is larger than his beliefs, his work and his hopes greater than he himself. He will be an ideal type—a rare type, indeed—a patriotic cosmopolitan. The representativeness of a Rhodes man is often spoken of in diplomatic terms—and it is in a sense a diplomatic mission with this difference be it added for prospective Rhodes men: Whereas the cash value of the diplomat is earned in his own country, and his credit-value good currency abroad; the Rhodes man will find that his paper value presented to him in his commission, so to speak, is at home, and his title to it, indeed his title to any exceptional consideration whatsoever must be earned at Oxford.

There is one more contrast, one which it is my privilege to have observed as a personal experience, that is mentioned with greater deference to a sense of duty than to its own private claims. To one who has lived upon the cleavage-plane of so great a class distinction as that of races in America, distinctions are marvelously subtle things, they are so broad as sometimes to seem ridiculously unreal, self-contradictory, yet they manage to evade the keen edge of logic which splits

a hair instead. And real as they are, they are too often due to defective eyesight all round. In a land of class distinctions, distinctions which have taxed my blunt democratic vision, I have found no race distinctions, and better still in cultured circles no race curiosity. While in America, where they boast of having no class distinctions, there are both race distinctions, and a certain strange race-curiosity which most optimistically interpreted is a forerunner of race-sympathies and understandings. What is there left to say but to repeat what has been said before—the faults of one system are often the virtues of another, and vice versa? There is something more, however. I shall not speak of individual preferences—they mean little, for wherever a man consents to live there, I take it, he is satisfied or ought to be—or else values some other things he possesses actually or in prospect above his self-satisfaction. But racially, I prefer disfavor and that most proverbial and effective of disciplines, persecution even, to indifference. One cannot be neutral toward a class or social body without the gravest danger of losing one's own humanity in denying to some one else the most human of all rights, the right to be considered either a friend or an enemy, either as helpful or harmful. So for the good of every one concerned, I infinitely prefer race prejudice to race indifference. Further than this, I believe that we, with our ten million odd problems, each solving his own and then, if need be, helping solve his neighbors', will have completed our gigantic task before the sixty million combined will have come to terms with that one stubborn, irreducible fraction they call "the race-problem." And then, in shame and annoyance, they will wash the scribbled slate clean, and begin all over again—it is to be hoped, on the next problem. It is a far cry from this to Oxford, but not as far as from Oxford to this.

THEODORE ROOSEVELT

Literature

New Amsterdam

THE moment for the publication of the first two volumes of a *History of the City of New York*, by Mrs. Schuyler van Rensselaer,¹ has been wisely chosen, in view of the coming Hudson celebration. No better or more permanent souvenir of the occasion can possibly be desired than these two volumes, which are ample guarantee of the quality of the two that are still to follow.

Mrs. van Rensselaer—where could a fitter name have been found to place upon the title page of a history of New Amsterdam than this?—has planned and thus far carried out a work of more than local significance and value, in this, that from her first page onward, she keeps in mind the larger significance of the Dutch settlement on the Hudson, *i. e.*, its relation to and influence upon the English colonies between which it intervened, a wedge, but also a meeting-point, where so much of Anglo-Saxon tradition and institutions was modified and adapted to the future uses of democracy. New Netherland—New Amsterdam more by token—was a melting pot, and not the least important of the ingredients it served to fuse were of Dutch provenience. This historian says:

"Seeing how distinctly English in origin are most of our institutions and in how democratic a temper they are administered and by the people endorsed, modern Americans fail to understand that, while England did largely give us our belief in the rights of the citizen and in the practicability of republicanism, it was not the well-spring of our republican ideals. These developed inevitably on colonial soil, and their growth was helped much less by British precept or practice than in the beginnings by Dutch influences variously transmitted, and in later years by French teachings and example."

These be sane words in a sane historical study, which is notably impartial and just, free from the wholesale glorification of all things Dutch that, some twenty years ago, marked the beginning of the end of the predominance of the

New England school of American historians, who sought in England alone, and nowhere else, the origins of our institutions. The late Douglas Campbell was one of the pioneer enthusiasts in the service of the Dutch claim to the predominant place among the formative influences of the United States; with him the pendulum swung to the other extreme. In Mrs. van Rensselaer's book it assumes its normal position.

The historian of New York is confronted with a lamentable lack of documentary sources, especially in the earlier years of the settlement. Indifference—nay, more, blindness—at home led to a neglect of records that in later years could no longer be consulted; those of the Dutch West Indian Company, for instance, sold by that languishing trading concern early in the nineteenth century as old paper, and destroyed by its purchasers. Whatever sources remain, however, at home and abroad, have served in the preparation of this history, another of whose merits is its sound appreciation of the influence of European international policies upon the history of New Netherland and the colonies to the north and south of it.

Mrs. van Rensselaer deals with the story of New Amsterdam, not with that of the whole province, except in so far as is necessary to give the proper perspective, this appreciation of relative values and meanings extending also to the British colonies. Hence the wider, the national usefulness of the work.

These first two volumes cover the story of New York during the period from its foundation to the accession of William and Mary—its Dutch existence. The remaining volumes will be devoted to the English domination and the years of the Revolution, 1789 being chosen for the conclusion of the history, the year of the inauguration of Washington as first President of the United States.

"To go farther than this would not be to continue the same story, but to begin on the same ground one of a different kind. Early in the nineteenth century there dawned for New

¹HISTORY OF THE CITY OF NEW YORK IN THE SEVENTEENTH CENTURY. By Mrs. Schuyler van Rensselaer. New York: The Macmillan Co. 2 vols. Svo. \$5.00 net.

York a new period of prominence, during which it grew to be the chief city of the new nation and the New World. But in 1789 its original kind of importance was shorn away from it. It was no longer, as it had been for generations, the capital of a province independent of its neighbors and semi-autonomous, or, as it had been in recent years, the capital of a virtually independent State; and eight years later it ceased to be even the capital of one of the United States."

In this review only a general impression is conveyed, the impression left by the work upon the reviewer, which is one of sound historical balance, of well-seen proportions and well-drawn conclusions. Father Knickerbocker does not boast; he is merely conscious of the value of his contribution to the building of the nation. Within twenty years after its founding, eighteen languages were spoken within the limits of his town. He refashioned all this heterogeneous material after his own sturdy image; its descendants he taught to be good Americans. He has never ceased from performing this service to the country to this date.

Following in Douglas Campbell's footsteps, the Rev. Dr. William Elliot Griffiths has rendered good service these last fifteen years as a popularizer, among young Americans, of the historical service of Holland to their country. His books are enthusiastic and they are picturesque, sufficient unto their purpose. To their number he now adds, in commemoration of the Hudson celebration, a fifth volume, *The Story of New Netherland: The Dutch in America*, in which, as always in his writings, the human element prevails over the scientifically historic. His books deserve a place on the shelves of every New York boy and girl who boast Dutch blood, as which of them cannot?

In this connection it is appropriate to refer to the new edition of Motley's *History of the United Netherlands* in two volumes, printed on thin paper, which brings the work much larger in bulk than the "Rise of the Dutch Republic," of which it is the continuation, within handy compass.

Motley continues to hold his honored place among the Dutch historians, a pioneer in many ways, and still, in some, their guide. This edition, from the press of his original publishers in this country, is provided with a brief introductory note, which draws largely upon his correspondence for the information it conveys. This fact will serve as a pretext, if one be needed, for a reference to this "Correspondence," edited by George William Curtis, a strikingly brilliant collection of letters that is well worth re-reading, and especially worth recommending to the attention of a younger generation, which is not likely to turn to it unless invited in this way.

Of the *United Netherlands* nothing new can be said at this late date, except what has just been written above. Motley's three great works remain the best on the history of Holland during its most important period available to the English reader. They continue a living influence, because to sound scholarship they add a contagious, uplifting enthusiasm for the great causes of humanity whose fate was decided in the Low Countries three centuries ago.

Church Music

IN *Songs for the Chapel* the editors have chosen hymns that express "normal and constant Christian experience" rather than those of spiritual exaltation. Watts, of course, leads, with thirteen hymns; next to whom follows How, with eight; Wesley, with seven; Faber and Monsell, each six; Bonar and Whittier, five; Doddridge, S. Longfellow, Montgomery, Heber and Ellerton, four; while Newton, Pollock and Thwing have three each. By this summary it will be seen that the book represents the modern changes in religious sentiment. The hymns have been selected with good taste, specially chosen for students' use. Modern music has also been chosen, of the English churchly type, as is the fashion today with compilers of hymn and tune books, twenty-seven of the hymn

The Story of New Netherland: The Dutch in America, by William Elliot Griffiths. Boston: Houghton Mifflin Co., 1909. 40 pp., 10c.

History of the United Netherlands, by Louis Motley. New York: Charles Scribner's Sons, 1909. 2 vols., 12mo., 75c.

Songs for the Chapel, arranged by Miss Vernon L. Ogden. Boston: American School and Society, 1909. 112 pp., 10c. Officers of Music in Harvard College and Andover Theological Seminary, H. D. Parker of the Harvard Church, Brookline, and J. H. Thwing of the Harvard Church, Cambridge, Mass., 1909.

tunes being by Dykes, eighteen by Barnby, and so on. True, the editors have chosen fifteen tunes by Lowell Mason, but could they not have allowed one less to Dykes and have kept Oliver Holden's "Coronation," in spite of critics? Must we sing the English Miles End? But despite this English leaning the book is unusually good.

No two lovers of hymns would agree as to what the hundred best hymns are. English-speaking hymn lovers would probably include about half of those counted in the Rev. John Cullen's chosen hundred,² and perhaps a larger proportion of the thirty-three placed in the appendix. Naturally Dr. Cullen's choice falls upon hymns by ecclesiastics of the English Church. If there are, as he says, but three hundred good hymns in our tongue, "Gospel Songs," such as "The Ninety and Nine" and "Safe in the Arms of Jesus," useful as they have been, can hardly be counted among them, certainly not in the first hundred; nor should a tenth of this chosen number be translations from other tongues. The only American writers here represented are Bishop Coxe, P. P. Bliss and Fanny Crosby.

Scripture and Song in Worship,³ dedicated to the memory of William Rainey Harper, superintendent of the Hyde Park Baptist Sunday School, 1897-1906, is the outgrowth of experience in Sunday school work under President Harper, individual services here given having been tested in the school. The Scripture passages are carefully chosen (Prof. E. D. Burton, of Chicago University, has aided the editors), and both hymns and music are such as should be learned in Sunday school and can be treasured for life. An occasional use of one of these services instead of a preparatory lecture or the stereotyped prayer meeting might not be amiss in some churches.

*Practical Church Music*⁴ is specially

²THE HUNDRED BEST HYMNS IN THE ENGLISH LANGUAGE, with an Appendix. Selected and Arranged by the Rev. John Cullen, Vicar of Radcliffe-on-Trent. New York: E. P. Dutton & Co. 50 cents.

praiseworthy because, from cover to cover, the author never forgets that church music should be an act of worship; at the same time he is broad enough, while discriminating against rubbish, to value in its place the "gospel song." Its general divisions treat of the minister's musical and hymnological preparation, with some valuable suggestions for theological seminaries on congregational and choir singing and the management of choirs, followed by practical applications of the subject to funerals, evangelistic work, Sunday schools, and so on, including the question of organs and their purchase. The book is, in fact, a compact, well-written encyclopedia which can be made of practical value if studied by pastors, choir leaders and music committees. Members of choirs might profit by reading such chapters as treat of church solos, choir rehearsals, and the serious import of the service which they lead. The first appendix gives a list of books helpful in the study of church music and of hymns, the second devotes more than a dozen pages to titles of chosen music for choir and solo use, and the third gives outlines and subjects for song sermons and services.

Ancient Greek Historians. By J. B. Bury, Regius Professor of Modern History in the University of Cambridge. New York: The Macmillan Company. \$2.25.

Several years ago Gardiner M. Lane founded a lectureship of history at Harvard. Of the incumbents, who are of the highest order, Professor Bury stands pre-eminent as a scholar of history, ranking with Mommsen, Busolt, and Edward Meyer. In the prime of life, he is making history by bringing in his sheaves. His history of Greece is a sober and judicial text-book of over 900 pages. But it is no mere text-book. Bury has searched the springs of action and character as the veteran Freeman has never done, and the veteran Mahaffy must yield the palm to his pupil, who, in every case, has reached to the bone and marrow of the matter. History was born with Hekataeus, of Miletos, who was also one of the founders of geographical science. But he was mainly a historian. "What I write here," he says, "is the

account which I considered to be *true*." He wrote in plain, honest prose, and in choosing it the founder of history showed his insight. He, and not Herodotus, was the first real prose writer. But in Herodotus we find "a work which time has not been allowed to destroy or diminish." Literary thefts are common in Herodotus. His description of Egypt is not original. He reproduces the account which Hekataeos had given in his "map of the world." There is little doubt that when Herodotus visited Egypt he had the book of Hekataeos with him. Bury has reasons for holding that the last three books of Herodotus were composed prior to the other six, and before he began his travels. We read the "Father of History" with constant delight, and yet we know that Thucydides must have smiled at the many millions who are said to have invaded Greece and drank its rivers dry. His sanity is like a clearing wind. Polybios, of "the Silver Age," was by no means a weak writer of history. He had learned Rome and its history thru and thru in his long exile as a hostage. He set forth Rome's strength as well as its depravity.

The Romance of American Expansion. By H. H. Himmelfarb. (With 10 illustrations.) New York: Moffat, Yard & Co. \$1.75 net.

Mr. Bruce's aim in *The Romance of American Expansion*, as sufficiently indicated in his title, is to give briefly and from the standpoint of personal adventure, as far as possible, the various out-reachings of the American spirit which has carried our banner—too often with a *wicked dash*—southward to the Gulf and westward to the points where the seal hibernates along the northern coast and the prickly cactus bristles along the Mexican border. That "wicked dash" is a part of our political history of which we do not all cherish a pleasant memory. Mr. Bruce does not altogether ignore it; he does, however, lay stress on the "dash" rather than on the wickedness of it. Our advances always—except in the case of Alaska and the Louisiana Purchase—had their picturesque figures "planting the flag" somewhere. There is a new generation to be made acquainted with these heroes and the

historian, having in mind the young, does well in keeping in the foreground Daniel Boone, Frémont the Pathfinder, and Sam Houston, who was at first "drunken Sam," then "His Excellency" the President of Texas, finally "Senator" and "Governor" Samuel Houston, pioneer and patriot, who kept his promise: "I will never forget the country of my birth." Retelling the story of these men—a story so familiar to the older generation—the historian refuses to "burn" over the annexation of Texas or the profitable acquisition of New Mexico and California by a somewhat unholy pressure, yet gives to the reader, even for this old and lapsed controversy, ample sources of information. The personal note in Mr. Bruce's work extends to Andrew Jackson for the acquisition of Florida, Jefferson for the Louisiana Purchase, Thomas H. Benton in connection with the occupation of Oregon, Seward for the Alaska cession, and William McKinley for our leap across the water to Porto Rico and the Philippines.

The Appreciation of Music. By Thomas Whitely Surette and Daniel Gregory Mason. New York: The Baker & Taylor Co. \$1.50.

Again the effort is made to train the music loving public to become intelligent listeners. Messrs. Surette and Mason have prepared their book for use in schools and colleges as well as by the general public to aid in applying to music the kind of study which has long been profitably pursued in the other arts. The work follows the evolution of musical art from the primitive folksong up to the symphony of Beethoven, illustrating this evolution by carefully chosen musical examples or extracts analyzed in the text as an aid to the concentration of attention, the focusing of mind as well as the merely physical sense of hearing on the melodies and their development. Though professedly written for those who do not care to go into "technicalities," the book would be of little value to any one without some technical knowledge of music. Further study is suggested by lists of books for collateral reading, but stress is laid on the fact that music itself is the central point in the plan of study. In view of the fact that one of the chief dif-

difficulties in the study of musical appreciation is the unfamiliarity of classical music to the ordinary student, the use of an instrument by the students themselves is recommended—and wisely, for nobody can learn to appreciate music by theoretical study; it is only by frequently hearing good music with mind as well as ears attentive that one grows to understand and appreciate its wonders and its beauties.

Literary Notes

....A frank and detailed description of life and crime in the Bowery is given by Dr. I. L. Nascher in *The Wretches of Povertyville* (J. J. Lanzit, Chicago). The author has no apparent object or literary skill and the book is filled with repetition.

....A *multum in parvo* is what the *Handbuch zum Neuen Testament* promises to be, which is being brought out by Prof. H. Lietzmann, of Jena, and of which Prof. E. Klostermann, of Kiel, has published the "Commentar zu Matthäus." It is to be a compact, solid, yet brief modern commentary on the entire New Testament, as appears already from the names of the collaborators, namely, Profs. H. Gressmann, W. Heitmüller, F. Niebergall, E. Preusschen, L. Rodermacher, H. Schlosser, P. Wendland, H. Windisch. Mohr, of Tübingen, publisher.

....In *The Statesman's Year-Book* for 1909 an increased amount of information is given without increase of bulk, thanks to changes of type, the suppression of superfluous details, rearrangements and other economies of space. This valuable reference book is so well established in world-wide public favor that comment is unnecessary. One accepts it as an authority and never finds it at fault. It may be stated here that a new section has been added this year, giving a brief statement with reference to the Hague tribunal, and a list of its members. It may be pointed out that the surviving Russian member of the Permanent Court of Arbitration, to give it its official title, Mr. H. E. de Martens, has just died, which momentarily leaves Russia without representation on the tribunal, as no successor to M. de Martens's colleague, M. Mouravieff, has been appointed yet. (Macmillan Co., 12mo., \$3 net.)

....An operatic guide book with a difference has been compiled by Leo Melitz, director of the Stadt Theatre at Basel, in *The Opera Goers' Complete Guide*, which comes to us in an English translation by Richard Salinger (Dodd, Mead & Co., \$1.20 net). Brevity and succinctness in outlining the plot of each opera and the inclusion of practically everything worthy the name of opera produced in the last hundred years were the double purpose of the compiler. The stories of 209 operas are given; also the casts and the principal airs. The plan is well carried out, tho the fullness with which

the plots are described varies widely. Such recent works as Strauss's "Salome," D'Albert's "Plauto Solo," Humperdinck's "The Fairy Marriage" and Converse's "The Pipe of Desire" (the American opera which was promised at the Metropolitan Opera House last season, but was not given) are included. In spite of numerous misprints and some errors of translation, the book will be found useful here as it has already been found in Germany. Its bulk of information cannot be easily or quickly found elsewhere.

Pebbles

PUT cream and sugar on a fly, and it tastes very much like a black raspberry.—*Atchison Globe*.

STELLA—What do you think of cars for women?

Bella—They'll want us to go buggy riding with ourselves next.—*Harper's Bazar*.

"THAT brother-in-law of yours seems to have a pretty good opinion of himself."

"I would hardly put it in as mild a form as that. He is thoroly Bernard Shawed."—*Chicago Record-Herald*.

NAN—That young man from Boston is an interesting talker, so far as you can understand what he says; but what a queer dialect he uses!

Fan—That isn't dialect; it's vocabulary. Can't you tell the difference?—*Chicago Tribune*.

HER ARITHMETIC

"But why, my love, are you burning gas so recklessly?"

"Because, John dear," said Mrs. Newlywed, "for every dollar's worth I burn you'll get twenty cents."—*Harper's Bazar*.

"WHY did you tip that boy so handsomely for handing you your coat?"

"Did you see the coat he gave me?"—*Tatler*.

RUSSIA is to reduce the number of her public holidays from 91 to 63. In neither list does Independence Day as yet appear.—*New York Evening Post*.

THE WRONG TICKET

Conductor (on railroad train)—"This isn't the right ticket, sir."

Absent-minded Passenger—"What's the matter with it?"

Conductor—"This ticket calls for a diamond ring."—*Philadelphia Bulletin*.

Two men whose offices were on the second floor were on the first floor waiting for an elevator. Long and impatiently they waited.

"You're not looking extra well, I must say," remarked the lawyer.

"No, Rangle," replied the real estate man. "Think I'll join an athletic club. I need the exercise."

"Me, too."

Still they waited for the elevator.—*Kansas City Times*.

Advertising rates will be furnished on application.

IN his little discussion of Religious Tolerance the other day at Plattsburg President Taft declared that it is rather a modern invention. He represented the Puritans as in favor of the right to worship God as they saw fit, and to have all other people follow the same way that they did. Possibly that is an extreme view of the Puritan teaching and practice, but it is popular if not historical, and has been urged particularly in circles about Boston that have reacted from the Puritan traditions. There might be a considerable evidence gathered to prove that religious tolerance, on these shores, had begun in Plymouth Colony, in Rhode Island, Pennsylvania and Maryland in the earliest colonial period, while no more eloquent defense can be found than that of John Milton, and none more forceful than that of Oliver Cromwell.

But what is religious tolerance? We suppose that properly it means the denial of physical or political restraint on account of religious faith. It is religious intolerance which burns heretics, and, equally, that which requires the

The spirit of intolerance is another thing, and is past all legal control. We cannot forbid a man to believe that views opposite to his own are therefore false and are detrimental to society; so detrimental that he will show the holder no aid or comfort. So it was that quite a little campaign was carried on in the West against Mr. Taft for President because he is a Unitarian. Believing as they did they had the right to oppose him. Their error was an intellectual one.

They thought that a bad theology proved a bad and dangerous man; a conclusion that does not follow. Yet refusing to vote for a man whose religion or politics we object to is hardly a proof of intolerance. It does not trench on a man's physical or political liberty. No man can claim the right to be voted for. If, as has often been asserted, no Catholic could be elected President, it would not prove that we are not a tolerant people. A man's vote is his personal possession, and he has the right to give or withhold it as he pleases.

The same is true of ecclesiastical action. When a case of heresy is to be acted on, the matter of tolerance or intolerance is not involved, except in a rhetorical way. It is simply a question of breadth or narrowness, of comprehension or circumscription; and a man has a right to his own views and to act accordingly. If the vote goes against the man charged with heresy he has lost none of his political or social rights. Those who voted to exclude him from his Church or its ministry have followed their conscience, as it was their duty to do. They may have judged right or wrong; if the latter, time will show it. The world is wide and there is room for all, even the excommunicate.

Here is the case of the young man, George A. Fitch, whom the New York Presbytery ordained last week to follow his father as missionary in China. Seven voted against his ordination and ten for it. The seven, or some of them, particularly Dr. Daniel S. Gregory, who edits a magazine devoted to the hammering of

all heresy, declared that in ordaining him the presbytery did what amounts to throwing the Bible out of the Presbyterian Church. He declares that the candidate denies the miracles of Christ and the virgin birth. If these seven really believe that the Presbyterian and the Christian religion rests on the miracles of Christ and his birth from a virgin—and they have the right so to believe—they have the further right to do their best to exclude the man who refuses to confess his belief in these things from the Church in which they are voting members. There is no fault to be found with them; nothing to be done with them except to try to show them that the story of the virgin birth lacks evidence. Luckily, Christian character does not depend on it, or Paul would have said something about it. Fortunately it will not be the duty of Mr. Fitch, any more than it was of Paul, to convert the Church to the virgin birth, but to faith, hope and love; to righteousness, peace and joy.

Mr. Taft and Tariff Revision

A TRUSTWORTHY American trade journal has for many years published a standard index number, based upon the average prices of commodities, such as provisions, groceries, grain, fruit, textiles, metals, coal, building materials, etc. Its number for July 1 is 8.4457, the highest in any month since December 1, 1907. Comparison shows that the increase since July 1, 1897 (a few days before the enactment of the present tariff) has been 44 per cent.

Because of the increase of the cost of living, a large majority of our people, the masses, the "ultimate consumers," have desired a revision downward of a tariff that was, by the admission of those who made it, too high at the beginning of its term. They expected that a reduction would be made at the special session of Congress. They believed that it had been promised. They regarded Mr. Taft as a powerful advocate of such a reduction. He had said that the Dingley rates "have become generally excessive." He had declared that "revision in accordance with the pledge of the platform" would be, "on the whole, a substantial revision down-

ward." Such downward revision he had in mind, of course, when he said, after his election:

"Unless we act in accordance with our promise, or if we only keep the word of promise to the ear and break it to the hope, we shall be made accountable to the American people and suffer such consequences as failure to keep faith has always been visited with. It would be better to have no revision at all, unless we are going honestly and fairly to revise the tariff on the basis promised by our party."

In the House bill the promise was not kept, for those who were mainly responsible for that measure admitted that it increased the present average ad valorem rate of 44.16 per cent. to 45.72 per cent., despite an enlargement of the free list and some notable reductions in important schedules. Still, that bill was a much better one than the bill which Mr. Aldrich and his associates have made and the Senate has passed.

Thruout the long debate in the Senate, the avowed attitude of the President toward revision was represented by those Republicans who are called insurgents, ten of whom voted against the bill at the end. It is well known that they received from him no encouragement, directly or indirectly. They are protectionists. They exposed the unwarranted and unjust additions made by the Aldrich committee. But exposure was rarely effective in causing any change to be made. They might have accomplished something if it had been known to the Aldrich majority that they had the sympathy and moral support of Mr. Taft.

These men represent directly the Republicans of the Middle West; indirectly they represent, in our opinion, a great majority of the Republicans of the entire country. It is interesting to recall Secretary MacVeagh's remark in an address made a few weeks ago at Chicago, that it was desirable to satisfy the people of this Middle West, and that, if they should not be satisfied, the tariff question could not be put out of the way.

It has been reported in the press from day to day, for many weeks past, that the President continued to be confident that the bill finally passed would be one in accord with his views, and what have been regarded as the promises of himself and his party. But the Aldrich majority from day to day were loading

down the bill with provisions at variance with those views and promises. It was said that he believed the desired downward revision would be made by the conference committee. But such a revision was not within the range of such a committee's powers. And it was not intended that the committee should be composed of men inclined to revise downward. Everybody knows now who the members are. The Republican majority (which is to do the work) is made up almost without exception of inveterate stand-patters. Certain members from the House have been selected because of their known opposition to House reductions in which they have a personal interest. How can any one, knowing what House and Senate have done, what the powers of a conference committee are, and what the attitude of the dominating members of this committee has been thruout the discussion, expect that the committee will agree upon a bill "better than the House bill"? The result of the committee's labors may be a slight improvement upon the Senate bill, but it will be a measure worse than the one which the House sent to the Senate.

Now, there is a perceptible sentiment on the Republican side of the House in favor of all the revision downward that the House bill permits. Representatives are not far from the people, and many of these men have heard from their constituents. Mr. Taft would like, of course, to have laid before him a bill that he can sign without breaking any promises. It seems to us that it would be well for the House Republicans to be assured in some way that he still prefers revision downward, or at least is opposed to revision upward. The President knows that if he should sign such a bill as the Republican conferees desire to make, he would inevitably suffer in public estimation. He knows also that his party would be affected seriously, altho in the absence of a strong and consistent Democratic party the injury would not be mortal. For his own sake and for the good of his party,

well as in the interest of the people, he should strive in all honorable and permitted ways to improve the projected revision. At this late day, however, but little improvement can be made even by the exertion of his powerful influence.

Our Alleged Contribution to Civilization

THE other day an interesting commencement address was delivered at the University of Wisconsin by the Brazilian Ambassador to the United States, Joaquim Nabuco. The theme was, "The Share of America in Civilization," and we dare say that most readers who saw it mentioned in the newspapers felt a certain half-idle curiosity, perhaps for the first time in their lives, concerning the ideas that an intelligent observer from the southern American continent might hold on this subject. We profess to have ceased to care what Englishmen, Frenchmen and Germans think about it. They can't mentally grasp us, it seems, and, of course, they are too set in their *a priori* notions to see us as we really look. But a South American is different. His own civilization, it stands to reason, is not yet "effete." He has been brought up under a republican form of government, and, anyhow, he lives west of the Atlantic Ocean. He might just happen to see us from an angle that offered a fairly advantageous and recognizable view.

The possibility is strengthened by the bias revealed in the Ambassador's opening remark. It appears that once in going from Europe to Brazil, Mr. Nabuco was taken by surprise to hear a fellow-passenger, the late distinguished traveler, William Gifford Palgrave, ask the captain of the ship what good had come from the discovery of America. For his part, Mr. Palgrave could not think of any original American contribution to human well-being except tobacco. We need not raise the question whether civilization can be said to have existed before the invention of cigars. It is enough to drop the reflection that Mr. Palgrave revealed his intellectual limitations.

Perhaps, however, it is no worse to be supercilious and circumscribed than it is to be unduly serious, expansive and naive, as it must be acknowledged President Eliot seems to have been when he propounded the thesis that, over and above tobacco, America had made the following five contributions to civilization, namely: "First, and principal, the substitution of discussion and arbitration

for war as the means of settling disputes between nations; second, the widest religious toleration; third, manhood suffrage; fourth, the demonstration of the fitness of a great variety of races for political freedom; fifth, the diffusion of material well-being among the population." When we remember that the diffusion of well-being among the population has only just been attended to by the Senate, and may have to linger in conference; that the demonstration of the fitness of a great variety of races for political freedom remains incomplete; that manhood suffrage was invented by Frenchmen, instead of by Americans; that religious toleration began in the Macedonian empire and became European under the imperial rule of Rome; and that the first prize for the substitution of arbitration for war has not yet been awarded, we can but admire the gracious courtesy and the diplomatic language of the Brazilian Ambassador when he puts his only comment upon President Eliot's dissertation into the remark:

"I do not think all the points claimed as American contributions by President Eliot will bear in history the mark—'Made in America.'"

What, then, if anything, have we contributed to civilization—always bearing in mind, of course, tobacco? Mr. Nabuco's answer, if not entirely convincing, is at least not absurd. It reveals a bit of real thinking on the subject, and is worth thinking about.

In his view, our supreme contribution to civilization has been our creation of a unique population and national type by mixing and assimilating all nationalities so far that they speak a common language, with all that this implies of unity of thought and feeling. This, he reminds us, has never been done before. For while the Roman Empire combined many nationalities in a common political system, it did not create a common language. This unique population has been created by immigration, and that means that it has been "formed by self-selection." It is the Ambassador's opinion, moreover, that it is our "ever-changing ethnical composition" that keeps up our individuality.

Next to the assimilation of varied ethnic elements in a new national type, Ambassador Nabuco believes that our great contribution to civilization is a distinctly

American kind of democracy. No one would claim that America invented democracy, but doubtless it is true that American life and conditions have imparted new vitality to the democratic idea, and perhaps have contributed something of an experimental sort toward demonstrating its practicability. Taking the trouble to expose Professor Münsterburg's curious contention that American democracy was derived from eighteenth century European philosophy, Mr. Nabuco lays emphasis upon the well-known circumstance that not only were French revolutionary principles taken from America, but that also the mind of Jean Jacques Rousseau was deeply stamped with New World impressions.

Without formally including the Monroe Doctrine among America's contributions to civilization, Mr. Nabuco incidentally speaks of it as such. He believes that it has been a powerful influence in keeping the peace of the world.

Upon these interesting views of a keen-minded and gracious observer we can make no further comment than to express the hope that they may turn out to be true. We think that Mr. Nabuco has come a little nearer to a true understanding of us than most of our visitors have done. And yet, in view of all the things that haven't yet happened, we are disposed to state our own predictions in the cautious language of a certain sagacious Roman citizen: "It doth not yet appear what we shall be."

The President's Straw Hat

THE dignitaries gathered for the Champlain festival clad in black suits and tall silk hats, such as express dignity and provoke comedy. They sweltered and were uncomfortable, and looked miserable. President Taft wore a cut-away coat and a straw hat. The next day the fashion had changed. Dignity remained, with genuineness, but the show of dignity had passed away; the visiting statesmen had recovered their straw hats and gray suits, and there was ease and comfort. That was reasonable; that was sensible. The example of the President accomplished it.

But there were only President and Governors and Senators and such com-

men told at this celebration. For two or three weeks before, at a hundred colleges and universities, some ten or thousands of presidents and professors and graduating students surrendered their native simplicity and tagged and togged themselves in unusual accoutrements to make it evident to an admiring or doubtful world that they were distinguished, or at least might be distinguishable as scholars. As if their broadcloth coats were not warm enough, they swathed themselves in folded lengths of black silk and velvet, and topped their heads with odd square black boxes, from the side of which dangled and swung a goodly tassel, all of which declared, if it could not prove, the wearers to be paramount possessors and dispensers of knowledge. And as if the assumption of these cumbersome habiliments were not protection enough against the midsummer's sun, they invited dozens of other men, whose custom of liberty had escaped these incommodious garnishments, to join for the nonce in their display, to accept fresh literary fardels, assume thru the tedious hours of the commencement stage the same toggery of academic distinction, and receive added burden of drapery. The candidate rises; he listens to the recital of his merits; the college president hands an apparitor a marvelous contrivance called a hood; he walks behind the amused candidate and swings over his head (it catches in his chin) the wide band that holds the thing on his shoulders, and a great, wide pocket lined with brilliant colored silk open in gorgeous grandeur on his back more clothes, more weight, more show, more glory of sapphire, saffron and roseate robes for conscious and blazoned worth.

Does the tailor make the man? Oh, no! He displays the man. The modest scholar has no love for it all. But he is a patient beast and carries the burden put upon him. He endures and suffers in silence, like the henpecked benedict:

"Thou shalt be
 a simple good natured little fellow-legged stool,
 To paint your face and use you like a fool."

Why will they stand it? Cannot the show be tamed? To our sense the function at Plattburg was more decent and dignified. It was not ridiculous. Give us more Presidents like Mr. Taft.

Mediumistic Revelations

BERNARD SHAW advocates having fortune-telling made a compulsory study in all the public schools, for the reason that it teaches the essential similarity of human nature. There is much to be said in favor of this novel proposal. Fortune-telling is an easy art and a profitable profession. How easy and how profitable we can see at any summer resort by noticing the number and mental caliber of the astrologists, palmists and mediums who occupy the long lines of booths. It is obvious that not all of these can have had the advantage of gypsy blood, of being born with a veil, or of being the seventh son of a seventh son. They have not all been endowed by nature with supernatural powers. They have acquired their skill in the same way and with as little difficulty as the man who blows glass or the woman who plays catch with butcher knives in the tent next door. Yet for a dollar or two (or fifty cents if the crowd is slim) they will analyze your character, reveal your secret ambitions, recall to your mind forgotten incidents, and tell more of your habits than you are willing your friends should overhear. This is always startling and uncannily impressive, even when awkwardly done, and it is impossible to explain it by any known natural laws.

The reason why it cannot be explained is, in our opinion, because there is nothing to explain. Why is it, to pass on to the next booth, that a man who does not know how to shoot takes the target rifle that his friends thrust into his hand, puts it to his shoulder, shuts both eyes and hits the bull's-eye, thus beating the record of the best marksman in the party? Why is it that in the crowd of 10,000 people you meet the classmate whom you were just thinking about but had not seen for years? Why is it that you put your hand by chance on a volume in the box in front of a book stall and, opening it, find the quotation that you tried to run down all last week? Why ask why? No explanation is needed. The chances may be a million to one against any of these things happening, but they happened, and that is all there is to it. The bullet when it left the muzzle of the gun had

to strike somewhere, and the chances of the bull's-eye for being hit were just as good as any other spot of equal area in front of the embarrassed marksman. That is, the law of probabilities gives us no help whatever in regard to single occurrences, and their evidential value accordingly is nil.

Not far from a fortune-teller's booth there is usually to be found a man with a scale who offers to guess your weight for a nickel, "no pay if I don't come within three pounds." He hits it often enough to make a living. A few years ago rain-makers were common in the arid West. The wizard would come into a community and offer to bring rain in ten days for \$5,000. This was a bargain price for water, and the people subscribed readily until it happened to occur to them that the rain-maker was simply making a bet with a community on its raining within ten days without putting up any stake himself. If the rain came he got the \$5,000. If it did not he had lost nothing except in time and reputation, neither of which was of much value.

The revelations of Mrs. Piper, which so impress Dr. Hyslop and Professor James, seem to us no more to require explanation than the successes of the rain-maker, the weight-guesser or the tent fortune-teller. The physical manifestations of Eusapio Paladino, which convince Professors Lombroso and Schiaparelli are no more inexplicable than the marvels of any conjurer. We have known a school girl at a church fair, whose gypsy finery was borrowed for the occasion, and who had never held a palm in her hand before, at least for such a purpose, to make as marvelous hits in reading the minds of her unknown clients as any that we have read of in the Proceedings of the Society for Psychical Research. The most startling and inexplicable cabinet and materialization work we have ever witnessed was done by a patent medicine man in broad daylight on the street corner.

Mrs. Piper talks a great deal of nonsense and says many things that are not so. Everybody admits that. What credit shall we give her when she says something that is so? Eusapio Paladino cheats sometimes. Everybody admits that. The question is whether she is

cheating when she does the same thing at times when she cannot be caught at it. Now, the claims of the weight-guesser in the pleasure park could be put to a scientific test if it were worth while. Knowing what he is going to do, precautions could be taken in advance to insure that he did not cheat by keeping his hand on the scale beam, etc., and a long series of his guesses compared with the verified weights of the persons experimented upon would tell whether he had any superhuman power or unusual skill at estimating the weight of human live stock on the foot. The reason why we could test his methods and powers is because a definite question is put to him, which he never evades or refuses to answer. If you ask him, "How much do I weigh?" and he says "165 pounds," which is exactly right, it does not prove him to be a mind reader or rapid calculator, because that number is as easily hit upon as any other number, but since the chance that an unskilled guesser would hit upon that number is only about one in twenty, his accuracy is startling and might lead you to invest further nickels in testing his ability on the others in your party, and by a sufficient number of tests you could find out exactly how much better he was at guessing than the ordinary man. But if, when you ask him "How much do I weigh?" he answers, "You had a little sister named Mary, of a lovable disposition, who died young of measles," which is quite true, the reply is even more startling, but does not indicate supernormal powers as much as if he had said, "165 pounds." Even if you should find out how many men on the average had lovable little sisters named Mary who died of measles, and should determine that he had only one chance in a million of hitting upon such an incident in connection with you, it would prove nothing, because the law of probabilities has no application to a single event or to a miscellaneous lot of events of different kinds. That is, you can always hit some particular spot, however small, with a target rifle, if you do not have to tell in advance which particular spot you intend to hit. It is easy to perform marvels if you do not tell the audience what marvel you are going to perform. It is easy to answer hard ques-

ness if you are allowed to give the answers, and for other people think up the questions to fit their apprehensions. Any necessary could pass an examination under such system.

Now, mediums in general, and Mr. Piper is no exception, dodge simple and direct questions, and instead provide more or less vague information on various subjects, often entirely foreign to the matter or person inquired about. The information so proffered may be quite correct, but even then it gives little indication and no proof whatever of the possession of supernormal powers. Materialization mediums in general, and including Eusapio, act like conjurers in that they do the unexpected. When the people in a seance room are expecting the table to rise the guitar in the cabinet plays, and when they are expecting music, they get their noses tweaked.

The reason why Moses was not able to soften Pharaoh's heart was because the miracles he performed to substantiate his divine commission could be done as well by the magicians in Pharaoh's own employ. The reason why the reports of the Society for Psychical Research fail to convince the general public is because the things that the visitors from spirit land say and do are the same as ordinary fortune-tellers and conjurers are able to say and do under similar circumstances.

Since fortune-telling is not taught in the public schools, try it for yourself if you are interested in the subject. Ask your friends to bring you their most remarkable letters in sealed envelopes. Arrange your seance accessories as effectively as you can to impress them and yourself—lights, music, furnishings, costumes, ceremonial and all the rest of it. Put the letter to your forehead and just talk. Talk as if you were shooting at a burglar in the dark, wildly and rapidly. If you are ingenious and fluent you will make some surprising hits. In a short time, with ordinary luck and encouragement, you are likely to become convinced that you are about as good at it as any medium or mind reader. Next, you will deduce the complemental proposition that no medium or mind reader has any more supernormal powers than you have. Then you can drop the business and get at something more profitable.

The Age of Aviation

We have previously discussed the effect of general aerial navigation on our tariff system. An article in *The International* extends the discussion along various lines. The subject is opened for general treatment by the proposal for an international commission between France and Germany to lay down the rules of the air. Already serious disagreements have arisen between the two countries, in part from fear of the spying of fortifications, and in part from the heavy tariff duty levied in France on German airships that have landed across the border.

A French writer, Professor Richer, has in a volume studied the effect of aerial navigation on customs imposts. He holds it as certain that there will be no way to prevent the smuggling of light and costly objects. A prohibition for aeroplanes to cross the frontier would be futile, for it would be impossible to detect them on a dark night; and it would not be necessary that they should land, as a bale of silks could be dropt at a designated place where it would be taken by a confederate far away from custom houses. This practice, not easily prevented, will tend to spread the doctrine of free trade. It will help President Taft's urgency for an amendment to the Constitution allowing an income tax.

The proposal of the last Hague Conference to forbid the dropping of explosives from balloons, etc., has not, we believe, been accepted by all the states. In the case of a life and death conflict between two nations it is hardly to be expected that they will refrain from any means in their power. To enforce a prohibition would be infinitely difficult. In case the guarding against explosives dropped from aeroplanes becomes necessary all fortresses and warships will have to be protected from above as well as on the sides, and this will involve a very difficult problem. The danger will be vastly increased to cities; for on any dark night a fleet of airships might fly a hundred miles across the border unperceived, and suddenly throw inflammables, phosphorus and petroleum on the roofs of houses, with immense destruction to property, and to the lives of non-combatant women and children. In case

of a war between any of the European nations not a mile of their territory would be free from the danger of invasion; for, as the writer in *The International* says, "For airships that can mount unperceived on dark nights to any altitude there are no frontiers, no barriers or lines of defense."

What, then, will be the effect of the use of airships on the maintenance of the military system of states? When war becomes so dangerous to those that take part in it, there will be increased unwillingness to engage in war. It must also be considered that aeroplanes are cheap. A small nation can afford no adequate navy, but it can on short notice equip a thousand airships. This tends to equalize the smaller with the larger powers. The claim of Señor Barbosa, the Brazilian representative at the last conference at The Hague, for equality in international courts thus is strengthened. The strong powers will be slow to declare war even against a weak power, when the latter can do it infinite harm. The age of aviation may thus be the age of peace.

Apart from these political and international considerations there are those of a more social and personal nature that deserve consideration. The trolley has been many times extolled as the means by which the city is moved out into the country, and country life becomes possible to millions of those whose day's business is in the city. But what the railroad and the trolley do the airship may do still better. A man may own one, as he now owns his bicycle; or regular relays of aeroplanes may take the busy workman or clerk every morning and evening to and from his healthy dwelling far away in the country.

The use of the airship will greatly facilitate travel. Families will take journeys in their own vehicles to foreign lands or to distant parts of their own country. Already the balloon is being prest into service for the exploration of the North Pole, but there are other portions of the globe that will be best reached in this way, such as mountains, forests and deserts, for research or as health resorts, quite inaccessible at present.

The world has always prayed for the wings of a dove to fly away and be at rest. Accordingly it invented all sorts

of winged gods, angels and spirits that could move freely thru the air. An old Persian story tells of the wicked king who made him a carpet on which he sat, and he attached to its four corners four mighty eagles and placed before them meat just out of their reach, so that they would fly away after it. A vastly older Babylonian story has come down to us, in art as well as in mythologic tale, of Etana, the strong one, who mounted on the back of a monstrous eagle, like the roc of the Arabian tales, and flew up and up, until the oceans looked like puddles, and he reached the successive heavens of the gods. We do it in a different way from all these, and from the unlucky Icarus of the waxen wings that melted too near the sun. The new invention will add much to humanity, but will cost a multitude of lives lost like that of the son of Dædalus, who

"Essayed the empty air

With wings not given to men

No task is too hard for mortals

In our folly we assail heaven itself.

And our sacrilege forbids

Angry Jove to lay aside his bolts."

More truly than when Horace said it:

"Nil mortalibus ardui est."

but in every new conquest of the elements we see a proof that the God of nature is our beneficent friend and we discover no sign of the jealousy of Jove.

An Invitation Accepted

EIGHT weeks ago we sent to our entire list of subscribers an announcement of the prospective increase in our subscription price, with an invitation to them to send us their five-year renewals at the old price. They will like to learn the result, and we are glad to tell them, for it greatly pleases us.

An outsider well versed in magazine affairs predicted a failure, and stated that we would be fortunate if one per cent. responded favorably. He argued that people take too many magazines nowadays to concentrate their interest on any one, and that nobody had faith enough in any magazine to subscribe for five years in advance. We believed, however, in the loyalty of our friends and the letters were mailed.

The first week we received one answer, from a man whose name will always be remembered in our office. A

poor start made a good ending, for the second week we received 413 replies and thereafter at a continually increasing rate until over 12 per cent. of our entire list had accepted the five-year offer. With the renewals we received many cordial letters, which we wish we had the space to print. The experience proved that our subscribers believe in the work we are doing and are prepared to lend us their support.

We realize that we do not appear in a coat of many colors, and that we do not print stories and pictures merely to amuse. Our magazine will never be a popular million-a-week journal of the hour. We have other purposes than to coin hasty money, and are devoting our attention to problems on which we feel there is the need for strong and fearless expression. To realize by conclusive evidence that we have the support of our subscribers is a great incentive and a source of peculiar satisfaction.

The General Education Board

The Rockefeller Foundation of the General Education Board has received an additional grant from Mr. John D. Rockefeller and now amounts to the immense sum of \$53,000,000. The income, which will reach not less than \$2,000,000 a year, is distributed, according to the best judgment of the trustees, to colleges and universities, according to their special needs, and in smaller part to institutions of a lower grade. Usually the grant is conditioned on two or three times the sum being raised from other sources. This puts a fearful strain sometimes on the president and friends of the college, but it is well that institutions should rest on the good will of the public and not lie down on an easy benefactor. Doubtless the rule is, Ask, if ye will receive; but also the rule applies to the trustees of the Board, Seek if ye will find where the need is greatest and the most good can be done. Some of the institutions that have received aid are in the limelight and have many friends. Such are Harvard, Yale and Princeton. Others are the smaller and younger promising colleges in the West and South. Particular consideration should be given to the institutions of the highest scholarly rank and ambition that are de-

voted to a class that has few wealthy members, and might find it impossible to raise three or even two dollars for one given. We would also ask attention to American institutions in foreign countries, which in the renovation of society are doing vastly more, with the smallest means, than any corresponding schools can do in this country. We give Mr. Rockefeller credit for the desire to make his enormous wealth useful to the world. He has done well to put so much of it into the control of a strong board, who can decide better than he can what institutions are worthy. We have no fear they will make mistakes in their selections; only that equally worthy or even more worthy will be overlooked. On one occasion, when Mr. Rockefeller made his own personal gift to certain mission colleges in foreign lands, a clamor condemned the gift as "tainted money." Even fastidious consciences will hardly object to receiving money that no longer belongs to him, and that does not bear his name. It is peculiar to him that he perpetuates his name nowhere. Gifts made by this Board are absorbed with other gifts in general funds; and the Education Board itself is allowed finally to distribute its millions and dissolve and leave no name behind. But it will leave behind a train of influence that can never cease to be a blessing to this and, we hope, other countries.

British Millionaires

In England it is the big millionaires who are joined to defeat, if money can do it, the budget presented by Mr. Lloyd-George, and which it is expected that the House of Lords will reject, against all precedent. This will mean appeal to the country, or might be expected to. There was a great meeting of the rich men in London to protest against the budget, and there were Lord Rothschild, Lord Avebury, banker and scholar, Sir Felix Schuster, and others of similar wealth. There is a sort of resentment in the criticism which Mr. Lloyd-George makes of the attitude of Lord Rothschild. He refuses to bow down in deference to his lordship's wealth. He says:

"Really in all these things we are having too much Lord Rothschild. I should like to know is Lord Rothschild the dictator of this country?"

Are we to have all ways of social and financial reform blocked simply by a notice board, 'No Thorofare. By order, Nathaniel Rothschild?' There are countries where they have made it perfectly clear that they are not going to have their policy dictated merely by great financiers, and if this goes on this country will join the rest of them."

Possibly he referred to this country. It is precisely the same interests that in Great Britain declare it robbery to impose death duties and to tax increments of land value in case of sale which in this country are opposing corresponding legislation urged by two Presidents. Money talks—and smells when it talks in this way.

Who Is Father Fonck?

The new Pontifical Biblical Institute established at Rome by the Holy Father will have as its president Father Leopold Fonck, of the Jesuit order. This Institute, or university, is intended to show the devotion of the Church to biblical studies, as against the perversities of modernistic criticism. Father Fonck is praised as a profound biblical and Oriental scholar. The record given—for he is not much known to the outside world of scholars—says that he was born in 1865, and so is quite a young man. From the age of eighteen till twenty-five he studied at the Gregorian University at Rome, and there won his Ph. D. He then taught for two years in a boys' school in Westphalia. At the age of twenty-seven he entered the Jesuit novitiate and gave himself to Hebrew and Old Testament versions. He then traveled in the East and followed his visit there by three years in the universities of Berlin and Munich, studying Egyptology and Assyriology, and wrote articles for a Bible dictionary and other papers. In 1901 he was made Professor of Oriental Languages and Sacred Archeology in the University of Innsbruck. His publications, however, do not seem to be so much scientific as popular and apologetic. Such are his "The Explanation of the Gospel Miracles" and "The Struggle Against the Truth of the Scripture." We have looked thru the last few years of the *Orientalische Bibliographie*, and apart from the volumes mentioned his name does not seem to be included except for several book reviews.

He does not seem as yet to have secured recognition as a biblical or Oriental scholar. One wonders, or, rather, does not wonder, why a recognized Catholic Oriental scholar, like Lagrange, was not selected. But all such men have been attacked and are under suspicion. Dr. Fonck is "safe," a chief merit.

We suppose kings can be millionaires in their own right—such is King Leopold of Belgium. But this implies a constitutional form of government, or inherited wealth. Just how to consider the \$200,000,000 which the Sultan Abdul Hamid is said to have deposited to his name in foreign banks it is not easy to say. He was an absolute monarch and claimed the right as such to do what he pleased with the taxes squeezed out of his subjects. But was it his, or does it properly belong to the nation? The present rulers take the latter view and are squeezing it out of him, and hold him in their hands that they may squeeze the better. He is said to have large deposits in this country; but we doubt if any bank will honor any draft not made by him as depositor. If the Turkish Government brings suit for the money it will raise some very large questions of the authority and rights of rulers.

Gen. Fred D. Grant said the other day:

"The army by all means ought to be placed at 150,000. We ought to have at least twenty more regiments of regular infantry for immediate training and 600 more officers. All this has been pointed out to Congress, but they are decidedly slow to act."

And why should we have an army of 150,000 men? It has been so "pointed out to Congress," it is true, but the main reason is to magnify the army. That is the army should be bigger that it may be greater, not a conclusive argument. The army is not an end. The aim of civilization is to expunge the army. We make no objection to increasing the number of students at West Point who may go into civil life and be called on in case of war, but we hope for reduction and not increase of the army. The fifty thousand added to the army would be so many taken from productive industry and to be supported by increased taxation.

The leader of American astronomers, mathematicians, not to say of science generally, Prof. Simon Newcomb, died last Sunday. Astronomy is peculiarly an American science, and Professor Newcomb may fairly be said to have been the most distinguished astronomer in the world. He worked to the last, finishing his reconstruction of the theory of "The Motion of the Moon" only a few weeks before his death, which he knew was imminent. He was a simple, unaffected scholar, and was more than a mathematician, for he was devoted also to problems of philosophy, and THE INDEPENDENT has been enriched by a series of articles by him along these lines.

In spite of the veneer of Western civilization which Japan has acquired, the people have not altogether freed themselves from their former barbarous customs and primitive ideals of morality. For example, Dr. Sako, the former president of the Japanese Sugar Trust, has committed *hara-kiri* merely because the company under his management has been convicted of fraud and graft. We would call the attention of the Japanese to the fact that our Sugar Trust has been found guilty of much more culpable practices and yet none of its officers has lost his courage, his self-respect or his standing in the community.

The advantage which France has over Great Britain is in the large number of small landholders, who are, as in any country, the best part of the people. It is an advantage of the new British budget that it puts such burdens on large estates that the owners will be inclined to part with them. An Irish peer, Lord Darnley, has advertised an entire town owned by him in County Meath for sale, because, he says, the new budget will wipe out the profits of agriculture. This is one of the advantages hoped for. That was the intention.

Bishop McManis repeats his attacks on all State and non-Catholic colleges and schools. The Catholic Church, he says, has saved the Bible. We did not know

it had been in danger of being lost. He declared that the Catholic Church is at war with so-called science as it exists in American colleges, and that the Church would have been led a merry gait if it had attempted to keep step with the statements of science and evolution. If it does not follow the conclusions of science and evolution it will be led a sad gait; but it will follow discreetly, if somewhat laggingly, as it did in the case of Galileo.

Will the readers of THE INDEPENDENT excuse us from repeating for the thousandth time the history of the achievements of John Calvin? It is in all the encyclopedias, and the Church and the world both gave him honor, and both hold no further interest in the "five points" which split Protestantism. What were they? Who remembers? But, Servetus notwithstanding, he was a great and good man, one of the molders of the world.

To combat the ravages of the gypsy or browntail moth, Dr. L. O. Howard, Chief Entomologist of the Agricultural Department, has begun the importation of parasite-bearing caterpillars. It is to be hoped that these parasites will undo the damage that resulted in New England and elsewhere when the careless investigator permitted his imported moths to escape.

A correspondent wants us to comment on the policy of a town in Texas which will not allow a colored person to remain within its limits over night. We have heard of one or two such towns in Northern States. No defense can be made for such barbarity. To call it unchristian would be to use too mild a word. Such places show more hostility.

Mr. Rockefeller and Mr. Carnegie have each given away to the public much over a hundred million dollars. And in each case the distribution has been well made and they have the satisfaction of seeing the good done during their life.

Insurance

Fire Waste and Fire Protection

THERE is something very thrilling about fire fighting. Every one is excited when a fire engine of the modern type dashes down the street, driver strapped into his seat and bells clanging. The horses seem to enter wildly, often with something approaching frenzy, into their portion of the task. The cost of maintaining the very elaborate fire departments that now exist in all of our cities is very great, but it has been held that the end justifies the means, and when a fire engine gets into action it often does magnificent work. If the fire loss grows into figures that are at once melancholy and appalling with all of our fire fighting equipment, what would it be if we had only the bucket brigade of the olden days? According to one recent authority, the cost of fire and its accessories is now, in round numbers, something like \$600,000,000 per year, which is approximately equal to the annual building value produced. Every one ought to be extra careful in order to reduce this frightful fire waste.

FLIES and mosquitoes are by no means negligible hazards. A Brooklyn man having been bitten by a mosquito last month, blood poisoning set in and the despised mosquito might have bitten the man to death. As the Brooklyn man happened to be insured he got \$14 from his accident company as a consolation prize. Over in New Jersey the other day Sergt. Clinton B. Higgins of Trenton, a member of the National Guard, was shooting with his team on a rifle range. A fly bit him, but he was so interested in scoring that he neglected to brush the fly away. Once more blood poisoning developed and the gallant guardsman is

liable to lose his arm thru the agency of the biting fly. Peace hath her casualties no less renowned than war.

A MODERN FIRE ENGINE RESPONDING TO A FIRE ALARM.

EX SENATOR JOHN F. DRYDEN, president of the Prudential Insurance Company of America, estimates the insurable population of the United States at 55,000,000. Out of this great number, however, only about one out of eleven lives is insured. If these figures were based upon "adequate insurance" the proportion of the uninsured would be much larger. In view of these facts it would seem that the insurance agent should not be led into thinking that his field is narrow. The agent who thinks out original methods and applies them in the insurance field works almost without competition.

INSURANCE ON USE and occupancy will be novel to many of our readers, but the application of the insurance principle grows and the form of insurance to which attention is here directed is in considerable and growing favor in Chicago. The desirability of such protection will appeal strongly to those who are interested in the subjects of use and occupancy. Recent litigation over the use and occupancy of the Grand Pacific Hotel in Chicago has directed particular attention to such insurance.

A MISSISSIPPI institution organized to give marriage benefits and benefits upon the birth of children, in addition to the more ordinary health and death benefits, has been refused permission by Commissioner Henry to do business in that State. The managers were negroes. Societies of a similar type, most of which were fraudulent, were common in Mississippi some years ago, and it was to prevent fraud that a permit was refused.

Financial

A Good Crop Report

THE July crop report of the Department of Agriculture, issued on the 8th, was highly favorable, especially with respect to corn. Our largest crop of corn heretofore has been 2,927,416,000 bushels, in 1906. But there is fair promise that this year's crop will be 3,161,174,000 bushels. This is the Produce Exchange's estimate, based upon the department's figures for condition and acreage. The area of the corn fields this year is 109,006,000 acres, against 101,788,000 in 1908, an increase of a little more than 7 per cent. The growing plants are in fine form, the condition percentage for July being 89.3, against 82.8 one year ago, and a ten years' July average of 84.8. A great crop of corn is of much importance to meat and dairy interests, and is regarded with satisfaction by railroad companies. Winter wheat's condition improved (from 80.7 to 82.4) during the month preceding harvest. Therefore the decrease (due to winter killing) from last year's yield will be only 28,000,000 bushels. Spring wheat's condition, 92.7, is still exceptionally high, for the ten years' average is only 87, but there has been a slight decline since June 1. The entire crop of wheat promises to be within about 1,000,000 bushels of last year's. Condition percentages for oats, barley, rye and potatoes are high and considerably above the ten years' average. The crop of oats will probably exceed last year's by 150,000,000 bushels, or by nearly 20 per cent., and the yield of barley will be increased by 10 per cent. Indicated yields, in bushels, are shown below, with the crops harvested a year ago:

	1909.	1908.
Corn	3,161,174,000	2,927,416,000
Winter wheat	902,700,000	874,700,000
Spring wheat	253,700,000	240,000,000
Wheat, total	1,156,400,000	1,114,700,000
Oats	962,933,000	807,156,000
Barley	183,723,000	166,756,000
Rye	31,000,000	31,851,000
Total	5,094,281,000	4,330,078,000

Secretary Wilson's estimate of the value of last year's farm products was

\$7,778,000,000. Owing to the increase in quantity and to higher prices, the total this year may exceed \$8,000,000,000.

General confidence and the progress toward complete recovery from depression have been stimulated by this report. In connection with it may be considered the June output of pig iron, which was 1,929,884 tons, against 1,883,330 in May. In the first half of the year, the output was 11,000,000, against 9,018,014 in the preceding six months, and only 6,918,004 in the first half of 1908. The furnaces are producing iron now at the rate of 24,000,000 tons a year, and there is a good demand for all of it, at rising prices.

....The International Harvester Company announces a plan, resembling that of the Steel Corporation, for the purchase of stock of the company by employees, payment to be made by installments taken from wages. For this project 12,500 shares of preferred and 15,000 shares of common stock have been set aside. These shares are offered to employees at prices considerably below market quotations.

....The suggestion that a Pan-American bank be established in New York, with agencies in Central and South America, has been so favorably received by capitalists and the governments concerned that the organization of the corporation within a few months is expected by the Bureau of American Republics.

....British capital applications in the first half of the present year amounted to £121,073,600, against £100,673,500 in the first half of 1908, and only £123,630,000 in the entire year 1907.

....Gross earnings of the railroads for June, according to the *Financial Chronicle's* returns, showed an increase of 10½ per cent. over those of June a year ago.

....The Japanese shipping subsidy law, as recently amended, provides for the payment of \$20,173,992 in steamship subsidies during the next five years.

The Independent

VOL. LXVII NEW YORK, THURSDAY, JULY 22, 1909

No. 3164

Survey of the World

Mr. Taft Insists Upon Tariff Reductions

After the tariff conference committee had settled down to its work, the President began to exert his influence in favor of such reductions as still could be made. Members of the committee and others in the Senate or the House were invited to confer with him at the White House. Mr. Aldrich and Mr. Payne were his guests there, and the President heard Mr. La Follette's arguments. He began these conferences on the 12th. Those who talked with him were told that he wanted to see iron ore, hides, coal and petroleum on the free list. On the 16th a party of twenty-three Representatives (twenty-two Republicans and one protectionist Democrat) called at the White House to protest against the removal of the duties on these raw materials. They did not induce him to change his attitude. After their departure the following statement was issued at the White House by his authority:

"Mr. Young, of Michigan, opposed free ore; Mr. Mondell opposed free coal or reciprocity with Canada, and free hides—each on the ground that the policy would injure the interests in his State; and a discussion was participated in by other Representatives, who urged that the doctrine of free raw materials was not a Republican doctrine. The President replied that he was not committed to the principle of free raw material, but that he was committed to the principle of a downward revision of the tariff, which he had promised, and that he was obliged to look at the matter, not from the standpoint of any particular district, but from the standpoint of the whole country, and also from the standpoint of responsibility for the entire Republican party. He said the question in each case was a question of fact, to be determined by evidence as to whether the present duty was needed for protection or whether the rate was excessive, so that downward revision or putting the article on the free list would not injure the industry.

"He repeated the platform of the Republican party and said he had always understood that it meant a downward revision in many instances, tho perhaps in some few instances an increase might be needed; that he reached this construction of the platform on what he understood to be the principle of protection and its justification—namely, that after an industry was protected by a duty equal to the difference between the cost of production abroad and the cost of production in this country, including a fair profit to the manufacturer, the energy and enterprise of American business men and capitalists, the effectiveness of American labor and the ingenuity of American inventors under the impulse of competition behind the tariff wall would reduce the cost of production, and that with the reduction in the cost of production the tariff rate would become unnecessarily high and ought to be reduced. This was the normal operation of the tariff as claimed by the defenders of the protective system—not in every case, but as a general rule. Of course a revision of the tariff could not be perfect, but must have defects and inconsistencies; but, so far as his influence went, when called upon to act in connection with legislation, it would be thrown in the direction of performing the promises of the party as he understood them, and that if iron ore and oil and coal and hides did not need protection and the conditions were such as to enable the ore producers and the oil producers and the coal producers and the producers of hides to compete successfully, without reduction of wages, with the producers from abroad, then they did not need a duty and these articles should go on the free list. It was a question of fact which he hoped to make up his mind with respect to, on such evidence as was available to him, in order to carry out what he understood to be the promises of the party to the whole people.

"He said he felt that his position as the titular head of the Republican party and as President, with the whole people as his constituency, gave him a somewhat broader point of view than that of a single member of Congress in respect to articles produced in his district. He felt strongly the call of the country for a downward revision within the limitations of the protective principle, and he hoped to be able to respond to that call as he heard it, as well in the interest of the party as of the country."

Mr. Taft has received many letters and

telegrams commending his attitude. At the end of last week, Mr. Aldrich said that those provisions as to which the committee could not agree would be referred to him, but that he must procure the votes needed for the approval of his decisions by Congress. It was understood that the House would stand by the President with respect to the duties he had mentioned, and would reject any conference report which did not meet his requirements, even going so far as to defeat the bill if the committee should finally refuse to report in accord with his views. But nothing was said about the increases in the cotton goods schedule and other parts of the tariff, or of the new method of valuation.—The committee, at its sessions, accepted the Senate's administrative provisions (including the maximum rates) and restored the salaries originally provided for the Customs Court. It was also agreed that provision should be made for an issue of bonds, with interest at not less than 3 per cent., sufficient for the entire cost of the Panama Canal (estimated by Colonel Goethals at \$397,000,000), with the understanding that \$50,000,000 should be used to reimburse the Treasury for the purchase of the canal rights and property, because the Treasury's working balance is not large enough and is falling.

Income and Net Earnings Taxes

In the House, on the 12th, the Senate's resolution for an income tax amendment to the Constitution was adopted by a vote of 317 to 14, after a four hours' debate. Those who voted against it were as follows:

Allen, of Maine; Gardner, McCall, and Weeks, of Massachusetts; Henry and Hill, of Connecticut; Abbott and Sutherland, of New York; Barchfeld, Dalzell, McCreary and Wheeler, of Pennsylvania; Caldwell, of Kansas; Fordney, of Michigan.

Four of these are members of the tariff conference committee. Democrats asserted that the resolution had been stolen from their platform. The leading speech against an income tax was made by Mr. McCall. Mr. Payne, chairman of the Ways and Means Committee, said he was utterly opposed to the general policy of such a tax, but thought the Government should have power to tax incomes in time of war. He hoped such a tax would

not be imposed in time of peace. Mr. Bryan has published the following letter, addressed by him to President Taft:

"Now that the States are going to vote on the ratification of the amendment specifically authorizing an income tax, why not give them a chance to vote on an amendment providing for the election of United States Senators by popular vote? In your speech of acceptance you said that you were personally inclined to favor such change in the Constitution. Would this not be an opportune time to present the subject to Congress? Two Constitutional amendments, one authorizing an income tax and the other providing for the popular election of Senators, would make your Administration memorable, and I pledge you whatever assistance I can render in securing the ratification of these amendments."

It is reported that Governor Johnson will call a special session of the Minnesota Legislature to vote upon the proposed amendment.—It is known that those Republicans who are most influential with respect to the tariff revision do not like the tax on corporation net earnings. They have been in conference with the President, who urged the adoption of the tax by the committee. Thereafter they supported the proposition, and the acceptance of it is probably assured. Many protests have been received from officers of insurance companies and of other corporations, who hold that the tax is an inequitable one. The paragraphs relating to it, as passed in the Senate, are undergoing amendment in the Department of Justice. It is reported that some persons connected with the Department fear that the tax, if imposed by Congress, will be pronounced unconstitutional by the Supreme Court. It is estimated that the revenue, at 1 per cent., would be about \$25,000,000, and that the largest payments would be made by the Steel Corporation and the Standard Oil Company. About two-fifths of the total would be paid by the railroads.

Strike Riots in Pennsylvania

An unforeseen strike, which has been marked by riot and bloodshed, was begun on the 13th by the employees of the Pressed Steel Car Company, at McKee's Rocks, six miles below Pittsburgh. The men are not members of a union, but by mutual agreement about 4,000 quit work. On the following day there was great disorder, and thruout last week the rioting was almost continu-

ous. The plant, which had been closed by the panic, was reopened five months ago, with a reduced scale of wages. The men have worked in groups, each group's foreman receiving the pay for all under his supervision and distributing it. There has been complaint that the pay was inadequate and that places in the groups could be obtained only by bribes. The strikers, few of whom speak English, were well armed, and they sought to prevent the employment of men in their places. Forty troopers of the State constabulary came to the aid of the company, and were assisted by 300 deputies and as many special officers. The story of what has taken place would be one of continuous war. For example, during the riots on the 14th more than 100 persons were injured, two fatally. There were similar riots on the following days, and the local hospital is filled with the wounded. The company's president refused to consider any proposition from the strikers and gave notice that not one of them would be employed again. On the 17th, the strike of 200 riveters at the works of the Standard Steel Company, in Lyndora, compelled 3,000 other workmen there to be idle, and on the following day 500 employees of the Standard Wheel Company quit work. There was a riot at Lyndora on the 18th, when a company of troopers was attacked by the strikers. Ten of these were arrested and one was mortally wounded in the fight. It became known on the same day that the strikers at McKee's Rocks had obtained large quantities of dynamite and were intending to use it. President Hoffstot asserted that he had 2,000 strike breakers at hand and was ready to set them at work if the authorities would protect them. At the beginning of the present week the military authorities of the State, under the direction of Governor Stuart, were selecting stations for field artillery and sites for militia camps in the vicinity of McKee's Rocks.

The Islands

The Japanese on strike in Hawaii have repeatedly disobeyed the injunction recently issued by Judge Robinson, to restrain them from intimidating men working in their places, and it is expected that several hundred of

them will be required to answer charges of contempt of court. On the 12th, there was the beginning of a new strike on a plantation eighteen miles from Honolulu, several hundred Japanese quitting work, because their employer had refused to discharge five Japanese who had excited the hostility of their associates. There was much disorder, and the sheriff arrested several of the strikers. He was at once attacked by an angry mob and forced to seek refuge in a sugar mill. Deputies from the city rescued him on the following day, and eighteen strikers were placed in jail. Their associates then returned to work.—Governor Post, who recently returned to Porto Rico, says he was told in Washington by the President that he could retain his office as long as he desired to do so.—In Cuba, nearly a year ago, Governor Magoon appointed James Page, an American, chief engineer of the water supply and sewer system of Cienfuegos. Mr. Page recently received notice of the Government's intention to dismiss him on July 20. The American Minister at Havana was instructed to protest against this removal. The Cuban Government has decided to retain Mr. Page.—President Gomez has directed the managers of the new Cuban national lottery to reserve for him at the first drawing the ticket numbered 1895, the year of the beginning of the war for independence.

Countries South of Us

Reports from the Government at Bogota say that the revolution in Colombia is ended, and that those who were in revolt at Barranquilla and other places near the mouth of the Magdalena River have surrendered. General Ortiz was their commander.—Owing to renewed attacks upon the Argentine legation at La Paz by angry Bolivians, the Argentine Minister and his wife fled to the palace of Bolivia's President for protection. The Minister then decided to leave the country, but recent reports say that he will remain at his post. Much property in La Paz belonging to resident subjects of Peru or Argentina was destroyed by mobs, and the Argentine consulate at Tupisa was wrecked. The Peruvian Government advanced money to pay for the homeward passage of Peruvians, and many of these

have left Bolivia. In Chili, war between Peru and Bolivia is expected, but in the Peruvian capital there have been no attacks upon Bolivians, President Leguia having successfully urged the people to preserve the peace. It is said that the Bolivian Government has decided that it will not accept the decision of the Argentine President concerning the disputed territory, also that it will await the action of Congress in August. President Montes has apologized to the Argentine Minister for the assaults of the mob, and has given him a guard of 800 soldiers. It was asserted in Buenos Aires on the 14th that he had sent an apology to the Argentine Government, which was satisfied with it, but on the following day this was denied at La Paz.—The arrest of several men at Fuerte, in the Mexican State of Sinaloa, has brought to light a new revolutionary conspiracy against the Diaz Government. It was intended that the uprising should take place on September 16, and it is said that the movement was to be directed from San Antonio, in Texas.—At the demand of our Government, Colonel Garcia, a provincial magistrate in Guatemala, has been removed from office, because (owing, it is alleged, to bribery) he failed to bring to justice the murderers of William Wright, an American citizen and a negro, who was killed by a mob.

✽

Aeronautic Progress

The Wright brothers have many rivals this summer and while they are experimenting without much success at Fort Myer, near Washington, other aviators have surpassed their feats. At Doue, France, June 18, M. Paulham reached an altitude of 450 feet, a higher point than any heavier-than-air machine had before attained, about 100 feet above the best record of Wilbur Wright last year. M. Paulham has made two flights of about an hour, stopping only when his gasoline gave out. He began his practice with the aeroplane less than a month ago. M. Bleriot, who is the first aeroplanist to make a cross-country flight, from Etamp to Orleans, about twenty-five miles, has also broken the speed record by flying 2000 meters in two minutes nineteen seconds. Special interest attaches to M. Bleriot's experiments because he uses a monoplane where

as most of the other practicable machines in use are biplanes. Mr. Hubert Latham has, however, constructed a monoplane of very simple and ingenious construction with which he tried to fly across the English Channel to win the London *Mail's* \$25,000 prize, but fell into the water when half way across because the motor stopped. In this country Mr. Glen H. Curtiss, experimenting at Hempstead Plains, near Mineola, L. I., has done better work than any American this year. On July 18, he made a flight of 29½ miles, remaining in the air 52½ minutes. Last year Orville Wright at Fort Myer made a flight lasting one hour, ten minutes and fifty seconds, while Wilbur Wright in France covered 100 miles in two hours, eighteen minutes and thirty-three seconds. This secures for Mr. Curtiss the *Scientific American* trophy which he won last year with the "June Bug." His present machine, the "Golden Flier," is only twenty-nine feet wide, while the "June Bug" was forty-six. In some respects it is an advantage in construction over the Wright machine, as it is much smaller and rises from the ground with a preliminary run on its three wheels, while the Wright aeroplane has to be launched with considerable velocity by means of a weight falling from a derrick. Mr. Curtiss will represent the Aero Club in the International Aviation Race at Rheims, France, on August 28. The "Golden Flier" when put in charge of a novice, Alexander Williams, was shipwrecked as soon as she started on the first flight. He rose to a height of about forty feet and by a sudden jerk of the rudder he turned the aeroplane so sharply to the right that it tipped over. In the fall the machine was injured and Mr. Williams had his arm broken. The new machine with which Orville Wright is experimenting has not worked well and still days having been rare, so there has been much disappointment to the Congressmen, Government officials and other Washington people who have assembled on the ground daily in the expectation of seeing the cross-country flight with a passenger which the Wrights are obliged to make before their aeroplane is purchased by the Government. The longest flight so far made by Orville Wright this season is seventeen minutes.

The Revolution in Persia

In spite of the protests of the Russian and British representatives, and their threat that foreign intervention was inevitable if the constitutionalists approached the capital, they continued to advance and have now captured Teheran and deposed the Shah. The Bakhtiari from the south, under Sardar Asad, effected a junction with the constitutionalists coming eastward from Resht, Kazvin and the Caucasus, under the Sipahdar, Governor of Gilan. The latter was formerly a horse dealer of Tabriz, who showed his ability in fighting by clearing of brigands the roads leading to that city. He was a leader in the movement to establish a republic, with Tabriz as its capital. As the combined forces of the constitutionalists approached Teheran, they were visited by the representatives of the British and Russian legations, to urge them to withdraw. The Sipahdar stated his terms,

which were that the two commanders be permitted to enter Teheran with a body guard of 150 men each, to remain until they were satisfied with the working of the constitutional *régime*; that all the Russian troops leave the country; that the reactionary ministry be dismissed and the new ministers be selected by the anjumans (political clubs) thruout Persia; that the governors of provinces be appointed with the approval of the local anjumans, and a few other stipulations. These were declared preposterous by the Russian and British emissaries. A few days later, as the revolutionary forces got near the city, they express a willingness to concede some of the terms demanded, but the Sipahdar replied that he would see them in Teheran. The Persian Cossacks under Russian officers had several skirmishes with the forces of the Sipahdar, but on July 13, while the Cossacks were gathered on the western side of the city to defend a threat-

THE BAKHTIARI TRIBESMEN WHO HAVE CAPTURED TEHERAN AND OVERTHROWN THE SHAH.

ened attack from that quarter, a strong force rode around to the north and entered the gates there, taking possession of the parliament house, the foreign quarter and most of the city except Gun square, in front of the barracks held by General Liakhoff and the main body of his Cossacks. The Shah had taken refuge in his palace of Sultanabad, outside the gates to the northwest, and the troops under him defended the palace by musketry and at the same time shelled the parliament house. This was also under fire of the Cossacks in Gun square, who were with difficulty holding their position against the continuous fusillade and occasional charges of the invaders. The Russian flag waved over the house of General Liakhoff, from which the Cossack sharpshooters were firing. After a day and night of fighting the Shah became frightened, and, under an escort of British Sepoys, was taken to the Russian Legation, over which British and Russian flags were flying. The priests and dignitaries meeting in the parliament declared by this act the Shah had forfeited his crown, and the Crown Prince, Ahmed Mirza, a boy of twelve years, was declared Shah in his stead, with the exiled Ul Mulk as regent. The Sipahdar was made Minister of War of the Provisional Government. General Liakhoff, having nothing left to fight for, offered his services to the new Government and they were accepted. His Cossacks surrendered their arms, which were then restored to them, and then, under the authority of the Minister of War instead of the Shah, but with the same commander, they undertook the policing of the city. Notwithstanding the apprehensions of the looting and killing of foreigners which have been exprest frequently in the dispatches via St. Petersburg, the conduct of the constitutionalist troops, undisciplined and irregular as they are, has been exemplary. Prisoners have been treated humanely and no foreigner has suffered in person or property. The Russian bank, containing \$50,000,000, was protected by the entering troops. The new Shah is not the oldest, but the second son of Mohammed Ali, the deposed Shah. He is, however, the eldest son by a princess of Kajar family, of the royal blood, and had been therefore

designated by the late Shah as his successor. His mother, it is said, wishes to take him with her into exile, and the boy was taken weeping to the Peacock Throne. The Russian army from the Caucasus is still at Kazvin, 86 miles northwest of Teheran. The instructions of its commander are worth quoting for future reference:

The further advance of a portion of the force depends upon the course of events. It can only ensue upon the demand of the Imperial legation in Teheran in the event of the dangerous situation aforesaid arising. The commander of the force will be provided with the most definite instructions, which will emphasize that the exclusive object of the force must be the protection of the Russian and foreign legations, institutions, and subjects, while abstaining from any interference in the political struggle raging in Persia and generally in the internal affairs of Persia. The Russian troops will remain in Persia only until the lives and property of the Russian and other foreign diplomatic representatives and subjects and the safety of foreign institutions seems to be completely insured."

Chaos in Morocco

Mulai Hafid seems to be no more successful in maintaining order in Morocco than his younger brother, Abdul Aziz, whom he deposed. As a matter of fact, the position of Sultan of Morocco is an impossible one, because no ruler can comply with the demands of the Powers and at the same time satisfy all factions of the people. There are four or five distinct revolutionary movements in the country, and the Sultan is without troops or money to defend his rights. One party is trying to restore Abdul Aziz to the throne. Bu Hamara, who has for several years been the leader of a revolutionary party, is again active. Mulai El Kebir, a brother of the Sultan, who claims the throne, has been proclaimed Sultan at Zemur and has captured Mekinez. Another pretender, known as the Roghi, is reported to have entered Fez, the capital, and to have surrounded the palace containing the Sultan Mulai Hafid. On the Riff coast General Marinus, the Spanish governor of Melilla, having received reinforcements of Spanish troops, is engaged in a lively conflict with the Kabyle tribesmen. Public opinion in Spain is divided on the question of intervention in Morocco. The Republicans and Radicals of Catalonia

are manifesting violent opposition to the Government by means of mass meetings and public demonstrations. On the other hand, a large number of young men of aristocratic family have volunteered for service under General Marinas.

Greece Considerable damage was caused in the province of Elis, Southern Greece, by earthquake shocks on July 15 and 17. In the first shock 26 persons are reported to have lost their lives and 100 more injured, chiefly in the village of Havari, where two or three hundred houses were demolished. In the later shocks several more persons were killed and a large number injured. Ten villages report destruction of buildings. Fissures were formed in the earth in some places from which hot water and, it is also said, molten lava are flowing. Earthquakes are reported on the same date from Lisbon, Portugal, and Santa Barbara.—The ministry headed by Mr. Theotopis has resigned because of its disapproval of the anti-Turkish agitation. The manifestations of this feeling were the mass meetings held to sympathize with the Greeks who suffer under Turkish rule, and, second, an organized demand of the officers of the army and navy for an increase in the means of national defense. Mr. Rhallis has been asked to form a ministry.—The four Powers who form the protectorate over Crete have decided to adhere to their plan of withdrawing the forces of the Powers on the date set a year ago, July 27, 1909, but four *stationnaires* will be sent, one of each Power, to guard the Ottoman flag and the flags of the four Powers. A declaration to be addressed to the people of Crete promising, in particular, that the Powers will continue to occupy themselves with the Cretan question in a benevolent spirit, but adding that it is their duty to see that order is maintained and the safety of the Mussulmans in Crete assured; that with this object they reserve the right of adopting such measures as may be expedient for the restoration of tranquillity, in case disturbances should break out which the local authorities were unable to quell. The Porte requested the Powers to be al-

lowed to send a guard ship to Crete, but the request has been refused.

Foreign Notes

Don Carlos of Bourbon, Duke of Madrid, died on July 18, at Varese, in Lombardy, at the age of sixty-one. He was the head of the oldest surviving branch of the house of Bourbon, and therefore had claims to the thrones of both France and Spain. He was debarred from France by the law of 1813 and establishment of the republic, and from Spain by the disregard of the Salic law, debarring woman from the succession. The claims of his father, Don Juan, were responsible for the Carlist risings of 1848, 1855 and 1860, and Don Carlos came near gaining the throne of Spain in the four years' war in 1876. His pretensions descend to his son, Don Jaime.—The Infante Alfonso of Bourbon-Orleans has been deprived of his title and stripped of his Spanish honors and decorations, on account of his marriage, on July 15, to the Princess Beatrice of Saxe-Coburg without the royal assent. He is a great-grandson of Louis Phillippe of France.—In order to put an end to the abuse of absenteeism in the French Chamber of Deputies, the Chamber has adopted a rule that all members shall sign an attendance book on arrival, and if they omit to do this for six consecutive sittings they shall be regarded as absent without leave, thereby losing the right to payment for those days. Voting by proxy has been very common, and sometimes as many as 500 votes have been recorded when not a tenth that number were present.—The court martial held at Adana finds that the Vali, the revolutionary commander, and other officers of Adana, are guilty of complicity in the massacres of the Armenians last April. It reports, however, that it would be difficult to punish all those concerned in the massacres, because their number is so great. The court martial reports that "800 deserve death, 15,000 deserve penal servitude for life, and 80,000 deserve minor punishments. If the Government decides to carry out the punishments we will establish a cordon around the town and deal with the matter expeditiously."

Does Prohibition Prohibit?

[The following letters from our readers fairly represent the great number sent us. Unfortunately the limitations of space prevent our using them all, and even most of the following have been abbreviated. It was to be expected that the prevailing number would call attention to the evils they have observed.—EDITOR.]

Eight Good Observations.

In New York State the town, which is a subdivision of the county, may vote every second year upon the questions of licensing hotels, saloons, retail liquor stores and pharmacists. The cities are excluded from this privilege. The average New York town has an area of thirty or forty square miles and a population varying from a few hundred to six or seven thousand. It will readily be seen that in an area so restricted, especially when surrounded by more or less of license territory, the possible effects of prohibition are reduced to a minimum. I have had the opportunity of comparing license with no-license conditions in several towns, and my conclusions are summarized somewhat as follows:

1. In accordance with the general rule, no-license is much easier to obtain and much more effective when obtained, in a purely rural town than in one containing a large village.

2. In the larger villages, no-license produces a marked result when it first goes into effect. Liquor selling for a time at least is quiet and secret. Hotels sometimes make a show of nailing rough boards across their doors and turning away guests. This farce usually lasts only a few days or weeks.

3. The saloons are the first to be deprived of license, and are seldom maintained in violation of law. The hotel barrooms then do most of the business. When they also are outlawed, the drug stores usually retain their licenses and profit greatly by their legal monopoly. Large quantities of intoxicants are also shipped in to private consumers and delivery wagon dealers.

4. The prohibition wave often spends itself in the no-license vote, leaving the law to enforce itself. In such cases, liquor is openly sold again after a few months.

5. The enforcement of the law depends upon the attitude of the authorities. When private citizens are obliged to push enforcement unaided, they often find insurmountable obstacles. Evidence is hard to obtain, and prosecuting officers generally indifferent or hostile. Grand juries moreover will refuse to indict and trial juries to convict on evidence twice as strong as would be required in a murder case. But when the authorities are in sympathy with the law, all this is changed, and the liquor laws become as effective as the law against larceny. Many counties have recently shown a marked improvement in conditions of enforcement.

6. With all its limitations, town prohibition, under any respectable degree of enforcement, is worth while. Regular drinkers will of course continue to obtain liquor, but they are likely to drink less in proportion to the diffi-

culty of procuring it. The elimination of saloons and the closing or even half-closing of hotel barrooms largely reduce lounging, casual drinking and treating. In the great majority of no-license towns, public drunkenness is far less common than under license. But the greatest advantage of all is the restriction of opportunity for young men and boys to form the drinking habit. It is in the licensed and "respectable" barrooms the careers of nearly all drunkards are begun.

7. The charge that no-license is a damage to general business in New York towns and villages is the veriest nonsense. In manufacturing towns, where labor is in demand, workmen will sometimes refuse to settle on account of no-license. But this difficulty is more than made up for by the increased effectiveness of sober men. A few farmers will draw their produce by preference to a license town; but the saloons get nearly all the money they spend.

8. When a town lapses from license to no-license, it is usually because of the discouragement of the temperance people over imperfect enforcement of the law, the apathy of the general public toward moral questions, and the prompt and business-like activity of the liquor men. They are fighting for their living; the reformers, apparently, for their health.

HOWARD L. RIXON.

SKANEATELES, N. Y.

Good for Starkey!

Our township of Starkey has now had over four years of no-license. The result has been in every way satisfactory in the reduction of drunkenness, quietness upon the streets of our villages and in the more orderly appearance of our streets. The "bum" element has disappeared from their accustomed haunts and either gone to work or migrated to more congenial climes.

The most noticeable change is at our annual town fairs, where formerly many people were more or less under the influence of liquor and especially at night a riotous, half-drunken crowd made our streets no fit place for a woman to walk. Since the advent of prohibition all this has changed. Scarcely a drunken man is to be seen and our streets are safe places for the passage of women even in the evening.

Several parties in town thought that they could sell liquor on the sly without detection, which they did for a time, but through the efforts of the Law and Order League in their vigorous prosecutions these men soon found to their sorrow that they could not. Some pleaded guilty, others have indictments hanging

over them and all appear to have quit the business.

The fact of law enforcement in the town of Starkey has had a marked effect in carrying the county dry.

During the campaign the merchants in Dundee, which is in the town of Starkey, were interviewed and the majority gave good testimony to the benefit to their business resulting from no-license. The two banks said that their deposits had increased, some claimed better collections and nearly all that there had been no falling off in their business. These testimonials were published, which strengthened the weak knees of the merchants in other towns who were expecting disaster to their business in case of no-license. The reverse has certainly been true of the town of Starkey. Our town is more prosperous than at any time in its history, less liquor is drank, the liquor laws are better enforced than ever, and as well as most laws upon our statute books.

JAMES S. FROST.

LAKE MONT, N. Y.

Birmingham's Experience.

Birmingham is a large and cosmopolitan place, with a varied population, many of its residents being foreigners with a holy horror of prohibition. In the election the county is the unit. The city itself gave a small majority against prohibition, the suburbs and the country districts furnishing the dry majorities. Thus it happens that the law faces in Birmingham proper the most adverse conditions. Add to this general condition the further fact that the opposition has control of the City Council and the prosecuting department of the Criminal Courts. Pile on this the attitude of judges who have construed the law with exceeding strictness, giving the defendant the benefit of every doubt. Yet we have made progress. A large number of the best citizens are active members of the Law and Order League, and the pressure on the violators of the law is constant. The decrease in the consumption of liquor and in the crimes that grow out of it, is substantial. Less liquor is brought into Birmingham by the express companies on all the roads than formerly went out on a single line. Liquor is still consumed, but has been driven to cover. Public sentiment is growing in favor of prohibition and is already strong enough to prevent open violations. To make a lasting success we realize that the law must be strengthened in those points where the courts have destroyed it by construction, and that we must elect new men to the bench and the solicitor's office. This will take time, but in the meanwhile the work of educating the rising generation goes on. In every Protestant Sunday school and church prohibition is taught and preached. We are aware that enforcement depends on public opinion, and with every boy who enters Sunday school the tide of public opinion rises higher.

FRED M. JACKSON,

Pres. Jefferson Co. Bldg. & Loan Ass'n.
BIRMINGHAM, ALA.

The Tale of Uncle 'Lias.

Last year, having occasion to spend some time in a small village in the South, I was much interested to note the effect of prohibition. The closing of the saloons was accomplished while I was there, the town having gone "dry" at the last election.

Not far from where I was staying lived an old dorky, Uncle 'Lias, and his wife, Sophronia. The wife supported the two by washing, altho Uncle 'Lias worked well all the week; but on Saturday night went home with empty pockets and in a beastly state of intoxication.

The Saturday evening following the closing of the saloons we saw Uncle 'Lias wending his way up the street with his arms full of bundles, and one particularly long one, carried very gingerly.

One of the gentlemen present called out to him: "Uncle 'Lias, what all have you got there?"

Uncle 'Lias grinned and chuckled and shuffled around on the sidewalk, and finally came out with: "Say, boss, you know I couldn't git nawthin' to drink tonight, so I jus' nachelly had to buy something down to the grocery and then I thot I'd git a little present for S'phrony," displaying with great pride a new parasol.

I felt there was a whole sermon in that sentence, and could imagine "S'phrony" after seeing the display of necessities and the "present" exclaiming: "Bless the Lord!"

M. ALICE CROOKSTON.

PALMYRA, N. Y.

Local Option a Failure.

I am in no way, directly or indirectly, connected with the liquor business and never have been.

I have, however, given the question of so-called local option in Illinois, my native State, careful consideration and study, and, from such study and investigation, I pronounce the act and its workings not only vicious, as it fails to carry out its object—the restriction of the consumption of liquor—but actually causing drunkenness and the destruction of private property interests, as well as injuring and hindering the municipal governments.

I voice these statements upon actual investigation of conditions in the following towns of Southern Illinois, many of which being county seats: Vandalia, Effingham, Carmi, Mt. Vernon, Johnson City, Marion, Herrin, Carbondale, Percy, Coulterville, Pinckneyville, DuQuoin, Virden, Girard, Sandoval.

The so-called local option act—a misnomer and a fraud, because in its application, restricting the issuance of licenses in cities and towns, the voters of suburban or outside sections, who have no interest in the government of the cities, by their votes control such cities—was enacted and became a law in those cities in April, 1908.

Before the end of the first half-year period of the fiscal year of such towns, usually October 1, the city treasuries of over 90 per cent. of the towns were absolutely penniless, on account of the failure of local option territory, under existing revenue laws, to produce sufficient revenue for the usual city purposes.

All of those towns curtailed expenses, and many of them discharged the police, stopped all work on the streets, while some cut out the electric lights. Many also resorted to the issuance of anticipation warrants, an abominable method of tiding over present financial difficulties.

When it is known that not more than two per cent. of the valuation of property can be levied and collected for city purposes, how can there be any change in financial conditions of such towns, for the better, during the period of local option?

The advent of the "short" revenue period for the cities had an immediate detrimental effect upon the real estate of such places. Rents fell, and the actual selling prices of lots and houses dropped and remained many per cent. lower; so that the actual city revenue is now raised on a lower intrinsic valuation basis for such property. Another burden for the owner and taxpayer.

The records of the courts and the records of the station agents show that there is more liquor sold in the local option territory of Illinois than ever before. The joint and speak-easy are found on every corner, and many of the people who have the necessary money send off and buy liquors in quantities, which produce drunkenness and disorder. In Union, Johnson and other counties, the circuit and county judges have called a halt in the raid on the county treasuries by the professional snitches, parties who make a business of spying upon the blind tigers and the bootleggers, as the work is driving the counties also to the wall.

My personal observations are, therefore, that prohibition, under the guise of local option, is productive of evil instead of good. It fails to produce sufficient revenue for the cities and towns, which condition causes bankruptcy for them. It fails to prohibit everywhere, as the records of the county courts fully testify; and finally, it produces a backward trend in real estate values, and has a deterrent effect upon investors for commercial or other purposes.

STEPHEN P. MONAHAN.

EAST ST. LOUIS, ILL.

Abstemious Des Moines.

The Grant Club, of Des Moines, Iowa, is a non-partisan political club, the only financially successful clubhouse for men where meals are served and reading rooms and bowling alleys are open to members and friends. No liquor is permitted to be served on the premises.

Ingersoll Park is an amusement park, with outdoor vaudeville performances, roller coasters, etc. It is highly successful financially and a place which all the people patronize. No liquors of any kind are ever permitted in the place. As a result, the grounds are decent for children of all ages and it is a summer outing place of respectability and good cheer.

The Des Moines Golf and Country Club is another example. When the fine grounds were leased for the new eighteen hole golf course an influential citizen who believed sincerely in

prohibition was successful in having the clause put into the lease that no liquor of any kind should be sold on the place or the lease would be forfeited. The result is one of the most beautiful and successful clubs in the United States, where children and young people may go and come with parents or without, and where most of the members would be loath to have it different.

We believe these conditions have been brought about by the sincerity and courage of those citizens who stood for a good cause in its dark day and have lived to prove to those fearful lest it would hurt business to do away with liquor that the latter were mistaken.

VIRGINIA J. BERRYHILL.

DES MOINES, I.

Express Packages in Michigan.

If prohibition really did prohibit, I believe ninety per cent. of the American people would declare in its favor. About the only salutary effect is the elimination of the saloon. While our drug stores have complied strictly with the law, it has nevertheless seemed to be necessary for the owners thereof to sell some liquor. Two of the drug firms in this city are outspoken against local option, and I understand the remaining two are also opposed to it. Quantities of liquor are sent into the county from the outside to the individual consumers. The druggists sell but a small percentage of the total amount consumed in this county. Out of twenty-four packages of express recently coming into one of our express offices, eight consisted of consignments of liquor of some quality.

Repeated violations of the local option law are occurring. At the first day of the present June term of court, eleven violators were on the carpet. Nine pleaded guilty, one was put over the term and the other was tried, resulting in a verdict of guilty. The latter case has been appealed to the Supreme Court. Only two of the number pleading guilty paid a fine. A large expense is, therefore, settled upon the county.

J. EARLE BROWN.

ST. JOHNS, MICH.

Five of Whom Are Girls.

As a temperance man from childhood, for many years a prohibition and Good Templar worker, formerly publisher of the New England *Good Templar*, twenty-five years devoted to reform movements; an earnest, and, I believe, conscientious member of Christ's Church, the father of six children, five of whom are girls, knowing the imputations that invariably follow a statement of this kind from a man in my position, I hesitate to record my present belief as regards the question "Does Prohibition Prohibit?"

For many years I insisted that prohibition and sumptuary laws alone could regulate the question of intemperance. Ten years' residence in Wisconsin has completely changed these opinions.

Milwaukee is undoubtedly the "wettest" town on the map. In directing a stranger to any given locality it is quite common to say "Go seven saloons north and three west." Theoretically, such conditions should make this city the most drunken and disorderly in the country. Honesty compels me to admit, however, that Milwaukee is the most orderly city with which I have ever come into contact. Beer and light wines are consumed freely and the result is that very little of the stronger drinks is used. In ten years I have not seen a dozen men the worse for liquor. No city in the country can show as many *homes* owned by the working classes. We have no labor troubles. You can go to our public parks any Sunday afternoon and see from fifteen to twenty thousand people enjoying the band concerts, and drunkenness is an unknown quantity. I do not hesitate to allow my daughters to visit their friends in either daytime or evening, as life is just as safe on our streets as in the confines of the home. The moral status of Milwaukee is second to no city of its size in the country, and on this point I defy refutation.

I have no defense to make for beer or light wines, but any one who will make an *honest* investigation of conditions here will be forced to admit that we have about the most healthy, contented and respectable class of people in the country.

I made a careful study of conditions in my native State of Maine a few years ago and was amazed at the difference. I saw more drunken men in the month I was in Maine, *many times more*, than I have seen in this city in ten years' residence. I found that every man who had a desire for intoxicants was *well supplied* and more whisky was offered me in my month's visit than has been offered to me here in ten years.

I have come to regret that so many of my fellow churchmen insist on treating the question from the theoretical point of view, basing their belief upon the presentation of professional political agitators instead of making an honest investigation of the facts.

The evils of intemperance are so pronounced that any movement that tends to make whisky drinkers out of a class of people who would otherwise make temperate use of beer and mild wines should be given careful consideration. Prohibition will never *prohibit*. Regulation *will* regulate if divorced from party politics. Let us have regulation.

EDWIN B. LORD.

MILWAUKEE, WIS.

Hypocritical Wahoo.

In the town of Wahoo, Neb., are eleven churches and four saloons. Apparently there should be a large majority in favor of a dry town, but at the last town election the candidates for councilmen who favored prohibition were defeated by the votes cast two to one, and why?

The four saloons pay annually into the public school treasury five thousand two hundred dollars, and those who from the housetops cry

prohibition, when secretly they cast their vote, take into consideration the increase of taxes if the saloon money is cut out. We do not say anything about the back entrance or political aspirations.

C. J. CARLSON.

WAHOO, NEB.

The Social Glass in Texas.

Saloon men in neighboring towns secured the names of all habitual drinkers and all others who might be induced to take a drink. The first class they furnished by express as regular customers, and to the others they would ship C. O. D. a jug of whisky, then notify them by mail to call at the express office and receive a package. Many, who would not have thought of ordering it, would do as requested, as it was there for them. Some would pay no attention until happening to be in town they would be notified in person by the express agent, when, if in company with others who wanted a social glass, would take and pay for the liquor. In this way the evils of the treating habit were present; and I am satisfied, tho I can't explain it, that this system was more harmful than the open saloon, especially among young men and boys. If a consignee actually refused such a shipment, the shipper had only to notify some one else that a package for so-and-so was at the express office, and if he would call and pay the charges it would be delivered to him. By this means the shipper was always sure of a sale, and it is not on record that a shipment was ever returned.

C. W. MARTIN.

SAN ANTONIO, TEX.

Eloquence from Tennessee.

Today, July 1, Tennessee will try State-wide prohibition. The last Legislature so enacted, but the question was never submitted to a popular vote. Had it been it would have been defeated by an overwhelming majority. This was evidenced by the very large majority for Governor Patterson over the brilliant Senator Carmack, the latter being for such a law and the Governor opposed to it. It will not do away with the sale nor drinking of liquor any more than local option has done, and there will be as much money spent, but the money will not redound to the benefit of Tennessee. Contrariwise it will necessitate an increase of taxation on the necessities of life. It will drive away manufacturers of beer from cities like Memphis, Nashville, Chattanooga, Knoxville and other places. It will be a heavy loss of revenue, 't we'll have beer, whisky also.

I will cite, briefly, an instance in Nashville, being nearest me of the cities mentioned, and, "*ex uno disce omnes.*" There is Mr. William Gerst, a gentleman who was induced to go to Nashville and invest lavishly in the manufacture of beer, yet the State—no!—the *Legislature*, in a moment of frenzy, has virtually confiscated his property and will lose a most worthy and public spirited

citizen—one whose purse was ever open to public enterprise. Why, sir, the Gerst Brewing Company donated \$2,000 to our Centennial. Employees of the same company donated \$600. Mr. Gerst gave \$10,000 to the Centennial Company for restaurant concessions and erected four buildings at a cost of \$15,762.62. He paid \$12,000 for equipment, fed inmates of charitable institutions for nothing, and made no charge for members, their wives and children, of the Press Associations from many States—Virginia, Louisiana, Illinois, Nebraska, Ohio, North Dakota, Wisconsin, Minnesota, and other States. His object was to advertise Nashville and the beautiful Southland.

I mention this one instance to show how ungrateful, if not malicious, fanaticism can be, and *is*, to vent its spleen. It makes me think of the days of witchcraft in the Colonies from about 1645 for forty or fifty years, away up in Massachusetts. That awful frenzy passed away almost as suddenly as it had arisen, leaving to future ages a fearful warning against such popular insanity. So it will be as to this effort to fetter a freeman's will. Madame Roland exclaimed on the block when awaiting the axe of the executioner: "Oh, liberty! in thy name how many crimes are committed!" The patriot, Patrick Henry, said: "Give me *liberty* or give me death!" And the women sing and pray, and call on Jehovah. But I will say to them that whatever ceremonies among men have rendered them most ridiculous and absurd; whatever crimes most infamous in the eyes of their own species and impious in the sight of Heaven, are to be traced to the iniquity or perversion of their religious institutions. As for myself, I grant to no one, from the throne to the cottage; from the philosopher to the clown; from the most exquisitely refined to the rudest barbarian, to prescribe what I *shall* or *shall not* eat or drink.

(COURT) WM. J. SEATLER

WINCHESTER, TENN.

Not a Success in Texas.

As to how prohibition works perhaps a few statistics will give the best and quickest answer. For a period of ten and one-half months prior to the change there were filed in the various district and county courts seventy-seven cases of persons charged with various misdemeanors, presumably due to saloon influence. For the ten and one-half months *after* the law was supposedly effective, the same records show 179 cases filed, or an increase of 102 cases, all for violations of the liquor law.

Other crimes, including murder, manslaughter and similar capital crimes have more than doubled in the same time.

There were in the city of Amarillo, prior to this election, thirteen saloons, two wholesale whisky dealers, two wholesale malt dealers and two other persons who had licenses to sell on their premises. Under prohibition twenty-seven persons have secured Internal Revenue

licenses to sell liquor in the same city, giving as a general rule the same places of business occupied by the saloons, or nearly twice as many persons engaged in the business as before. The loss to state, county and city has been over ten thousand dollars in refunded and discontinued licenses, besides the taxpayers are carrying the burden of increased court costs.

As to the blessings promised by the pros, they have not materialized, drunkenness is as disgustingly common as ever, the local sanitariums have the same old gang of delirium tremens patients.

For a time the local officers acted under what is known as the "search and seizure act," and many places were raided, quantities of whisky was found, in most unexpected places, such as private residences, coal bins, etc.

My business as a newspaper woman brings me directly in contact with printers daily and I can truly say, for them the change has been deplorable. Formerly they would slip out the back way, get a glass of beer and come back and go to work; now they get a bottle of whisky and drink until they are of no use to anybody.

One thing is undoubtedly true. Prohibition has driven out beer and mild alcoholic drinks, because they are too bulky to hide and cannot be sold as readily as whisky, but to my mind it has fostered the most serious form of intemperance.

MIRIE MORRIS MORGAN

AMARILLO, TEX.

Prohibition Prohibits in Oklahoma.

A year and a half ago we carried State-wide prohibition for twenty-five years by a large majority, and the law is very well enforced. There are some violations by bootleggers, but these men are very soon apprehended and land in jail, as our law requires a jail sentence in addition to a fine. There is practically no drunkenness since our law was enacted. The change was immediate and almost complete. So great has been the improvement over the former license system that business men who voted against prohibition, under the impression that it would hurt business, have acknowledged that they were mistaken, and that the result has been wholly good. They sell more goods and it is much easier to collect their bills. They are now in favor of prohibition.

The whisky crowd went up and down our State telling the people what dire results would follow prohibition. Business would suffer, trade would be driven away, cities would be full of empty buildings, grass would grow in the streets, there would be no money for running the city, or for paving the streets or building sidewalks, and many other things, not one of which has come to pass. The exact opposite in every case has resulted. There are no empty buildings, there is plenty of money for running expenses; city paving and sidewalk building were never before seen on such an extensive scale as right now. Good school houses are being built, and more children attend school and the children are better

clothed. And one of the most remarkable things about this whole business is that when we closed our saloons nearly every other kind of crime stopped. Prohibition has been such a blessing in Oklahoma that we are simply amazed that all the other States have not adopted it.

(REV.) J. A. B. OGLEVEE.

PAWHUSKA, OKLA.

Bringing the Jag Home.

Over thirty years' experience in Indiana, Michigan and Wisconsin has shown me that (1) No-license helps the rare community which is dominantly abstinent and practically isolated. (2) In most cases it means a clandestine traffic and a patronage of license towns, men thus leaving their money in the license town and bringing the jag home. Stoughton and Edgerton, Wis., are in point. There always will be the "next" town or State or county and the weakness and craft of human nature to evade law.

After ten years' residence here I believe in the "Milwaukee policy." We have proportionately far less of the evils of the traffic than any other large city in America, less by any ratio. For this there are three reasons: 1. The fact that a man can get a drink whenever he wants it prevents the pocket flask and the morbid craving for the forbidden. 2. You cannot expect, among 350,000 people, to escape all vice. But these we persistently war against. In this the brewers and the public authorities work together. If we could banish the senseless custom of "treating," which mistaken American sociability has foisted on our independent German people, we should have little trouble. 3. Our popular beverage is beer, which does not make drunks unless mixed with strong liquors. This is where "treating" does its mischief, for it leads to high wines and whiskies, bad enough alone, and on top of beer enough to upset anybody.

Work to make the traffic as public as any other business; to eliminate unworthy dealers; and to give the preference to mild beverages. That is our policy.

(REV.) THOMAS EDWARD BARR.

MILWAUKEE, WIS.

The Joys of Bacchus in Oklahoma.

In the smaller towns of Oklahoma the liquor situation is easy to control, provided the constable, deputy sheriff and justice of the peace will do their duty. The pint bottle of whisky is the "bootlegger's" stock in trade. The stock of goods is shipped to him at his own risk by the distiller from another State. If he can get his goods out of the depot and conceal them he will find no trouble in finding thirsty patrons to buy his forty-rod at a dollar a bottle. This business is carried on by men in various occupations and by those in no particular occupation. There is no public drinking; when men want a drink they retire to a water-closet or some other such quiet retreat, and enjoy their libations. A resi-

dence of from thirty to ninety days in the county jail gives the bootlegger a chance to reflect and does more to discourage this form of lawlessness than anything else that has been thus far devised. I have seen villages where the thirsty have returned to lemon extract and red ink for a long period after the bootleggers had been sent to jail.

JOHN W. CARR.

LINDSAY, OKLA.

The Speak-Easy.

Anent the testimony from prohibitory districts relative to the "speak-easy" evil, the situation in this county (Allegheny) with its Scotch-Irish stock of Americans, its strict Sabbath laws, and its high-license law so uniformly praised by anti-prohibitionists, is interesting. Not long ago the Retail Liquor Dealers' Association here investigated the local situation in the interest of the licensed saloons, and discovered there were some 2,500 speak-easies in this county, being a greater number by almost a half than that of licensed saloons! A friend of the writer who is on intimate terms with a leading local saloon keeper lately said to him: "Why don't you have that dirty speak-easy almost back of your saloon closed?" The reply was: "For three reasons. In the first place he takes care of a class of trade I don't want; then again I sell him his booze; and third, I do not dare to have him arrested. If I did, he would be my enemy and go after me in License Court and I would lose my license; he could, of course, make a case against me for breaking the law; every saloon keeper breaks it." With this county, it is not a question of saloon or speak-easy; it is speak-easy or both. Z.

PITTSBURGH, PA.

The Most Whisky-Ridden State in the Union.

North Dakota, like Maine, is a standing prohibition object lesson. Its saloonless towns and the "absence" of liquid refreshments have furnished material for columns of anti-saloon argument, but I do not hesitate to declare and can furnish evidence to the effect that it is the most whisky-ridden State in the Union. Express and freight dump into its limits annually thousands of gallons of the vilest brands of "squirrel" whisky, and where its sale is not openly countenanced, violations of the prohibitive laws are at least overlooked. The backyard of the average country hotel, with its array of discarded bottles, is a standing advertisement of this fact, while broken glassware along the roadside is a daily reminder of the absurdity of the whole thing. This sweeping declaration may perhaps not be applied to the whole State, for there are sections where public opinion prevails and the statute is interpreted and observed literally, but it is safe to say that where two towns are liquorless, eight find a way to quench the thirst of those desiring it.

H. J. BYRON

ST. PAUL, MINN.

North Dakota Not Yet Ideal.

Your question, "Does Prohibition Prohibit?" asked some time ago, is of peculiar significance in North Dakota, which began her statehood with prohibition a part of her organic law. In a large number of the villages of the State the law is openly violated, and beer, wine and whisky are sold over the bar with no attempt at concealment. Where there is too much show of opposition to make such a course safe, such articles are shipped into the State on individual orders. A large part of such trade has been done under cover of fictitious consignees, the banks receiving and selling the bills of lading for casks or cases of beer, really occupying an unenviable position in this respect. The new Federal law may change that phase of the business. However, drug stores have always had licenses for the sale of intoxicating liquors and will under the new law, approved March 16, 1909, "for medical, scientific, sacramental or mechanical purposes." And the drug stores of North Dakota take the place of the saloons of other States. Drunkenness is as usual as tho the attempted restriction did not exist. The only noticeable difference between North Dakota and other States in respect to the traffic is that the "goods" cost more here, on the theory, doubtless, that violations of the law should command a premium.

HERRON, N. DAK.

G. R. BRAINARD.

Prohibition's Effect in Mississippi.

In Mississippi it seems that prohibition has had most influence on the white man reared to think no more of drinking intoxicants than water, and on the great mass of negroes. The gentlemen of the community, whether holding a bank directors' meeting or celebrating the birth of an heir to one of the old families, must do so by ordering drinks, first one, then another, until the result was disastrous. The pitiable feature was that some woman had to pay for the hilarity with tears, and some child's heart was made sad. It wasn't the least intended, but always happened. Under prohibition this has stopped, and with it much sorrow. Prohibition hasn't stopped drinking, but it has stopped drunkenness to a great extent. It's not so easy and tempting to order from outside the town or State as to send across the street to the bar.

In the case of the negroes, prohibition has been a Godsend to them, as well as to their neighbors and friends, the whites. It is of both economic and moral good. Since whisky has been impossible, or made more difficult in ordering, the Saturday purchasing list has many more useful articles on it, as increased sales in every store show.

Up to the time prohibition swept the State it was not rare for people to leave their homes Saturday afternoons. The negroes had shot time off, and men and women made for the saloons. Negroes who, when sober, were the incarnation of sobriety, seemed to lose their senses entirely when drunk, and be-

came as madmen. Shooting was the order of the day, and high revelry. As an example of the doings in one community, one evening a negro in his drunken recklessness fired a shot from his house, which instantly killed a young University of Louisiana student on the train at the depot, returning for the Christmas vacation. Another drunken negro, the same night, fell from his mule and broke his neck. Things of this nature happened often, and in nearly every case whisky was the cause. Prohibition has made human life safer and is a blessing that will increase as the great wave slowly tho surely will sweep the entire country.

M. M. McG.

WOODVILLE, MISS.

A Conjugal Debate.

A young married couple moved from one of the Southern States to a little town in western Kansas.

When they had been there only a short time the husband took a bad cold. He said to his wife: "I believe I will get some whisky and quinine for my cold."

"This is a prohibition State; perhaps you cannot get it," said his wife.

"Oh, never fear," said he; "prohibition does not prohibit."

He went to a drug store and asked for whisky.

"We dare not let you have it for love or money," answered the drug clerk.

"Is there any place in town where I can get it?" he asked.

"I do not think you can get it in this town," was the answer.

He then tried other drug stores, also the pool hall, with no better success. He returned home and said: "Wife, I was mistaken; prohibition does prohibit."

EFFIE BROOKS.

PASADENA, CAL.

Michigan's Experience.

To a large extent prohibition prohibits when the people want it to and elect officials that take an interest in the enforcement of the law. Such has been the experience of Oakland County, Mich., which went dry by a small majority in April, 1908, closing twenty-two saloons and one brewery in Pontiac, a city of about 12,000 population.

Before the local option election was held, the superintendent of the leading Sunday school of the city, seeking nomination for the office of supervisor, was defeated in caucus by an eleventh hour rush from a nearby saloon made in favor of a man not previously announced. The interloper was badly defeated, altho his associates on the ticket were elected. This, coupled with convictions of saloonists for violations of existing laws and the rotten egging of the store front of one of the active supporters of local option, is believed to have materially helped the dries to win the election.

After election the Sunday school superin-

tendent above mentioned was nominated for sheriff and elected by a top notch majority. The prosecuting attorney was at the same time re-elected by an increased majority on his record for good work. These officials, after considerable difficulty, secured evidence on which successful prosecutions of keepers of "blind pigs" were conducted; heavy fines and imprisonment sentences have been given in about a dozen cases, and it is now recognized by all concerned that illegal selling in this county under present conditions is far from safe. It is expected that the "search and seizure" law recently passed will further facilitate law enforcement, as it makes it much easier to secure acceptable evidence.

Merchants state that their business is better than formerly. Banks report increasing deposits. Aside from an occasional vagrant or liquor law violator our jail is generally empty. Drunken men are seldom seen on the streets, the few exceptions generally being those that have visited the neighboring wet city of Detroit. There has been considerable complaint of these individuals raising disturbances on the trolley cars, but this is now being regulated.

The loss of revenue from saloon licenses, about \$11,000 per year, has been noticed, but little is being said on the subject. As yet no advance in tax rate has been made on this account and municipal improvements are be-made as needed. Most of the business places vacated by the saloons have been taken up for other lines of business.

R. H. PARDEE.

PONTIAC, MASS.

Nebraska versus Kansas.

Nebraska has always been a license State and has one of the best license laws in the United States. You may write to any land agent in southern Nebraska and he will tell you that land values have always been higher there than in northern Kansas, a prohibition State. In Nebraska last year there were fifty-four failures with liabilities of \$350,668, while prohibition Kansas had 316 failures with liabilities of \$1,699,684. Nebraska produces more wealth every year than Kansas, whose population is 25 per cent. greater. Both States are naturally very productive. The only way these facts can be explained is that the most productive workers will not live in a prohibition State.

The little town of Lanham is bisected by the Kansas-Nebraska boundary line. On the Kansas side there are five saloons openly selling liquor, while on the Nebraska side there are none. Thus the school fund is cheated out of the tax the liquor traffic should be compelled to pay. Kansas adopted prohibition in 1880. I have evidence that the law officers cannot enforce it in the larger towns, while in the rural districts it is not nearly so effective relatively as is the Nebraska license law. Spasmodically the law officers try to enforce prohibition, but the rule has been to ignore it. Last year the captain of police at Leavenworth made an official statement of the

number of arrests for drunkenness, comparing the season of open saloons prior to the recent crusade with the season of closed saloons, which began in April, 1907. The open period cited by him was from October, 1906, to March, 1907, during which his men made ninety-three arrests for drunkenness. Now, remember, this covers a time when saloons were running openly in Leavenworth despite the statutory law. In comparison he cites the closed period from April to September, 1907, during which time his men made 137 arrests for drunkenness. Here are forty-four arrests for drunkenness when saloons were closed in excess of the number during the open season.

The captain of police of Leavenworth is only one of a number of police chiefs who make official reports of the closed season as compared with the open season. These official reports are record proof, incontrovertible, that saloons openly do business in many of the Kansas towns. In view of this record how can any honest man contend that prohibition prohibits in Kansas?

W. R. BENNETT.

OMAHA, NEB.

Ostentatious Prayers and Demonstrative Women.

One fault of temperance workers is their extreme sensitiveness to criticism by their friends. I am convinced that county victories would be increased if two errors on election days were remedied. The one is ostentatious prayer, and the other is demonstrative women on the streets and at the polls. There is a large class of indifferent voters who might be claimed for the dry, who are disgusted by this overreaching zeal. Americans will, owing to a spirit of chivalry, smile condescendingly, and perhaps, if the masculine in them is not too assertive, will even be persuaded to change their votes for the better. But the foreigners are almost certain to be driven to the opposite extreme. I write as one that believes in prayer, loves women, and only one generation removed from foreign soil.

J. E. H.

DELTA, OHIO.

He Trailed Roosevelt—At a Discreet Distance.

I was a newspaper reporter in New York City when Dr. Parkhurst made his first crusade against Sunday selling. No man who really wanted to get a drink—and his kind seemed more numerous than ever—had to go without it. A hundred different plans were used to violate the law. I followed Theodore Roosevelt, then police commissioner, at a discreet distance, when he made a tour of investigation to discover whether the Sunday law was enforced or not. He stated on his return that he found the conditions most satisfactory, when, as a matter of fact, I entered a saloon doing business within view of the police station, in almost every police precinct he visited.

My observation leads me to believe that the worst evil of drink is bad liquor; that all strong liquors are in themselves more or less harmful if used regularly; that whisky, brandy, etc., should not be sold under the same licenses as light wines and beer; that prohibition is in the broad view a worse evil than the thing it seeks to prohibit, and that a "prohibition wave," like a religious revival, is based on emotionalism and brings a reaction that more than offsets the good it may have accomplished.

E. W. GRAY.

NEWARK, N. J.

Perhaps Not.

Perhaps I "speak as a fool," but if prohibition does not diminish the liquor dealer's gains why does he oppose it? And if it increases his gains why is he not its enthusiastic advocate?

SARAH JEANNETTE BURKE.

NEW YORK CITY.

"Where Ignorance Is Bliss."

For fourteen years I lived in a town with fifty saloons, and there never was a day during that time, unless perhaps at long intervals, when the authorities became active on Sunday closing, when I could not have directed a man, wanting a drink, to fifty bars, where he could buy almost anything he wanted to drink any time a day and almost any time in the night. I have lived near three years and a half in a prohibition State and in a closed town, and while I am told that much of the time intoxicants may be had by the initiated, I could give only the faultiest kind of direction to a man hunting the place where he could find his desire. If prohibition possessed no other limitation in the drink traffic than this it surely would more than justify its passage in any State.

(REV.) JOHN H. J. RICE

EMPORIA, KAN.

Prohibition in Kansas.

For something like thirty years prohibition has been upon the statute books of Kansas City, Kan., and yet the State has probably produced the youngest drunkard in the world, a lad of five years, taken in charge by the Wyandotte Juvenile Association of Kansas City, Kan.

The Mercantile Club of Kansas City, Kan., recently made a trip thruout the State. The papers boasted of the fact that "there was nothing but water on board," and yet a colored man, famed as a mixer of "high balls," accompanied the party in his "official capacity." One of the members of the club, questioned about the presence of a drink mixer on a "prohibition special," laughingly replied: "That's where we need him."

Today the "reform wave" is at the height of its power in Kansas, and while prohibition may not soon be the screaming fad it was in previous years, it is still an open secret that

liquor can be obtained in every city, town and hamlet in the State; if not in openly conducted saloons, then in the lockers of the fashionable clubs, in the drug stores, the "speak easies" and in the numerous out of the way places pointed out to the thirsty pilgrim by the well informed resident.

The press reports and the records of the various police courts of Kansas show conclusively that prohibition does not prohibit in the larger towns of the State. The Associated Press dispatches of July 8 show that fifty-six women were arrested in Mineral, a coal mining center near Pittsburgh, Kan., on charges of disturbing the peace by wrecking four saloons for refusal to sell beer in buckets.

I. T. MARTIN.

DETROIT, MICH.

Bottles.

For several years this city, being the county seat of Owen County, in the State of Indiana, has not had a saloon. A merchant in this city recently advertised for empty bottles for the purpose of filling them with vinegar. Within ten days he received three thousand empty beer bottles, which had been picked up and collected in the streets, alleys and yards. Think of that! Three thousand bottles in a small country town like this.

M. M. EICKHOFF.

SPENCER, IND.

Between Wind and Water.

First—While prohibition does not absolutely prohibit, it does beyond a question restrict the sale and reduce the attending vices.

Proof—Carthage, Ill., a town of 3,500, has for years enforced this law and in fifty visits to that city a drunken man will not be seen.

Kansas City, Kan., enforcing the law strictly, has increased the pupils between twelve and eighteen years in her schools by 600, put herself in the lead of every city in the United States in building operations, increased her bank deposits wonderfully, decreased her court expenses and left the gates of her jail open to the world.

Where high license has been adopted there seems to have been less crime committed in making unlawful sales, false swearing and all that usually follows where laws against a man's personal rights are sought to be imposed. At Fulton, Mo., in 1868 the license was \$50 per year. Public agitation forced it up to \$3,000 per year, reduced the saloons to two in number, cut off all sales by druggists or grocers, and made it impossible for a man to get a drink at any other place nor to get drunk anywhere, as the law forbid the sale to men in that condition, and as there were but two places where it could be had they were very careful not to involve themselves.

That either high license or prohibition hits the manufacturer "between wind and water" it is only necessary to cite their opposition to both measures.

OBSERVER.

Iowa

The Wicked Wine Cellars.

It is a fact that the leaders in four out of five churches that I have served have their wine cellars, which contain beer and wine in quantity at all times, and yet these persons were strongest of their denunciations of the sale of liquor and loudest in their prayers for the abolishment of the saloon.

Who are the sots and the wrecks in a community? Is it true that they come from the great middle class? A study of the subject will prove to any one the fallacy of the statement. The wine cellar makes more drunkards than the saloon. Again, it is a fact in communities where prohibition prevails there is as much liquor consumed as before the prohibitive law became effective.

Watch the freight and express offices in prohibition States and my assertion is made good.

(REV.) WILLIAM MOYER.

DENVER, COL.

*Rum-Soaked Porto Rico versus Prohibition Kansas.*

I was brought up by parents who would not even use cider for fear of the drink evil, and until after college days were over I was strongly prejudiced by this early training. In college I saw much of the evil effects of the traffic upon young men, for the university was situated in a wide-open city.

In 1901 I went to Porto Rico as a teacher in the Government service. I spent the better part of a year there, and learned several things about the liquor question. Indeed, no such question had ever been raised there. Rum was the source of profit in the sugar industry. Rum was served on the tables of the well to do and over the counter to the poor. Rum was drunk in lieu of milk in coffee. Even dry goods stores had a "wet" corner. The treating habit did not exist. One went into a store (there were few saloons), got one drink and rode away. During my residence I saw there scarcely a half-dozen cases of intoxication and the majority of these were Americans. A woman in the little village where I lived was distinguished from the general population as "la Borracha" (I may not have spelled this correctly), because she was frequently intoxicated.

When I left Porto Rico I went to prohibition Kansas. There I saw more drunkenness than I had seen in all my life at any one time. I went to a college town. Little occurred there, altho I learned that the "joints" were run like high license saloons, even in this staid and sober town. Once a month the keepers were arrested and fined, and it was tacitly understood that they would not be arrested for another month. I learned that this was of common occurrence in the State. I visited a few other places, and there saw prohibition at its worst. One Saturday evening I passed thru the main thorofare of a good-sized city. The saloons were doing a thriving business. There was little pretense of hiding anything. Before midnight that street looked as if they

were about to build a railway thru it and had thrown the ties along the right of way. These ties were human beings in a state of beastly intoxication. Cowboys, farm hands and others congregate in the populous centers on Saturday night and "tank up," and such scenes and worse follow.

LESLIE F. PAUL.

FORT COLLINS, COL.

*The "Stumbling Block to Temperance.*

The profits on the capital invested in the liquor traffic is the chief stumbling block to temperance. Take the "easy money" out of the trade and it would die a lingering death. That money is used to corrupt officials from constable to judge on the bench. The saloon is a breeding ground for corrupt politics. It is fighting now for its very existence.

Were the temperance people half as zealous, half as united as their opponents, another decade would see the close of the public saloon in America.

C. P. S.

COLORADO SPRINGS, COL.

*The Wages of Gin Is Breath.*

Oh, yes, prohibition prohibits, all right. The Anti-Saloon League prints maps of all the "Dry?" territory in the United States. This territory, which they claim to be "dry," is, in fact, very much overflowed. For example, the Walker Distillery, in Walkerville, Canada, across the Detroit River from us, in one recent week, paid Uncle Sam as high as \$106,000 for revenue alone on whisky shipped into this country, "more than one-half of which is under the prohibition régime," as you say. They are sending over here on the ferryboats as much as twenty truck loads of whisky per day.

Yes, prohibition prohibits all right, if your eyes are shut.

A. J. SCHULTE.

DETROIT, MICH.

*The Despised Barkeep and the Pious Druggist.*

Several times I have known the miserable sinner, the despised "barkeep," put out of business to see his occupation transferred to the respectable, pious druggist, without, in any way, lowering the latter in public esteem or subjecting him to ecclesiastical discipline.

The hypocritical character of the blatant, bibulous champions of prohibition warrants the belief that the groggy Texas advocate of the measure put the matter in a nutshell in the assertion: "Oh, prohibition is not intended for gentlemen and good church people, but for the niggers and the damned Irish."

My observation is that the enforcement of the law is rigid and strenuous against the "blind tiger" negro, who undertakes, under cover of night, competition with the negro employed by respectability.

The officer of the law has unbounded and deterrent regard for "respectability."

J. C. FOUVILLE.

MONTGOMERY, ALA.

Texas Testimony.

Previous to the year 1902 the county of Ellis, Tex., was under the license system. In that year the friends of prohibition called for a vote and the saloon was voted out by a majority of about 400. For four successive years the law was in force. That it was violated was to be expected. All laws are violated. That it was enforced as well as other statutes is not to be denied. During the four years a canvas was made which showed that there were large improvements made to the property values of the towns, and this fact was certified to by those who had been among the opponents of the measure. The nuisance of the saloon was abated. Some "blind tigers" were brought into service, but these found the place rather unhealthy. That there was a systematic effort made by the opponents of prohibition to bring the law into disrepute by frequent violations was well known by those who gave careful attention to the situation. After four years' trial, the "antis" believed that the opportune time had arrived to bring on an election and this was done. The campaign was

short and interesting. The money, supposedly from the pockets of the brewers was abundant to employ speakers, publish literature, hire brass bands and to do everything which ingenuity could invent to secure votes for the saloon. The friends of prohibition had no money except as the men of the county volunteered to give it. Speakers volunteered their services. Some were brought from other places. The result of the count of ballots showed that the majority had been increased from 400 in 1902 to 2,004 in 1906. The election had been wisely timed by the friends of the saloon when the farmers would be the busiest in their cotton. It was the season of gathering and ginning. The towns polled a very heavy vote and that of the country was light. The prohibitionists were the losers from this, and yet every precinct in the county, save one, which cast an insignificantly small vote, was carried by the prohibitionists. This result was because the people had tried both the saloon and its absence, and decidedly preferred the latter. Other counties in Texas can tell a similar experience.

CHALMERS MCPHERSON.

FORT WORTH, TEX.

The Reason for the Income Tax

BY ALBERT B. CUMMINS

UNITED STATES SENATOR FROM IOWA.

IN this country the taxing of incomes has been considered a subject to be shunned or touched upon most cautiously, except in case of war. The lack of revenue promise in the new tariff bill, however, brought it to the front during the present session. At first the issue was whether any income tax at all should be authorized by Congress; but later it resolved itself into a question of what kind of an income tax should be adopted. Personally, I have always favored a general income tax, to be paid by all persons, copartnerships and corporations with net annual earnings in excess of five thousand dollars, adjusted so that the tax would not rest upon any person unless he enjoyed such an income, even tho a part of it is derived from a corporation. On the other hand, the proposition recommended by the President and advocated by the Senate Finance Committee provides for a special income tax to be laid only upon corporations and measured by their net earnings.

The difference between the two plans is fundamental and involves the most vital principle in the authority of any government to tax its citizens and their property. The general income tax rests only upon those who have large incomes; the corporation tax may fall upon those who have very small incomes.

In either case, however, the first question is: Do we need additional revenue, and how much? One who holds the theory of tariff for revenue only may feel that the custom house receipts should be made adequate, to the exclusion of other forms of taxation. But they are very few who do not believe, today, in more or less tariff protection. The great majority heartily favor the joinder, in import duties, of protection and revenue, and must, therefore, accept an income tax as the reasonable means of supply if there results a deficiency. In the present case I am profoundly convinced that some of the import duties imposed by the bill should not have been

imposed, and that a thoroly protective measure could have been framed omitting some of the burdensome exactions which this bill lays upon the people. But the bill being what it is, the question is of the justice, expediency and necessity of an income tax, under present conditions. It is not a mere experiment for the purpose of demonstrating an abstract power of Congress. It is the necessity which we shall probably face and the fact that in the near future some of the duties imposed for revenue only will have to be reduced, and that others, for protection, will shortly disappear.

It is, of course, impossible to state with absolute precision the revenues and expenditures of the Government for the future. We can, however, arrive at approximate conclusions, as the Treasury Department arrives at them in sending to Congress its estimates for ensuing years. Taking the most conservative position, to be always on the safe side, let us glance at the prospect immediately before us, during the next two fiscal years, ending June 30, 1910 and 1911. The expenditures have already been determined in the case of the first year. We have appropriated (during the last session) \$1,044,401,857.12 to carry on the affairs of the Government for the year ending June 30, 1910. To this must be added \$26,080,875 for contracts authorized, which are equivalent to appropriation. Should Congress determine to provide for the entire cost of the Panama Canal by the issue of bonds, we can deduct the \$37,000,000 appropriated for that purpose; but from some source we must derive sufficient revenue, during the ensuing year, to cover the assured sum of \$1,033,482,732.12.

Our revenue from the Post Office Department is less than nothing. It will result in a deficit estimated at from \$16,000,000 to \$20,000,000. It is thoroly optimistic to estimate that our receipts from so-called internal revenue will be \$255,000,000. From all other sources we cannot expect more than \$64,000,000. So that, looking at it most hopefully, there will remain \$479,790,362.12 to be provided for thru custom receipts—or by some other method of taxation.

In the careful estimate which he gave in the Senate, Senator Aldrich stated that if the rates in the present bill had been applied to the imports of 1907 they would have raised \$8,000,000 more than was realized, and that our imports for the coming year would probably be as large as in 1907. We may accept his judgment as to the comparative efficiency of the two bills; but the year 1907 was one of phenomenal commercial activity, to which we shall hardly return so quickly, after the depression of 1908, and if the present bill accomplishes its purpose of encouraging home industries it is also reasonable to suppose that we shall have made some progress in supplying our markets with home productions. It is true that at present we are gaining rapidly over the revenues of 1908, from custom duties, but this is largely accounted for by the rush of importations of many articles upon which it is known that the duties are to be increased. For the first five months of the present calendar year our customs receipts, in spite of the exigencies of the case, are but 95 per centum of what they were in 1907, and it would be most unreasonable to anticipate that, for the year ending June 30, 1910, if the old rates were in effect, we could collect, at the custom houses, more than \$315,621,696. Assuming that the new bill will add \$8,000,000 upon the same importations, and that the importations will not fall off, the most hopeful prospect for June 30, 1910, is a record of custom receipts amounting to \$323,621,695, against the required \$479,790,362.12. The probable deficit of \$156,168,667.12 is one argument, from 1910, for an income tax.

In the case of 1911, much has been said of a spirit of economy which is to dominate the next session of Congress. I am persuaded that there are many opportunities for retrenchment, but it is idle to expect that if we maintain the Government as now established there can be any material reduction in our expenses. We are constantly assuming new duties, taking on new functions and receiving stronger and stronger demands in every direction for increased appropriations. There is no fair-minded man but knows that for every dollar we

can save thru the exertion of economy in the maintenance of public affairs as now established, we shall expend two dollars in the enlargement of national functions. The condition can be put even stronger, for during the last session Congress made no appropriation for the improvement of waterways, except for the continuance of work in progress, and no material appropriation for public buildings. Both will be strenuous in their demands upon the next session. The efforts of the army and navy to reduce their demands for the next session amount, largely, to postponing, for one year, such expenditures as can be delayed. It is very conservative to estimate that our appropriations for the fiscal year ending June 30, 1911, as before not including the regular Post Office appropriation or the Panama Canal, will amount to \$840,000,000.

Allowing for the natural increase in internal revenue, that receipt will be \$260,000,000. From other sources admitting \$65,000,000, and allowing \$340,000,000 from customs, which is nearly \$8,000,000 larger than it has ever been, and the deficit for 1911 will be \$175,000,000.

Even if we were to assent to a policy of despoiling the sinking fund and should we deduct \$30,000,000 for the currency fund, we should still have a deficit of \$66,168,667 and \$85,000,000, without the least hope of increasing our receipts from accustomed resources, or of diminishing our expenditures. It is, therefore, manifest that we must adopt some system that will permanently add to our revenue—and add to it more than the \$25,000,000 estimated as the result of a tax on the net earnings of corporations. We shall require all of the revenue that can be raised by a tax of 2 per centum upon all incomes above \$5,000, including gifts, bequests and inheritances.

It is a fallacy to urge that the establishment of an income tax may be used as a weapon against protection. The protective system can have no more efficient friend and ally than a permanent, well-administered income tax law. The time will come, and that before long, when protection will be possible only as it is coupled with some provision for

adding to our revenue. And as our home production multiplies under protection, our importation of competitive articles will necessarily grow comparatively less, and in order to keep up the revenue, if we have no such supplement as an income tax that is adequate, we shall be compelled to increase the import duties upon those things which we do not produce. Will the people of this country endure such a tax?

When the issue is squarely presented it will be found that the great majority will insist upon raising the additional revenue by a tax which will make those who are in the enjoyment of the greatest wealth bear a larger part of the public burden. Either we must have some such tax or protection must give way in the near future, in order that we may have a revenue from competitive importations. If we are to save protection as a governmental policy we must exercise some other taxing power. What shall it be? The general Government will never adopt as a permanent part of its system a tax apportioned among the States according to population. Nothing less than the life of free institutions will ever warrant even the temporary imposition of a tax on that basis. Our only recourse is to some form of what has been called "indirect taxation." Of these, every form of an income tax which can be laid in harmony with the decision of the Supreme Court in the "Pollock case" is so unequal, unjust and oppressive that its adoption as a permanent measure will not be accepted. We are therefore remitted, in all of our efforts for the future, to practically three forms of taxation: First, an income tax; second, an inheritance tax; third, some enlargement of what we call the internal revenue tax, such as stamp taxes and the like.

Forgetting for the moment the questioned validity of an income tax, which of the three forms is it most expedient for the Government to employ? Stamp taxes, in the very nature of things, are for emergencies, and in ordinary conditions are unjust and unfair, because they are imposed indiscriminately, and must fall in greater comparative proportion upon those who cannot afford to pay them than upon those who can. They

are extremely unpopular in America and the source of constant discontent. This leaves the income and inheritance tax—which, to my mind, should be combined, as in the amendment which I introduced in the Senate—as the only practicable resource. I have never felt that an income tax has not some objectionable features, but they are trivial and ephemeral compared with the objections to any other form of taxation. If it is evident that we must, now or in the near future, resort to some permanent form of taxation not now employed, inherent justice demands that we take incomes rather than any other kind of property, whether tangible or intangible.

The fundamental merit of the tax on incomes is that it places the burdens of government upon those who are best able to bear them. It discards unproductive property and unproductive labor, exacting but a small percentage of actual gains, profits and earnings. It exacts nothing which is needed for either the necessities or the comforts of life.

It is urged against this view that property already pays its share of the expenses of government, and in a sense it can be argued that wealth, or property, pays all the taxes that are contributed to the support of organized society, just as there are arguemnts from which the conclusion can be fairly deduced that all such contributions are really a tax upon consumption. The thought intended to be exprest by the argument is that the man who has made little accumulation of property, whose name is not on the assessment roll, is not bearing his share of the expense of government, and that if additional revenue is necessary it should be imposed upon consumption rather than on accumulated property. But the tenant practically pays the taxes assessed against his dwelling. The poorest customer of the dry goods and grocery pays the assessments against what he purchases. The workman who pays five cents to ride home, after his day of toil, pays part of the taxes laid upon the property of the street car company. Wherever we turn we reach the same conclusion, and it is my deliberate judgment that the men who accumulate

nothing carry vastly more than their fair share of the weight of government.

Every tax of which I ever heard or read, save the poll tax, is laid upon property, either tangible or intangible, and in some form falls, finally, upon the people who use or consume the property taxed. Therefore let us not fear that in putting upon incomes the duty proposed we are dealing unjustly or unfairly by the wealth of the country. It is only when the tax is imposed upon the most moderate incomes that it becomes oppressive. There is a principle which I think is recognized in all civilized governments, warranting the exemption of those incomes which are fairly required for the necessary expenses incident to the support and education of the family. As a public policy it is better to allow a man to discharge the imperative duties he owes to himself and to his family before he is called upon to discharge the duty which he owes to his Government. In dire emergencies this might be strained, but taking things as they are I do not believe that the lesser incomes should be brought within the scope of the statute. The point at which the tax should begin is largely a matter of judgment and arbitrary, but upon the whole I believe that exempting incomes of \$5,000 or less will be found more satisfactory than a smaller amount.

Realizing as I do the undoubted necessity of increased revenue, and that an income tax is the only practical method by which it can be obtained, I strenuously opposed the corporation tax and earnestly favored the adoption of the amendment establishing a tax upon all incomes over \$5,000, for several reasons. The latter is no less open to the question of constitutionality than the former, while the former has inherent weakness of its own, and objectionable features which the latter does not possess. A tax on corporations only is discriminatory and unjust. It taxes the income of certain persons whose wealth has been invested in the stock of corporations, without regard to the business in which the investment was made, or the extent of the individual income which it produces, leaving untaxed other wealth, with its income, in-

vested by other persons in the very same corporations; leaving untaxed, also, all the wealth, with its income, that is not invested in shares of the corporations, tho employed in the same kinds of business and earning an equal or larger profit, and all of the incomes from other business carried on by individuals or partners. It segregates a portion of the premiums and assessments paid by policy-holders and members of insurance companies, and taxes such accumulations, while it leaves untaxed the immense incomes from bonds, salaries, real estate and individual business.

In nearly all of the large corporate enterprises the capital is divided into two parts, the first represented by bonds, the second by stock. The first is a reasonably sure investment. The second carries all of the risks and hazards incident to commercial affairs. Steam railways, for example, aggregate almost nine billion dollars in bonds and only a little over five billion is stock; so that under the corporation tax two-thirds of the railway capital of the country is exempt. This inequality is emphasized when we remember that upon an average the stock pays a less percentage than the bonds.

I have been unable to understand how it is possible to believe it right or fair, when the purpose is to make wealth bear a part of the burden of government, to impose the entire tax upon those who have invested their money in the stock, allowing the more secure and inert in-

vestment to go free. I do not believe in any discrimination, but if I were compelled to choose between the secured capital and the unsecured from which to raise revenue, I would without hesitation select the bonds rather than the stock.

The wrong, as between the stockholder and the bondholder, is of less consequence than the wrong which is done in allowing all incomes except those derived from corporate association to go free; but there are many reasons which, it seemed to me, peremptorily prohibited discrimination against the stockholder. If the stockholder was compelled to bear the tax in every instance, the discrimination against him would be grossly unjust, but the wrong is intensified when it is remembered that with respect to very many of the corporations the tax will simply be shifted to those for whom the corporations render a service or to whom they sell their product. The railways and the public utility companies can legally shift the burden, and in the end will do so. The great industrial corporations, which we familiarly term trusts, and which dominate the field they occupy and fix the price of the commodities in which they deal, will shift the burden to the purchaser and consumer. The Government will have accomplished no more than to have commissioned these corporations to exact from a helpless people the tax imposed, with all the additions and multiplications that avarice can suggest.

WASHINGTON, D. C.

To the Little Dutch Baby

BY RUTH STERRY

O little Dutch baby across the sea,
Often and often I think of thee,
In thy bed-gown white, with thy dear eyes bright,
Looking far as eternity.

O little Dutch baby the way is steep,
And a woman's eyes were made to weep,
But a baby smile can the fates beguile—
God in his heaven can safely keep.

O little Dutch baby across the sea,
What will thy royal future be;
To be brave and good as a woman should—
This is the prayer I pray for thee!

ROSELLE PARK, N. J.

Some Impressions of Simon Newcomb

BY SOLON H. BORGLUM

[In publishing these impressions of our great astronomer by a distinguished American sculptor we are reminded of the interest taken in the impressions given to THE INDEPENDENT of President Lincoln by Frank B. Carpenter when he was painting the Signing of the Emancipation Proclamation.—EDITOR.]

ABOUT three months ago I was called to Washington to make the bust of Prof. Simon Newcomb. It was believed that he was then in a dying condition, and I realized that to catch the normal expression and record it in clay between periods of physical anguish would be a task of no little difficulty. Furthermore it was, in a sense, novel. My work had been with soldiers, statesmen and marked Western types—cowboys, sheriffs and the like—but I had never come in contact professionally with a man whose lifelong habit had been one of silent, profound thinking. Here was a man who had dealt with immutable laws, whose very nature I felt had been shaped largely by the practice of regarding everything from a scientific point of view. I was interested in seeing to what extent such a man could detach himself from his own personality, could regard the affairs of life from a wholly unsympathetic, and consequently, unbiased standpoint.

During my whole life I have stood in awe of but two things: God and learning. The scholar has always been, in my imagination, one who holds a universe in his head—one who is in close touch with the secrets of the Creator. I assumed, however, that if Professor Newcomb were really great, simplicity would be with him a marked trait. Therefore the interest and pleasure of anticipation was not marred by any feeling of awe.

Arriving in Washington I went at once to Professor Newcomb's home. He was not in. I left my card, and after transacting some business returned to the house of some friends with whom I was stopping. There I found that Professor Newcomb had called during my absence and left a card requesting an appointment for 10 o'clock the following day. I was surprised and flattered by this attention from a man of

Professor Newcomb's age—seventy-four—especially at a time when he was subject to periods of great pain. What further contributed to this delicate compliment was the fact that the great astronomer had been courted by men of distinction the world over, having actually been entertained at the palace of the German Emperor for days at a time, and having among his most valued possessions the friendship and ardent admiration of the King of Italy.

This courtesy on the part of the Professor put me at my ease at once.

I had somehow got the notion that Professor Newcomb had retired from active service and was leisurely enjoying the stored up fruits of a life of intellectual industry. But I was soon disabused of this idea. His first question on meeting me was: "Where shall we work? Here in the library, in the dining-room, or in my office?"

"Have you an office?" I said, in some surprise, and when he said, "Yes," I selected that as the best place to study him off his guard, as it were, for I observed that suffering was beginning to undermine the normal in his expression.

He took me to a house across the street that was literally filled with records of astronomical observations.

"I expected to find some instruments here," I said, presently.

"Haven't used one for years," he replied, briefly; "my men do that. I devote my time to making calculations based on their observations."

I took a position with my clay in a certain part of the room, prepared to study the Professor. My first business was to put him at his ease, disabuse him of the idea that he must pose like a sitter in a photograph gallery—for this was what he seemed to think. I suggested that he pay no attention to me whatever, but go about his business answering letters, making calculations, absenting him-

self from the room whenever he felt like it; in brief, follow out his regular daily routine. The suggestion seemed to relieve him. He immediately called his stenographer and went to work at his correspondence.

For two or three days I touched the clay but little, devoting the whole time to observing the astronomer as he went about his work, and he now seemed to be as unconcerned about my presence as if it were that of a clerk.

I noted particularly the wonderfully systematized mind of the man. All facts seemed to be arranged and classified mentally. His memory was nothing short of marvelous, but this I surmised was greatly assisted by his method of work. In dictating he would call off a number of important figures. When the paper was finished he would, with unerring precision, direct one of his clerks to go to a certain shelf and find a certain book. When this was brought he would quickly turn to a page and instantly put his finger on the figures that verified those he had dictated. He did this again and again, and tho I watched with the keenest interest, I did not detect an error in the figures he had put down apparently offhand.

My study of the Professor was constantly interrupted by the recurring periods of intense pain from which he suffered. When one of these occurred it was some minutes before his normal expression returned.

From time to time, as he dictated answers, Professor Newcomb made comments upon the letters to which they related. Apparently he was in correspondence with astronomers in his own class in various parts of the world. One letter was from a Frenchman asking for a book containing certain figures. The Professor smiled grimly as he commented that the information sought was contained in one of his own—Newcomb's—books which was in the Frenchman's library, and that he half suspected that his friend was using the request as a flattering little trick to get a personal communication from him. On another occasion he referred humorously to the habit that foreign scientists had of making careful notes of everything he said in conversation; that is, when he was talking with them in groups. Like most

modest men, he didn't seem to realize how important his words were.

Apparently trivial bits of talk put us on a more companionable basis, which is so essential to the sculptor in the study of a subject. I was glad when Professor Newcomb had finished the official work at hand each day, for then I felt free to engage him in such talk as would draw him out and make him forget pain. He was eternally hopeful, valiantly fighting off or refusing to recognize the fatal malady that was sapping his life. In fact, I believe that at that time he was not aware of its nature. Almost every day he wrote to some distinguished physician asking for advice as to how to treat the disease. The letters that he dictated to the doctors were to me, who had been made acquainted with his trouble by those who understood it, exceedingly pathetic in their fatuous hopefulness. And the answers that he received kept him buoyed up to within a short time before his death.

The Professor's methods of speech I observed were particularly characteristic of the thinker—deliberate, precise, systematic. He had the gift of expressing profound—one might say scientific—thoughts in popular terms. This I marked particularly on hearing him dictate letters to professional men where he might excusably have used technical terms. I was amazed on hearing such dictations at the ease with which I, who have no acquaintance with astronomical terms, followed his line of thought. Perhaps this gift had been developed by the writing of textbooks for the uninitiated.

On another occasion Professor Newcomb dictated a letter, the contents of which I am not at liberty to state, which gave me a curious insight into the man's character. It related to a certain move on the part of the Government of which he had been a lifelong and peculiarly interested advocate. The enthusiasm with which he entered into the writing of the letter, which lasted perhaps an hour, either made him forget or carried him over the frequent periods of intense anguish that attacked him. Further than this, he seemed to be dictating with an eye to the future, evidently feeling that his letter would be used in Congress, and with this end in view couched a highly scientific, technical communication in

terms that could not fail to be understood by the most unlearned man in the national legislature. This showed me that the Professor was not only a great savant, so far as the heavenly bodies were concerned, but a wise judge of men and affairs.

During our little talks after routine work I got many glimpses of the softer side of the man, glimpses that were unsuggested in the photographs or portraits that I had seen—his human side. Once he said, with some degree of feeling, how little the great men of the world were understood and appreciated by the public at large, and then, suspecting that I might sense a note of personal disappointment in his words, he added quickly: "See the German Emperor, for instance—how little the world understands him." Then he grew enthusiastic. "Look at him!" he exclaimed; "if you didn't know he was Emperor you'd never suspect it." I was glad that he'd touched upon this subject, for the Emperor's name acted like magic with him. The stars were forgotten—he came down to earth. "The Emperor's the best of fellows," he said; "all this talk about his arrogance is rubbish. He's the least pompous of men. On occasions when I've been at his table with other men of science he has invariably detached himself from his personality as Emperor and has become one of the crowd, as it were. He has a wonderfully alert mind, a marvelous knowledge of technology, a quick grasp of what he did not know before. For sensational purposes, many trifling acts of his are exaggerated and set forth, and the public at large judges

him by them. But this is no criterion of the man. He is not only magnificently equipped in the matter of education, but an able and profound thinker." The Professor paused a moment, then went on: "The Emperor touched a responsive and sympathetic chord in me when he showed me by his words that he realized what the world was saying about him, and when he clearly endeavored by his actions to disabuse me of any ideas that I might have formed of the less serious side of his character."

Naturally, having discovered the magic of the German Emperor's personality, I availed of it to arouse Professor Newcomb to animated interest in things whenever his thoughts seemed to revert to his own trouble and superinduce the touch of melancholy of expression which I was so anxious to avoid.

Another thing that impressed me about Professor Newcomb was his positiveness of statement, so characteristic of the mathematician. Once when I ventured to ask him what he thought of the canals of Mars, he answered emphatically: "Those are not canals; they are clearly marked depressions in the surface of the planet."

One day I noticed a great vase standing in the corner of his room. It was a gift from the Czar of Russia, a mark of appreciation of some considerable service Newcomb had rendered the astronomers of that land.

"What is the vase?" said I.

"Jasper," he replied.

"And why jasper?"

"It's my birth stone. Tactful compliment, wasn't it?"

NEW YORK CITY.

A Degree

BY JOHN H. PEARSON

SAMUEL GRIDLEY HOWE, A. B., BROWN, 1881

JULIA WARD HOWE, *his wife*, PH.D., BROWN, 1900

Oh, graceful act, that linked the living June
With that far, unremembered afternoon

And Brown's young knight that helped set Hellas free!
Our Lady of the Hymn, whose lofty rime
A loyal nation chants, has conquered Time!

Was his abyss e'er bridged so graciously?

Philosophy Among the Weeds

BY E. P. POWELL

AUTHOR OF "THE COUNTRY HOME," ETC.

I HAD the idea in my boyhood that weeds grew only to keep me busy in the onion bed, just when I wanted to go fishing. There are some weeds just mean enough for that, so I still believe; but in general I have found out that Nature knows very well what she is about, in sowing and growing these things, which we think we have no use for. In the first place, most of them have some specific adaptability, which we have to find out, and it does us a vast deal of good to keep on a still hunt of this sort. Only the other day, when I was nearly seventy, I found out that pigweed made splendid greens, and in Florida scoke is called the Southern spinach. Now these two plants look very different to me from what they did formerly, when I only made ink of the crimson berries and read Thoreau's enthusiastic description of poke color in October.

I have a row of scoke or poke four rods long in my garden for February greens. Then the sorrel, which with us is only another weed, down there comes up so swiftly and grows so rapidly that it is another delicious table food. Like our Northern dandelion, it is also a capital food for fowls. A yard of twenty hens will devour three bushels in a day, if thrown to them. In this way Nature has a lot of fine balances, and we shall probably keep on discovering them till most of our weeds are put to direct use. Chickweed is excellent bird and hen feed, and what is nicer than to see a flock of goldfinches cracking the seed of a field of bull thistles? In Florida, in a maze of all sorts of vegetation, I came on a bunch of bull thistles, and it was the prettiest thing, just then, I had ever seen. It stood for all New England and New York; so I let it grow, but it seeded, and there were no goldfinches to eat the seed, and it spread so that in two years it gave me a job to extirpate it.

It did bring me a genuine bumblebee, and I now had a substitute for the goldfinches.

But what I want you to see is that Nature has not just gone ahead making things without a reason; that is, with only one out of a hundred or a thousand worth the while. These weeds have a nice, logical purpose, and they will all get explained in due time; only it will take considerable thinking to find it all out. Meanwhile, if you and I cannot use these things ourselves, Nature will use them for somebody or something else. The philosophy of field culture or farming is to make soil, and the only thoroughgoing farmer is Nature herself. She works to the end of soil making all the time and every time, and for that purpose every weed counts. If we cannot use them individually and separately, we can in the lump. I have a grudge against any one who wastes one of my weeds. I do not wish to have it burned nor thrown in the road. It is property, it is wealth, and therefore should go into the compost pile. That weed stands for so much carbon, so much phosphorus, so much potash and some nitrogen; and these are the food for my corn and beans and potatoes; and after that for my cow and myself. When a whole State full of people burn up all the weeds that grow during the whole year, they are simply stupid; and when, after that, they buy at a big cost a lot of commercial fertilizer to do a fraction of what the weeds would have done if composted, they are criminally ignorant.

Why do thistles have pricklers and why do berries have thorns? Evidently so that the plants can get large, and not only propagate themselves by seed, but make more compost. You will be amazed when you begin this compost business, to find what an enormous mass you can accumulate in the course of a year from common weeds. Gather them from your garden and from the roadside, put with them your barnyard manure, and then all the loads of autumn leaves that you can collect, and my word for it you will have something a deal better than you can buy. This does

not teach the neglect of hoeing out weeds or letting them go to seed. On the contrary, you want them when full of juice. Mow them, hoe them, and stack them as surely as you do your hay. I do not say let weeds boss you or quack grass whip you; only use every pound of them that you can get while cultivating your crops. An old pasture has a deal of money in the old mulleins and thistles and catnip, and whatever else the cattle and horses will not eat. It will take but little time to mow these while green and add them to the compost heap. So you see that, instead of counting weeds out as totally a nuisance, I count them into the annual valuations of the farm. Let us come to an understanding with them; they shall have the corners only, and only long enough to have become good soil-making stuff.

I was riding on a trolley car yesterday, and I heard the word humus repeated by some one behind me. He was with great emphasis and interest telling his fellow passenger, who happened to be a lawyer, how the land needed humus. "Commercial fertilizer is well enough on a pinch," he said, "but at best it is little more than a whip on tired soil. By and by it has got all it can out of the soil, and has put nothing in. In a few years the man who relies upon it for his crops finds his land exhausted. What we want is humus; incipient soil. We must create more soil; have it always in the making. And that can be done by adding humus every year." "What is humus?" said his neighbor; and as near as I could make out, the farmer called humus raw material—soil in all stages of the making; on the road and in the garden, weeds, but when composted and decomposed slowly, and without serious ferment, the most perfect plant food. This man had learned not to waste half-way stuff. Humus, meanwhile, before its disintegration, holds moisture in the soil and equalizes the temperature among the roots of trees and plants. Humus is a new word among farmers, and I am glad to know that it is becoming a common word, defining a new conception of weeds.

We are learning that to throw manure or plant food all over a meadow and let the coarse part dry up, is very foolish;

and it is equally uneconomical to make roads out of plant stuff. The Southern Crackers do a good deal better than this when they fill great furrows full of this waste stuff, cover it up by plowing dirt over it, and grow their sweet potatoes in the ridges that are made. It gives the best possible crop. In 1907 I grew a sweet potato weighing eighteen pounds in a compost pile.

Once more, in Florida, I find a class of weeds that serve as a cover crop against the heat of summer. This is just as much needed as a cover crop against the cold in our Northern orchards. The sand conducts the heat of noonday down six inches into the soil, where the fine and fibrous roots are scorched and shriveled. Nature will look out for this if you will let her, for she carefully spreads all over the soil a mat of sensitive plant and sorrel weeds that really do no harm, but are admirable protection against the midday heat. Here in the North that comes up in October, may be wisely left not only to hold the soil from washing during the coming winter, but as a cover crop as well. We may, in addition, sow our vetches, but the weeds do what they can to assist us. We owe these rapid growing and spreading plants warm thanks for their service. I tried them once in my strawberry bed, but I never got them out again until I dug up the whole bed, strawberries and chickweed together.

Yesterday being the Fourth of July, I went with my boys over the hills for wild strawberries. I found the very knoll and little knobs where, seventy years ago, I picked strawberries with my father. The superb valley lay before me just as it did then, but the big old pasture is now devoted to an experiment in forestry by Senator Elihu Root. The stems of dark crimson berries stood higher than some of his newly planted trees, and even over the grass that was choked by the vines. There were rods, if not acres, of these berry plots. I could not see that anything was eating the fruit, more than an occasional slug. The plants were simply a weed, creeping up hill and sideways, letting themselves down hill slowly link by link, and taking possession of the larger part of the pasture. I had not thought of that when a

boy, for I supposed that weeds were weeds, and of no use whatever. After filling my large basket with beautiful stems, I sat down on a mound and looked over the slope and in the creek lands counted the houses, and then studied the villages on the opposite hills. But mostly I noted how the folk had cut down woods and destroyed what was forest; and I noted farther that the old maple-crowned hills were growing barren. The soil had been washing down into the valley until not even weeds could be seen to hold it.

The crows in the tops of the beeches jawed me, and my boys found an oven-bird's nest, but I was busy learning the lesson of the weeds. Red raspberries bordered the woods, and when I was a boy they were all that we had; but now the superb Cuthbert and Golden Queen and Schaffer's Colossal take up much of my garden land, giving me \$300 an acre, where potatoes once gave \$50 an acre; weeds again. Going home thru the grove, I came upon a few roots of ginseng, a weed that is now adding many thousands of dollars to American income. At the eastern edge of the forest I found a quart of mushrooms; only toadstools once. What is going to be the end of this? The world is a treasure house, and we imagine that our grandfather Adam was driven out of Eden because he was so inquisitive about what was growing there; and I am expected to believe that Jehovah likes the smell of lamb more than that of a blackberry pie or a strawberry shortcake; if not, what does the story of Cain and Abel mean. I am very sympathetic with the fellow that grew turnips and potatoes, and planted the first gardens of apples and pears. I suspect it was Cain.

My Florida yard has a general spread of two acres, which is not all taken up with the great pine trees. Naturally I intended to try to secure a fine soil. There were as many varieties of weeds as I have ever seen, and of every style and height. But in February some of these begin to blossom, and they were followed by others of great beauty, until I found myself in possession of as fine a wild flower garden as care could have created. There were violas on stems a foot long and as blue as the sky, lifted

over the tiniest white violets that crept close to the soil. There were sensitive plants throwing out their interlacing arms of delicate tracery until they fairly carpeted the soil in pink. Up went stalks of yellow and blue and white and lavender, and it was an every morning joy to go out and meet the new ones. I did not know their names, and was glad I did not; they were simply children of Nature. Grandest of all, the Cherokee bean had square yards of superb carmine overlooking all the rest. Legumes of every imaginable style were feeding on the air, and passing the nitrogen down to be stored in my soil. So, taking only room here and there for beds of roses, gladioluses, cannas, and other civilized plants, I left the weeds to bloom away.

Crab grass is a very valuable affair in the Southern States, because it does not have to be sown, but it comes up of itself after the early cabbage and lettuce has been marketed, and the midsummer crop removed—making a fine fodder or pasture, and thru the hottest months of the year a summer cover crop. Yet a Government bulletin of not old date counts crab grass as one of the five or six worst weeds in America. In the West I have seen carpets of blue lupins and other great lawns of scarlet lobelia, but both of these are now employed for human service. In the South the pest of the cotton fields was called beggar-weed. Beggar it still is in name, but it has become the best hay plant in Georgia and in Florida. It is the delight of horses, beside being a legume that does not rob the soil, only adding to its fertility. The velvet bean, another legume, used at first for covering negroes' huts, and growing 50 feet in a season, is now one of the very best of all forage plants, giving three or four cuttings of hay, besides pasturage, and then, when plowed under, adding a great store of humus and of nitrogen to the soil.

The sweet potato is only an improved morning glory, and the Irish potato is an improved solanum. Both are constantly on the march of improvement, but, as they are, our population would have a hard time at it without them. They were weeds, but now they are the two roots on which human beings most

depend. We shall find out the secret of a host more of these wild pests. It is extremely probable that some day, and almost any day, we shall uncover the hidden power of something else that will double the feeding power of the vegetable world. The French use our purslane for greens, and it is the only consolation I can find when hoeing the ground over for the fifth time that something "as mean as pusly" is a first-rate food for the table. The dandelion runs out our meadows, but Professor Clark says that "Nature knew what she was about in making the dandelion, and never made one too many." We are slowly learning how to improve it and to cultivate it, and to ship it into the cities as a panacea for a class of ills we call biliousness. A few years ago I cut a field of ox-eyed daisies while they were green and full of oil, and fed them to my pet cow. The result was that I quickly spoiled her for milk, but made her fat enough for beef. The lesson was not pleasant, but I found out what daisies were good for. Mow them green and they will fatten cattle better than beets. The invasion of the Russian thistle thru-out the Northwest was met by such alarm that an appeal was made to the National Government for help to exterminate it. I believe the farmers of that section have gotten quite over the scare, and know very well what to do to transform this weed into practical utility.

Pretty soon we shall become more largely vegetarians, for we are coming into an era that cannot afford range room for large herds of cattle nor give over half a State to flocks of sheep. Private enterprise will be even more hampered in the way of meat production, for intensive farming is sure to win the day. In Florida we are slowly eliminating the free-browsing herds. The Northern home-seeker is spreading over the orange-growing sections, and the

Cracker himself opens milk routes. Every acre of tillable land in the United States will, within thirty years, be preempted for the plow or the orchard. We shall have only room for our milch cows, and they will be fed by soiling, while the sheep will have the range of our orchards; but a rapidly increasing population will forbid any broad ranges, where the shepherd can feel at home. Cain is surely displacing Abel. Weeds must enter a good deal more freely into consumption, and those which are implacable to civilization and not finally adaptable by the busy farmer and the hungry citizen must be eliminated.

The latest news from the food laboratory is that alfalfa leaves can be ground into a meal for human food, and that this meal contains more protein than is contained in meat. If alfalfa, why not beggar-weed, which is rich in sugar; and why not some of the congeners of this great legume and fodder, which are still weeds. Here is a great field opening before us, the farther edge of which we cannot see. Our population is likely to become somewhere near two hundred and fifty millions before the end of the twentieth century. All these people have to be fed, and well fed, or the race will degenerate. Either the Malthusian theory is correct, and wars with pestilence are a blessing to keep down the overplus that cannot be fed, or we must open new and vast supplies. Nature has probably made no mistake, and will arrange for a balance between her energies. Conserving the products of the ocean, combined with intensive cultivation of the land, may at least lift the weight on present population; while improvement in seed, greatly increased economy in place of waste, together with a more complete mastery secured over insects, may even double our present population and feed it; but for the millions beyond that we must look to a new elevation of weeds.

CLINTON, N. Y.

Women's Clubs

BY IDA HUSTED HARPER

Author of "The History of Women's Societies"

THE International Council, which has just closed its third quinquennial in Toronto, Canada, represents the apotheosis of the club movement among women. Just one more than forty years ago the first "woman's club" sprang full-armed into the arena occupied exclusively by men, and Sorosis centered all eyes on New York, challenged the criticism of the world and received it. "If this club can hold together one year," said an editorial in a leading New York paper, "a good many people will find it necessary to revise their opinion of women."

Sorosis still continues to hold its regular sessions and a good many people are still annually revising their opinion of women. In New York City 50,000 belong to the Federation of Women's Clubs, 80,000 in the State, 1,000,000 in the nation—and these are very far from representing the full number of club-women. How many are included in the International Council, which has just held its session in Toronto, cannot be determined, as it is composed of national associations only, but the individual membership of these is estimated at about 7,000,000. Every form of organized activity is represented, and delegates from these widely diverse bodies, in all parts of the globe, speaking many different tongues, have been coming together in harmony and helpfulness for over twenty years. Every five years officers are elected, and two meetings are held in the interim. There was once a belief that even a church sewing society could not avoid petty squabbles, but that was when women were forced to lead petty lives. Broad opportunities make broad people, and whenever a new one is given to women the world is obliged to "revise its opinions," so that now there is a large revised edition, with room still in the index for an appendix.

In 1884 the Canadian delegates came to Berlin with an invitation to hold the

next quinquennial in Toronto, which was accepted, but when that magnificent congress was ended they would gladly have withdrawn it, for they felt that no city ever could equal the splendid entertainment of Berlin. The present meeting has illustrated anew that there may be just as much hospitality and enjoyment in a cottage as in a palace. A city of 200,000 people which offers the comforts of its individual homes to three hundred delegates for two weeks establishes an unsurpassed record. The beautiful university where the meetings have been held has surrounded them with a fine scholastic atmosphere; the "sweet girl graduates" have been ideal ushers, and the charming social courtesies—the teas, receptions, club fêtes and garden parties—have made the city forever one of delightful memories; while, for something on a gigantic scale, what could Berlin offer equal to the trip to Niagara Falls?

It is indeed a marvelous change from the anathema heaped upon Sorosis, the forerunner, to the eulogies on the International Council, with many women still in active life who have heard them both! About twenty countries are now affiliated in this great world movement. Neither cable nor wireless telegraph can produce such a bond of union as that created by the actual meeting in a common cause of women from Argentina, Italy, Austria, Finland, France, on Canadian soil in this new country of a new world. Parliamentary congresses of men, voluminous pamphlets, eloquent editorials for the uniting of all English-speaking nations, are cold, hard and ineffective methods compared to the literal coming together of representative women from Great Britain, South Africa, Australasia, the United States and Canada for the mutual purpose of improving conditions and raising the standards of English-speaking races. Such has been their mission in the International Council, which was founded in the

United States and has had a British woman for president during sixteen of its twenty-one years' existence.

The four women who may justly be called the founders of the Council—Elizabeth Cady Stanton, Susan B. Anthony, May Wright Sewall and Rachel Foster Avery—were all pronounced advocates of woman suffrage, officers of the National Association; but in order to bring in all kinds of organizations, they sagaciously kept this question in the background, knowing well that it was only a matter of time until it would dominate all others. So widely divergent were the ideas of women in those days, and so little had they united in organized work, that it was practicable to form but two standing committees, representing what those of all countries were willing to accept as legitimate Council work—one on Legal Position of Women and one on Arbitration. It was not until 1904 that the women of Europe had become broad and courageous enough to change the latter to Peace and Arbitration, and this action was taken at the Berlin Congress, in the very heart of the most warlike of nations.

The most remarkable evolution of sentiment, however, was in regard to woman suffrage, not the result of propaganda, but of the dearly bought experience of women, who, undertaking work of a public nature for the first time, found themselves hampered at every turn by the lack of political power. In 1903 those shrewd old suffragists saw that the time was ripe, and to the national councils of every country was sent the official query, "Shall the International Council adopt work for woman suffrage as a part of its program?" The answer was almost unanimously in the affirmative, and the next year, in the capital of the German Empire, where women have no form of the franchise, the great Council passed unanimously a resolution that "strenuous efforts should be made to enable women to obtain the power of voting in all countries where a representative government exists." A standing committee was formed on Suffrage and the Rights of Citizenship, with the Rev. Anna Howard Shaw, of the United States, chairman. Here, too, in a country where a double standard of

morals is almost universally accepted, the Council formed a standing committee on the White Slave Traffic and Equal Moral Standard, and declared officially that to suppress the first and secure the last should be part of its official work.

Coming now to the meeting in Toronto five years later, one sees still further progress. In their work along the lines of the so-called "social evil," the women found that it had not reduced to slavery white girls alone, but counted among its victims Chinese, Japanese and negroes, who had an equal right to their help. The name of their committee, therefore, has been changed to Equal Moral Standards and Traffic in Women. A curious situation developed here in the discussion on the report of the Peace and Arbitration Committee. A petition had been freely signed during the congress, asking the next Hague Conference to secure from the nations an agreement to submit all differences to arbitration. There was a very large majority vote to set apart one day each year for great meetings in the interest of peace, but no argument, persuasion or diplomacy could secure a favorable vote for "a limitation of armaments leading toward the abolition of standing armies and navies beyond the necessary policing of land and sea." After two hours of heated discussion it became necessary to lay the resolution on the table. It is not clear what inferences should be drawn from this incident. It disproves the oft-repeated assertion that women are governed entirely by sentiment and could not be relied upon to defend their country in time of danger; it proves the just as frequently repeated assertion that women would think and vote very much as do the men of their respective countries, for the European women largely opposed disarmament, and those of the United States were unanimously in favor of it. This, however, by no means indicates that women take this position simply because men do, but only that both are influenced by the same conditions.

The moment women are granted the franchise they become a vital factor, as may be conclusively demonstrated in those countries where they possess the franchise. Australia and Norway, for

instance, sent women as representatives of the Government to this meeting of the International Council and will ask for official reports on their return.

The leaders of the woman suffrage movement may be pardoned a bit of malicious satisfaction at the triumphant success of the suffrage session of the Council, the largest and most enthusiastic of any during the two weeks. For some mysterious reason a delegation of Canadian women went to the preliminary meeting in Geneva last year prepared to eliminate the word "suffrage" from the standing committee, leaving only Rights of Citizenship, and to prevent the executive board from putting a woman suffrage session on the program of the Toronto congress. The United States delegates were on hand at Geneva in full force—twelve of them—headed by Dr. Anna Shaw, chairman of the committee. They did their work so effectively that the question of changing the name never came to a vote, and the executive committee agreed to give an entire evening at Toronto to the consideration of woman suffrage. The Council here reiterated its demand for the franchise in the strongest possible language, forever establishing its position on this subject. In addition it called upon the governments to "place women on all boards and committees dealing with public work." While the Countess of Aberdeen had always expressed herself as favorable to the enfranchisement of women, she never had made such public declarations as the leaders desired, but at the close of this remarkable suffrage meeting she rose and said:

"At the present time when my husband occupies the position he does [Lord Lieutenant of Ireland], it is not considered desirable that I should speak on any subject of public controversy. But tonight, as president of the great council binding together so many women workers of the world, when they again solemnly reiterate their conviction that the granting of the franchise to women is the basis of all further progress, I cannot keep silent. It

has always seemed to me non-understandable why a bogie has been made of this question. Within a few years suffrage will be granted to women in most countries having representative government, and they will then be in the position of being able to do their whole duty to the home, the community and the country."

This strong declaration was then followed by an earnest plea for the ballot as especially needful for the salary and wage-earning women.

Would woman suffrage really make the world any better? Partly at least is this question answered. "The most appropriate motto for the Council would be, 'All for the common good of woman-kind,'" said the *Toronto News*. "Its supreme object is to improve social and industrial conditions," said another paper, "and its official motto is the Golden Rule." "But these are exceptional women," it may be said. Then, since there are 7,000,000 exceptional women in one organization, it seems as if it might be safe to make the experiment of giving women a voice in the Government.

Many subjects important to women, from Education, Marriage Laws and Prison Reform to Domestic Science and Handicrafts, were discussed by women who spoke from wide experience. The congress was addressed also by men of high distinction. It was, however, pre-eminently a woman's meeting, and in themselves these delegates represented the evolution of twoscore years. There were women lawyers, ministers, physicians, surgeons, dentists, architects, university professors, college presidents, editors, bankers, founders and presidents of organizations, members of public boards, street and factory inspectors; while, fraternizing with them in a spirit of equality alike creditable to both, were ladies of high titled rank.

Sweden will entertain the distinguished company in 1911, and the next quinquennial will assemble its forces under the sunny skies of Italy.

The Danger of Books

BY HAROLD E. GORST

AUTHOR OF "THE CURSE OF EDUCATION," "THE PHILOSOPHY OF MAKING LOVE," ETC.

IF a philanthropist established depots in every district of New York, where children could go at all hours and stuff themselves, to their hearts' content, with beef, mutton, lobster salad, cheese, cake and ice cream, there would be a medical congress, the issue of warning leaflets to the uninformed public, a press outcry, and drastic action by the President. It would be pointed out that food, when taken in excessive quantities, poisoned the system with gout, rheumatism, and other evils; and that the production of healthy, sound bodies depended upon a proper scientific diet. The pernicious results of this mistaken philanthropy would obtrude themselves so obviously upon the notice of parents and others, that nobody would rest until an effectual stop had been put to it.

The mind is no less valuable than the body, and its healthy condition is equally dependent upon common-sense treatment. Few people appear to pay attention to the principles which govern its functions, and most of them would probably scout the idea that the normal working of the mind actually produces originality of thought. Such being the case, it is scarcely subject for wonder that books should be almost thrown at people's heads at every street corner, and that public authorities, philanthropists, parents and teachers should vie with one another in thrusting all kinds of literature upon babies, children, youths, maidens and adults, indiscriminately.

Yet there is probably nothing upon earth more hopelessly destructive of the mind, and its ordinary mental processes, than the serious literature, with an educative purpose, which it is the highest moral aim of the librarian or instructor to put into the hands of the reader. Fiction does infinitely less harm to the mind than

the most solid and informative work. The average modern novel has, scattered over its three hundred pages or more, at most half a dozen statements or reflections for the mind of the reader to assimilate. You cannot get mental indigestion from reading the fiction of today. Possibly you may obtain false views of life; but these are easily corrected through personal experience. There is nothing, at any rate, to inflict a permanent injury upon the mind by drastic interference with its normal working. All, therefore, that can be urged against the reading of novels and romances is that a great deal of it is sheer waste of time. The virtues of the practice are for the most part negative; they are positive in so far as they help to keep the imagination alive and to provide the mental faculties with gentle exercise.

Of what, then, does the normal process by which the mind works consist? It consists of the exercise of three functions: observation, reflection, and creation. First of all the mind observes. That is to say, it takes in some fact, or some idea or suggestion. There are, of course, various ways in which this can be done, either by sight, by hearing, or by touch. Then it sets to work upon the material it has imbibed, absorbing it and interweaving it—a more or less unconscious process—with other materials already stored in the brain. Last of all comes the supreme function: the mind gives out in an original form—that is, with the impress of individuality—a creation of its own, some new contribution, on however humble a plane, to human thought and human progress. To enable it to perform these functions, the mind requires to be fed. But, altho books are no doubt an essential part of a well-balanced mental diet, they are apt to para-

lyze the normal working of the mind, in the most pernicious and unhealthy way, unless approached with the utmost care.

The chief harm of books lies in the filling of the mind with solid chunks of undigested material. Nobody—except, perhaps, a successful lawyer trained to the assimilation of briefs—could possibly read and digest three or four pages of raw facts, such as are set out in a history or other textbook. A "Short History of the English People" lies on my desk. I open a page at random, and find the following record of events:

"For three years, from 1779 to 1782, General Eliott held against famine and bombardment the rock fortress of Gibraltar. Altho a quarrel over the right of search banded Holland and the Courts of the North in an armed neutrality against her, and added the Dutch fleet to the number of her assailants, England held her own at sea. Even in America the fortune of war seemed to turn. After Burgoyne's surrender the English generals had withdrawn from Pennsylvania, and bent all their efforts on the South, where a strong royalist party still existed. The capture of Charlestown and the successes of Lord Cornwallis in 1780 were rendered fruitless by the obstinate resistance of General Greene; but the States were weakened by bankruptcy, and unnerved by hopes of aid from France. Meanwhile England was winning new triumphs in the East. Since the day of Plassey, India had been fast passing into the hands of the merchant company, etc."

Nine readers out of ten would be unable, five minutes after reading the above, to distinguish between any of the four generals mentioned; and the majority of them would probably carry away with them a hazy idea that Pennsylvania was somehow connected with the conquest of India by American troops from the South aided by a Dutch fleet. The mind cannot grasp or retain such an ill-assorted jumble of uninteresting facts; and the school system consequently falls back upon an actively harmful method of cramming them in undigested, just timed to linger on in the memory—like an unfixed negative—until the examination disperses all knowledge to the four winds. History written without any sense of perspective confuses the mind, does no real harm,

and helps to destroy it; whilst the accuracy of the historian depends, not upon the veracity of his statements, but upon the truth of the picture which he impresses upon the reader's brain. The most conscientious and veracious chronicler may circulate, thru the medium of a badly presented array of strictly accurate facts, a tissue of everlasting lies. The bad artist dealing in truths is a vastly greater liar than the craftsman fashioning falsehood with a master hand.

Apart from the individual harm done by each book, modern culture aims at the widest possible range of reading. If the most voracious seeker after knowledge were to read one-tenth of the books which are habitually quoted as being indispensable to the cultivated individual, he would have no mind of his own. He would degenerate rapidly into a pale and flabby reflection of the standard authorities. What is the use of such a mind—if mind it can be called? Does such an individual—there are scores and hundreds of them to be met, both male and female, wherever intellectual conversation is a stereotyped item of the luncheon or dinner menu—contribute one iota to the progress of the world? The beer-sodden autocrat of the village pothouse, hiccupping forth some home-brewed blasphemy against the established order, makes a definite contribution toward the sum of human thought; whereas the political figurehead, repeating a well-worn platitude with pompous wisdom, contributes nothing at all.

Two persons go to a great industrial exhibition. One of them spends five hours in trotting round everywhere, in order to see as much as possible. The other selects one little corner of the exhibition, sits down and studies his surroundings for the same space of time. What happens? The first one goes away, tired out, with a vague and superficial impression of lights, crowds, exhibits and boredom. Number Two has used his mind and enriched his experience. If both individuals were to write a descriptive account of what they had observed, one would produce a hackneyed description of commonplace scenes, whilst the other would have something original to say, possibly out of the beaten track and therefore of lit-

erary value. Most, if not all, of the masterpieces of literature have resulted from this artistic limitation and concentration of the mind; which is nothing more, after all, than a plain observance, on the part of the individual, of the eternal laws which govern its normal working.

Apply this to reading and you get the same results. You might receive no education at all from devouring fifty books of the most approved type; and you might get a perfect education thru learning to read and digest one with intelligence—that is to say, by applying your own powers of reflection and thus regulating the load of material thrown upon the mind. Not only cannot the mind develop originality, but it cannot work at all, if it be systematically choked up with facts and with the ideas and opinions of others. Books are therefore absolutely dangerous to healthy mental development. Even the most admirably balanced books, where the artistic presentation of the material ensures its ready absorption by the mind, can act upon the individual in a highly detrimental fashion. A few weeks ago a lady put into my hands a book called "The Lost Art of Reading," and earnestly recommended its contents to me. I had not read three pages of the book before I shut it up with a snap and returned it to the owner. A simple glance was sufficient warning. Had I read the book from cover to cover there would probably have been an end, so far as I was concerned, to all original reflection on the subject, of which it evidently treated in the most masterly and interesting way. I shall look forward to reading it when I am growing ancient and decrepit, and the creaking hinges of my own mind warn me that its creative machinery is getting rusty with age.

Ask any self-respecting journalist what he does when an editor commissions him to write an article on a certain topic. Let us suppose him to be largely

ignorant of the subject in question. Does he fly at once to books and similar sources of information in order to gather material in the shape of facts and ready-made opinions? Not if he understands his business and knows that elementary principle of the successful writer—how to preserve freshness of mind. He retires to a secluded spot, far from books and men's voices, settles himself into a comfortable chair, lights a cigaret, and thinks. His first instinct is to fathom his own mind, and to see whether there may not be concealed, in its recesses, some original reflections connected with the topic about which he has been asked to write. The probability is that something lurks there, and that the creative faculty will set to work and produce, from some long digested but forgotten scrap of material, an interesting and purely individual train of thought. A few newly acquired facts, gathered after this initial process, may help to garnish the literary dish; but had they been sought in the first instance they would only have served effectually to smother up any original reflections which had been unconsciously formed in the mind.

Let no man, therefore, be proud of the number of books that he has read. He should rather be ashamed of having had such liberal recourse, not to his own thinking powers, but to the opinions and reflections of other people. Is it more noble to quote Herbert Spencer or Emerson than to quote yourself? Is it more useful? It is a false conception of culture to regard the individual as best educated who possesses the largest fund of borrowed wisdom. The man who should first be honored is he who thinks for himself, and who delegates that task to nobody else. The most despised person should be the man who, instead of meeting all difficulties with the might of his own clear vision, hides ignominiously behind the clarion-voiced philosophers and thinkers of his own generation or of some bygone age.

NEW YORK CITY.

Co-operation

MR. FAY has made a thoro inquiry into the co-operative movement in England and on the Continent.¹ He has traveled extensively, has attended congresses, interviewed officials and has studied with care the authoritative pamphlets and reports.

He distinguishes sharply between combination and co-operation. No doubt there is a likeness of structure between certain forms of combination and certain kinds of co-operative societies. "But," he writes,

"while the combination is an association of the strong to become yet stronger, bold, unyielding and exclusive, the co-operative society is an association of the weak who gather together and try to lift themselves and others out of weakness into strength. Industrial combination is a force: co-operation is an idea.

Co-operative societies he divides into four classes: banks, or credit societies; agricultural societies, workers' societies, and stores. The first three are associations of producers, the last of consumers. Germany is the parent country of the co-operative bank, and the only country where this form of association has reached a marked success. Germany also led the way in agricultural co-operation, but has been rivaled by other countries. Denmark, Switzerland, the United Kingdom, France, Belgium and Italy have all developed promising movements in this field. The workers', or labor copartnership, societies, appeared almost simultaneously in France and England in 1848. Little has been accomplished in England, tho in France and Italy these associations are growing steadily stronger.

It is in store-keeping that the co-operative movement has made its greatest success, and England is at once the parent country and the land where the movement has reached its highest development. Mr. Fay writes: "Great Britain took the lead,"

¹ *Co-operation in Home and Abroad: A Description and Treatise by C. D. Fay.* New York: The Macmillan Co. \$3.00.

working class, which proceeded to organize itself as wage earners in a trade union and as wage spenders in a co-operative store."

The earlier co-operative movement in England reached its climax in 1833. Then came a temporary period of decline. The Rochdale Pioneers date from 1844. They are not the oldest of existing societies, and they did not invent the "dividend." But they were the first to put the "dividend" system on a firm and successful basis, and the growth of the modern movement is usually dated from their organization. The growth has been gradual, but it has been sure. In 1906 the United Kingdom could boast of 1,448 stores, with 2,222,417 members, a share capital of \$135,000,000, sales of \$315,000,000, and profits of approximately \$50,000,000. France has more stores than any European country, but fewer store members per head and less business per store member. The movement is particularly strong in Belgium, where it is more predominantly socialistic than in any other country. Italy in 1906 had the same number of stores as had England, but the movement there lacks organization and unity. The movement is growing rapidly in Germany and Switzerland, and is also making its beginnings in a number of other European countries.

In his conclusion, Mr. Fay attempts to define co-operation in its relation to Socialism on the one hand and competition on the other. Co-operation, he decides, "is not the negation of competition, nor does it affect competition in one way only. It is not the herald of Socialism, nor is it a means to combat it." That it is bound up with Socialism in some countries is true; but in other countries it is just as certainly detached from Socialism. The co-operative store admittedly conforms to the Socialist conception of industrial structure; "but it is illegitimate to deduce from this similarity of structure that the co-operative store must or ought to profess Socialism." The co-operative synthesis, he finds, centers about a common and original impulse of man, which inspires him to make his weakness strength by joining with others

of like condition for a promised end. This may or may not be Socialism, according to whether or not the aims are general and political as well as economical, or merely confined to immediate material needs.

The Russo-Japanese War and After

GENERAL KUROPATKIN'S book on the Russo-Japanese War was suppressed in Russia almost immediately after its appearance, for the Bourbons never learned anything and never forgot anything, and there is an equality before the press censorship under the despotism, corresponding to the equality before the law under a republic. The first three volumes of the original treated, respectively, of the three principal battles of the war—Liao-yang, the Sha-ho and Mukden; it is only the fourth volume, serving as a summary of the whole, that has appeared in an English translation.¹ We believe that the lay reader has lost nothing by this omission of the detailed account of military operations, the intricacies of which he cannot hope to comprehend. Even the translated portion bristles with puzzles for the average peaceable citizen. The main object of the author is twofold: First, to prove that as Minister of War he was opposed to any policy that might lead to a rupture with Japan; and secondly, to demonstrate that the Russian army was stronger, both materially and morally, at the conclusion of peace than at any time before or during the war, while the Japanese power was sensibly declining, and that the Russians were sure to win if their Government had shown the same persistence and determination as their commanders in the field. Thus General Kuropatkin contradicts Minister of War Kuropatkin. If the policy which led up to the war was chimerical and the war should never have been entered upon, it is clear that the sooner the war was concluded and the policy abandoned the better for the Russian people. But the chief value of the work lies in quite other directions. The most important

lesson it teaches, and one that the jingo-ists and fire-eaters of every nation might well take to heart, is the stress which this professional soldier, who is even now universally acknowledged a master of his art, lays on the *moral* side of war. A first-class war carried on under modern conditions must be a popular war, a war the objects of which are understood and approved of by the nation; a war, therefore, in which are at stake great national issues, for which the nation is willing to make the requisite great sacrifices. Another point of great interest, particularly to the student of Russian affairs, is the disclosure of the chance way in which the country was plunged into a great war at its most vulnerable extremity as the resultant of purposes and ambitions each pulling in a different direction—the commercial schemes of a Witte, the reckless greed of a Bezobrazov, the Asiatic arrogance of an Alexeiev, the far-sighted but timid resistance of a Kuropatkin—but all combining to bring about the catastrophe. The student of international relations, again, will find highly instructive the chapters dealing with Russia's position in relation to her numerous neighbors along the vast extent of her European and Asiatic frontiers. And finally the student of personality, of human character in dramatic development, will find of absorbing interest the revelation of the heroic personality of the author himself—the man who vainly tried to avert the war; who assumed the supreme command after the initial disasters, resolved to overcome the great odds arrayed against him by means of indomitable endurance and extreme tenacity; handicapped by orders from his worthless superior, Viceroy Alexeiev; thwarted by repeated acts of disobedience and incompetence on the part of such creatures of court influence as Generals Gripenberg and Kaulbars; holding on to every inch of ground, rising superior to every defeat, and ever presenting a menacing front; displaced by a subordinate, under whom he continues his herculean toil with the same end ever in view—the ultimate triumph of the Russian arms; finally baffled in his hopes, he retires into obscurity and writes down his memoirs for the instruction of his countrymen.

¹THE RUSSIAN ARMY AND THE JAPANESE WAR. BY General Kuropatkin. Translated by Captain A. B. Lindsay. Two volumes. New York: E. P. Dutton & Co. \$7.50 net.

only to see them suppressed by the autocratic censor. Did he but possess the spark of genius, were he more than a capable and conscientious state official, General Kuropatkin's fate would rise to the height of a great historic tragedy.

Mr. Thomas F. Millard's book² treats of so many matters and opens up so many problems that we are obliged to confine ourselves here to merely indicating its scope. About one-half of its space is given up to a discussion of the various methods, direct and indirect, by which Japan is trying to restrict European and American competition in Southern Manchuria and in Korea, and culminates in a plea to the United States Government to defend American commercial interests within the sphere of Japanese, as well as Russian, influence in the Far East. There follows an account of the reform movement in China, of the position of American trade there, and of the relations of China and the United States. In connection therewith there is a curious story, accounting for the deflection of the course of the American fleet from Shanghai, the great port at which it was originally intended that it should be entertained by the Chinese in order to celebrate in a striking way the friendship of the two nations, to the comparatively obscure port of Amoy, where the celebration lost all significance. Next comes an account of the American policy in the Philippines, the actions of the Philippine Assembly, and the economic condition of the islands. A study of the strategic position of the United States in the Pacific, particularly in relation to a war with Japan and the difficult task of the defense of the Philippines, concludes the volume. The author, it need hardly be stated, is heartily in favor of our holding the islands, for our own good as well as that of the Filipinos.

The Origin of the British Colonial System, 1578-1660. By George Louis Beer. New York: The Macmillan Company. Pp. viii, 438. \$3.00.

Like many another student and historian, Mr. Beer has been working backward. In 1907 he published a volume on

British colonial policy, in which he covered the eleven eventful years from 1754 to 1765—the years in which the American Revolution began to come to life. The present volume takes up the story at a much earlier date and comes down only to 1660. Other volumes will still be required to fill the gap between 1660 and the point at which Mr. Beer originally took up the story. As in his first installment, Mr. Beer in the present work makes out a good case for the English Government in regard to its dealings with the American colonies. He shows that the colonies were indebted to England not only for defense against foreign countries, but also for a large part of the cost of their government; and he also shows that if a sacrifice was demanded of them in the restriction of their over-sea trade to British ports, a sacrifice was also demanded of England in their favor when the growing of tobacco was prohibited in England and the crops of it destroyed, that there might be no competition with the colonial product. The method pursued by Mr. Beer in writing the present volume entails a very considerable amount of repetition. In regard to tobacco, which was long the staple product of Virginia, he devotes a chapter to the history of the trade, the restrictions on its growth and marketing, and the preferences granted to it in England. But in the succeeding chapters, on the English fiscal system and the colonies, the Stuart regulation of the tobacco industry, the restrictions on the colonial export trade, the exclusion of foreigners from the colonial trade, and the economic development of the colonies, he is obliged to tread the same ground again and again, until the repetition becomes a little wearisome. Still, altho this may detract somewhat from the readableness of Mr. Beer's present volume, it does not lessen its value as a contribution to the history of the British Empire. And it is to British rather than to American history that Mr. Beer's volume belongs. The Conservative party, which is pushing tariff reform and colonial preferences in England at the present time, is merely trying to resuscitate the colonial policy of the Stuarts, and in many respects it might seem as tho the party had borrowed its policy direct from the pages of Mr.

¹ *Manchu and Mongol Empire, 1644-1911*. By George Louis Beer. New York: Macmillan, 1907.

Beer's volumes. It might be well for Englishmen to remember that the earlier policy resulted in the loss to Great Britain of the American colonies.

The French Influence in English Literature from the Accession of Elizabeth to the Restoration. By Alfred Horatio Upham, Ph. D. New York: The Columbia University Press. \$2.00.

It can hardly be said that comparative literature has as yet done very much to recommend itself by the choice of inspiring or lively subjects. For these "investigators," as they like to call themselves, the difficulty or remoteness of the problem seems in most instances to constitute its sole merit. Provided only they have a puzzle they appear to be quite satisfied—all the better if it is unanswerable. While it may be doubted, too, whether the problems of which they are fondest—the tracing of obscure analogies, influences and borrowings from one language, often from one insignificant dialect, to another—are particularly useful, either, even when they are solvable. From these drawbacks Dr. Upham's book suffers unusually. To search out French influence in English at the time when the latter literature was under the ascendancy of Italian looks in itself like a singularly ungrateful sort of labor. Naturally under the circumstances the investigation reduces to a kind of literary rummaging—comparable only with hunting for needles in haystacks—and results in a comparison of petty resemblances and similarities which are, as often as not merely fanciful. The list of "parallels" at the end of the volume is a good example of the futility of the thing. As between Bacon and Montaigne, for instance, these so-called parallels exhibit almost no *literary* affinity; and what little there is is of the vaguest sort. They show in many cases a general likeness of idea, but then the idea is usually a moral commonplace and might be illustrated from a score or more of other moralists, too; while the form, the manner of presentation, the literary quality of the two sets of quotations is so diverse as to make their juxtaposition appear now and then well nigh fatuous. As a result of these char-

acteristics the whole discussion is thoroughly lifeless and unreal. It cannot be denied that Dr. Upham has manipulated his card catalog conscientiously, but even the elastic card catalog has its limitations.

Much Ado About Peter. By Jean Webster. New York: Doubleday, Page & Co. \$1.50.

Most of Peter's adventures have already been told in short-story form in some of the monthly periodicals. Peter is a coachman, employed on a well-to-do lawyer's estate. He is Irish, and has the "defects of his qualities." He is something more than an average coachman, and the incidents of his career are well worth telling. A philosopher in his way, his varied experiences have prompted him to certain well-defined views regarding the management both of employers and of sweethearts and wives. It is enough to say that the soundness of his views is usually confirmed by success when practical tests are made. Miss Webster's descriptions are good, her insight into human nature is keen, and her humor is infectious. It is an entertaining book for a leisurely afternoon.

The Making of Canada. By A. G. Bradley. New York: E. P. Dutton & Co. Pp. viii, 399. Two Maps. \$3.

The ground covered by Mr. Bradley in the first half of *The Making of Canada* is much the same as is covered by Mr. Justin H. Smith in his recently published "Struggle for the Fourteenth Colony." Mr. Smith approached the subject from the United States side of the boundary line. Mr. Bradley descends upon it from the Canadian side; and while the two writers agree on almost every question of fact, the different aspects in which the facts are presented and the different degrees of glory accruing in their pages to American and Canadian heroes respectively, form an amusing object lesson of the extent to which the writing of history is colored by sentiment, emotion and prejudice. Mr. Bradley considers Ethan Allen's triumphant entry into Ticonderoga as merely the treacherous betrayal of a handful of men leading a careless exist-

ence in an isolated fort, by a neighbor whom no one suspected of hostile design, and who held in the background a much superior force. Benedict Arnold's heroic march to Montreal is treated with more respect, but the position and good faith of the leader are belittled by the use of the phrase, "The notorious Arnold," at the outset—a phrase which is distinctly unfair, for no matter how discredited Arnold was in later years, he had at that time done nothing to warrant the use of an opprobrious adjective. Mr. Bradley follows the story from the Peace of 1763 to the end of the War of 1812-14. The earlier chapters travel over well-trodden paths, but the chapters covering the migration of the Tories from the United States at the end of the war and their settlement as united empire loyalists in Canada are a valuable contribution both to Canadian and United States history. The hardships endured by these Americans who had remained loyal to the British Crown, both from their neighbors and fellow countrymen before leaving their old homes, and on account of the rigorous climate of the unbroken wilderness into which they were transplanted, make it easy to understand the traditions of antagonism to the United States on the part of Canada which was evident as late as the War of 1812. That this antagonism should have permeated the whole of British Canada appears the more natural after a study of Mr. Bradley's figures, from which it seems that the loyalist immigrants exceeded in number the British settlers who had preceded them in all the Provinces except perhaps in what is now the Province of Ontario. While the presentation of the events of the later war shows the same bias as is evident in the earlier part of the history, Mr. Bradley's book is one which it would be well for Americans to read, if only for the sake of gaining a glimpse of our own history as it appears to observers to the northward of us. It is to be regretted that Mr. Bradley has not taken the trouble, in passing his sheets thru the press, to correct any grammatical errors and even more numerous examples of awkward constructions of sentences which mar greatly the quality of his book.

The Cambridge Modern History, Vol. XI, The Growth of Nationalities. New York: The Macmillan Company. \$4 net

The eleventh volume of *The Cambridge Modern History*, bearing the sub-title of "The Growth of Nationalities," does not differ from the previous volumes in arrangement and method. The political development of all the countries of the world during the period from 1840 to 1871 is covered by a series of monographs by eminent specialists, including Emil Bourgeois, of Paris; Meinecke, of Freiburg; Masi, of Florence; Ward, of Cambridge; Oechsli, of Zurich; the late Sir Spencer Walpole; Roloff, of Berlin; J. Fitzmaurice-Kelley, E. Gosse, A. R. Colquhoun and Sir E. M. Satow. In accordance with the traditions of history writing in vogue in England, everything is subordinated to the political record, but a few scant pages on the literatures of the various European countries are added in what appears to be a half-hearted fashion, as if to warn the reader that the editors were not wholly oblivious to other than political elements in human nature. Our authors call this period, from the point of view of universal history, the most important since the Congress of Vienna—measured by changes in the map, the development of nationality and the growth of self-government. This is the theme of the volume before us, and its three aspects are treated with the fullness of detail and businesslike accuracy which characterize the Cambridge school. It is, in short, thoroly pragmatic, not in the philosophical, but in the ordinary sense, so that scarcely a gleam of tendency illuminates the record. The volume, like all the others in the series, is indispensable to every student of modern history, and we ought to be thankful from the bottom of our hearts that the editors, breaking away from the futile and pedantic notion that we can know more about the middle ages than our own time, have given us a work that connects us with the morning newspaper. The usual bibliographical apparatus, devoid of any critical notes or indications of the relative importance of books, is given as an appendix. We cannot do without this work, but we cannot read it in the summer time with breathless interest.

Literary Notes

....The well-known series popularizing the results of modern theological and religious criticism called *Religionsgeschichtliche Volksbücher* is proving so acceptable that the total editions now are more than three hundred thousand and the latest number in the set, "Christus, Die Anfänge des Dogmas," by Prof. Johannes Weiss, of the University of Heidelberg, appears in its first edition in ten thousand copies. Facts like these show that thinking people are intensely interested in the leading problem of religious debate.

....*Working Lads' Clubs*. By C. E. Russell and Lilian M. Rigby. New York: The Macmillan Co. \$1.50. The book is a comprehensive description of the practical working of boys' clubs in England. Its value to American readers is much less than to English, inasmuch as our conditions and our situation are not parallel. Nevertheless, there is a universal element in the discussions thruout the volume which makes it possible for those interested in juvenile reform and development to gather many a suggestive hint. Some of the subjects discussed are: "Types of boys," "discipline," "outdoor games," "indoor sports," "camps," "gymnasia," "the club and the home," "the boy and the girl," "theaters, music halls and dancing."

....The dedication of Chicago's lake front to park purposes to the exclusion of harbor accommodations that may be required for the city's growing commercial navigation, led last year to the appointment of the Chicago Harbor Commission, whose *Report* was published a few months ago. The resolution creating the commission authorized it, not only to investigate the question of the reservation of part of the lake front for possible future harbor uses, but also to study Chicago's harbors and their relation to railway terminal and park plans. The *Report* recommends the establishment of a harbor department, and lays stress upon the plans prepared by the Commercial Club of Chicago for the combination of harbor developments with the beautification of the shore front. The *Report* is intended to be, and is, a basis for future consideration of the problem, containing a vast amount of well-arranged data.

....Canon and Mrs. Barnett, who are justly famous for their long service as leaders at Toynbee Hall, in East London, advocate, in their recent collection of essays, "actions which lie in the way towards social reform." They appear neither as Individualists nor as Socialists, "both of whom are apt to forget that the far-off prospect is always more or less an illusion, something which has in it a truth, but a truth which is never realized in its detail." "The pity of it is that, taking as literal fact the illusion of Socialism, both often refuse to do what is possible and practicable." The essays are more valuable as revelations of British social conditions than as guides to progress in America. So different are the diseases of the two lands that the same recipe cannot be adminis-

tered to both. But the devotion, the ability and the training of these social doctors are worth imitation. (*Towards Social Reform*, Macmillan. \$1.50.)

....Mr. Chase S. Osborn, of the Board of Regents of the University of Michigan, devotes two readable volumes to *The Andean Land*—the ten republics of South America and the three Guianas, with visits to the Falkland Islands and Juan Fernandez. Mr. Osborn would have us travel in South America in preference to Europe or Asia, and his book is well calculated to induce us to do so. He pays attention, by the way, to matters of industry and commerce, but one doubts if he takes the right step for the encouragement of our trade with South America when he declares that the "cheap 'made in Germany' imitations will do us good in time by the reaction which will surely follow, and is already setting in." Our export trade needs more energetic measures than passive waiting for this to happen. Nor was it, perhaps, quite judicious, or of benefit to closer relations, to inform a South American woman that "all Americans in South America permanently have something the matter with either their character or their judgment." (A. C. McClurg & Co., 2 vols., 8vo., \$5.)

Pebbles

The best prohibition story of the season comes from Kansas where, it is said, a local candidate stored a lot of printed prohibition literature in his barn, but accidentally left the door open and a herd of milch cows came in and ate all the pamphlets. As a result every cow in the herd went dry.—*Adrian Times*.

BIG RAPIDS, Mich., June 17.—Over at Newaygo, where it is so dry that the "boys" habitually "spit cotton," there seem to be some mighty dry prohibitionists, according to a story that comes from the desert.

A Newaygo citizen recently received a letter from a Kentucky whisky house, requesting him to send them the names of a dozen or more persons who would like to get some fine whisky shipped to them at a very low price. The letter wound up by saying:

"We will give you a commission on all the orders sent in by parties whose names you send us."

The Newaygo man belonged to a practical joke class, and filled in the names of some of his prohibition friends on the blank spaces left for that purpose.

He had forgotten all about his supposed practical joke when Monday he received another letter from the same house. He supposed it was a request for more names, and was just about to throw the communication in the waste basket when it occurred to him to send the name of another old friend to the whisky house. He accordingly tore open the envelope, and came near collapsing when he found a check for \$4.80, representing his commission on the sale of whisky to the parties whose names he had sent in about three weeks before.—*Detroit Free Press*.

The Independent

Published at New York Post Office, as Second Class Matter.
Publication Office, W. B. Root,
110 Fulton Street, New York.

A WEEKLY MAGAZINE FOUNDED IN 1848.
One Year, \$2 00. Single Copies, 10 Cents.

Single copies over six months for 25 cents. There are to any foreign country, by the Express and Parcel Post, \$1 75 a year, and by the same, \$1 00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be quoted as low as offered by any responsible agent.

Orders for the change of our address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on request of books and files, are best reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us in good condition, with \$1 50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Does Prohibition Prohibit?

OF course it does not of itself. If not enforced it is permission, not prohibition. It was in the early days of the Maine law that the Down East statesman uttered the famous saying, that he was "in favor of the law, but agin its execution." It is no real prohibition when a parent forbids his child to do a thing and then lets him do it as much as he pleases.

We wish we could have printed five times as many letters received in response to our question of experience and observation. Every answer is of interest and value. Particularly we value those letters which tell us of the failures of prohibition, for they suggest not so much the unwisdom of the law as the impotence of the efforts to give it force. Our readers will particularly observe the different views which the advocates and opponents of prohibition take of the same conditions. This is true of such cities as Milwaukee and Kansas City. We anticipate that there are readers of ours in North Dakota who will be astonished and shocked that others find drunkenness so rampant and the law so ill enforced there.

What impresses us first from a reading of the whole correspondence is the fact that enforcement must, on the whole, be fairly successful, as proved by the opposition to prohibition and local option by the brewers and distillers. They know their business. They would not spend tens of thousands of dollars to fight the laws if their business were not in serious danger. It is of no use to tell us that there is as much drunkenness as ever, as much liquor drunk, when the manufacturers of alcoholic liquors are banded against the prohibitory laws. We admit the fact that wholesale liquor houses in Kansas City, Mo., are doing an immense express business in bottled goods into Kansas. Granted, but these total consignments are small compared with the amount that would be freely sold and swallowed otherwise. To get the liquor is now made a bother; children do not see saloons on their way to school, and youths are not tempted by the easy access to bars. The old toppers will have their drink; and, as with legislation in China against the opium habit, the old sots will not be cured and will have to die off. They are hastening the process.

Accordingly, we are not as much concerned as some over the decision of the United States Supreme Court that a State cannot interfere with the freedom of interstate commerce in liquors. It is hard, to be sure, on a prohibition State that it cannot exclude liquors sent from another State, as it can forbid the commerce within its own limits. Yet the main power continues within the authority of the State. A merchant in a "wet" State can freely send his barrels and kegs across the line of a "dry" State; but the Legislature of the latter State can forbid it to be sold and can destroy it if offered for sale. What it cannot do is to enter the house of a private citizen who has received a package by express and confiscate it. The man may invite his tippling friends and give it to them, but he cannot sell it to them. They can organize a club and buy it, but a club can be controlled by State or city enactments. If the law is outwitted by clubs it is the fault of the city or State, which does not care to enforce it. But these old, soaked toppers are not our concern.

It is the yet untainted that we would protect.

One serious question is raised by several writers, namely, that the exclusion of bulky light liquors, particularly of beer, tends to increase the use of whisky and other concentrated liquors, which can better be sent by express or carried secretly in a bottle. We presume this is a fact. It is an evil, but there is no major good that has not some minor evil ancillary to it. It is not so bad that men who are soaked in beer should get whisky with some difficulty as it is that youth not yet infected should be constantly invited to contract a bad habit. Once more, it is not the habitues of the saloon whom we are concerned about.

There is just one other objection to prohibitory legislation which one writer has pressed, and which may deserve a word of attention. It is that which declares it an impertinence to meddle with a man's liberty to eat and drink what he pleases. That sounds well, but is all sound—or shall we say unsound? If the public believe that any kind of food or drink, or any kind of amusement or business, is injurious to the community on the whole, it has the police right to interdict it, no matter at what interference with the rights of personal liberty. A multitude of people would like to eat unsound fruit or bad meat, but the inspectors will destroy it. A man's liberty will not allow him, much as he wants to, to engage in or attend a prize fight or a cocking main; and those who patronize such pleasures regard the interference with their liberty as a great tyranny. Probably few of those who bet their money on a horse race are thereby made embezzlers, but the law still forbids gambling. It does not disturb us that, in a prohibition district, it is made difficult for a man to use his liberty to get drink or to get drunk. It is for the advantage of the community that he should endure this enforced self-denial.

By local option and State law the area of prohibition is rapidly spreading. The saloon business is being made more disreputable, and the brewers and distillers less admired members of society. They know they are in a risky sort of business, like the manufacture of explosives.

If they suffer from hostile legislation they have no right to complain; they know the nature of their business, and no public spirit or private generosity on their part can purchase them the privilege to do a public injury and a multitude of private wrongs.

✱

Mr. Taft's Interest in the Tariff

WRITING on the 12th, before the President had begun to tell the members of the tariff conference committee what kind of a bill he would be willing to sign, we said:

"There is a perceptible sentiment on the Republican side of the House in favor of all the revision downward that the House bill permits. Representatives are not far from the people, and many of these men have heard from their constituents. Mr. Taft would like, of course, to have laid before him a bill that he can sign without breaking any promises. It seems to us that it would be well for the House Republicans to be assured in some way that he still prefers revision downward, or at least is opposed to revision upward. The President knows that if he should sign such a bill as the Republican conferees desire to make, he would inevitably suffer in public estimation. He knows also that his party would be affected injuriously, altho in the absence of a strong and consistent Democratic party the injury would not be mortal. For his own sake and for the good of his party, as well as in the interest of the people, he should strive in all honorable and permitted ways to improve the projected revision. At this late day, however, but little improvement can be made even by the exertion of his powerful influence."

He has since spoken quite plainly to members of the committee and others, insisting upon the retention of the House provisions concerning hides, iron ore, oil and bituminous coal. Some have openly opposed him, but a majority in the House will probably vote for his policy if it can be laid before them for action. Mr. Aldrich, pointing to the bargains by which he obtained the assistance that enabled him to overcome the insurgents and to add many unwarrantable increases to the bill—such as those affecting cotton goods, and those introduced surreptitiously at the last moment for the benefit of a highly successful lace factory situated near his home in Rhode Island—says that the President must find the votes that are required for the changes he desires. And it is

understood that Mr. Taft is now looking for those votes, expecting that he will get them.

But this movement relates, so far as the public can learn, only to free hides, petroleum, iron ore and bituminous coal. If these products should be put on the free list, the effect upon the tariff as a whole would be scarcely perceptible. If the great schedules covering cotton goods, wool and woollens, metals, farm products, fruit, etc., should remain as they are in either the House bill or the Senate bill, the promises of which Mr. Taft speaks would be broken. And it is no longer possible, under the rules which ordinarily govern conference procedure, to disturb a large majority of the duties. A great many of these either are identical with the Dingley rates, which, as Mr. Taft said some months ago, "have become generally excessive," or rise above those rates, even if the effect of the new basis of valuation and of the maximum addition of 25 per cent. be not taken into account. They do not represent that "substantial revision downward" for which he found a pledge in the Republican platform.

Free ore would slightly assist certain steel manufacturers whose plants are on or near the Atlantic Coast. It is by no means clear that free petroleum would not aid the Trust and perhaps ruin independent producers of crude oil. Free bituminous coal would help the highly protected manufacturers of New England, promoting the importation of their fuel from Nova Scotia. Free hides would serve the interests of manufacturers in various branches of the leather and shoe industries. But these additions to the free list would have scarcely any effect upon the cost of living, which has increased 30 or 40 per cent. since the Dingley tariff was enacted. And justice would demand proportionate decreases of the duties upon those finished products the cost of making which would be slightly reduced by these changes. But those duties, or a majority of them, are beyond the reach of the conference committee, under the rules which ordinarily limit the action of such a body.

When the duties affecting the clothing of the people—to take one schedule for an example—were undergoing "re-

vision," the revisers might have been restrained if they had been directly informed that the President, as he said in his statement last week, was "committed to the principle of a downward revision" and "felt strongly the call of the country" for such a revision. A committee representing all the great wholesale drygoods merchants of the country has recently shown him that the pending revision increases by additions of from 48 $\frac{3}{8}$ to 93 $\frac{3}{4}$ per cent. the duties on the plain cotton cloth used by women and children. Increases surreptitiously introduced by Mr. Aldrich almost at the end of the tariff debate add much to the rates on cheap lace and embroideries, affecting imports of nearly \$50,000,000 for the benefit of two or three factories, notably one in Pawtucket, R. I., altho the owners of the chief American competitor of this factory had declared that the industry was "already over-protected." We can speak of only one or two examples of the additions which the committee would like to approve. The two bills contain many others equally indefensible, and many which a conference committee, as we understand the rules, cannot touch. They were repeatedly exposed by the Republican insurgents, who had no encouragement from the President.

In such efforts as he may now make to procure a "substantial revision downward," he will have the hearty support of a vast majority of the American people, but we fear that he has taken up the work at too late a day. His own statement indicates, moreover, that the list of reductions upon which he insists is a very short one, which would give little or no relief to the ultimate consumer.

Cruelty of Immigration Rules

WE have lately had fresh illustrations of the inhospitality, and even utter cruelty, of the rules laid down by law or by official construction and imposed on intending immigrants. Our treatment of Chinese and Japanese immigrants has been characterized by monumental folly and injustice; and we do not seem to have in Congress those who, like the late Senator Hoar, condemn it thru and thru. The best they seem able to do is to

favor a rule of mutual equality, which will exclude from China American laborers who do not wish to go there, and from the United States Chinese laborers who do wish to come here. This is under the ancient rule, "Heads I win; tails you lose."

It is against white people that the fresh exclusion is directed. One shocking case, which may possibly be regarded as exceptional and due to the stupidity of an over-strict constructionist of law, has lately attracted attention. A young man five miles over the Canadian line had his skull broken in a game, and they telephoned to Buffalo to have the unconscious man met by an ambulance and receive surgical treatment at the hospital. When the boat reached American soil the immigration officer refused to allow him to land because he was a Canadian, a disabled Canadian, liable to be a burden to the country. The physician who came with him argued and protested that this man was not an immigrant intending to settle, but a patient for the hospital who would go back to his home, but the officer was obdurate. If the man was not treated in a few hours he would die, and they were obliged to improvise a surgical ward on the boat in order to save his life. It may be that the law could be so interpreted by a Dogberry, but we need no law that would allow such cruel interpretation.

We have had another even more serious illustration of the barbarism of the system, for it is not the exceptional cruelty of a too stringent official, but the rule and policy which has returned of late hundreds of immigrants to their old home, if they are able to reach it from the port to which they are sent back. The rule is, that each immigrant on landing must have twenty-five dollars, as an assurance that he will not immediately become a public charge. This rule applies to laborers who have no special artisan trade. Under this rule women have been deported at very short notice, and in several cases persons who were not allowed time to communicate with friends who would have provided the required money and cared for them.

Such a law, or interpretation of law, is most inhospitable. The reason for it

is a hypocritical pretense. The fear is offered that they may become paupers. But these are not diseased, nor are they idiots. They are healthy, strong men and women, whose life and service are offered and are of money value to the country. Every healthy immigrant, man, woman or child, enriches us, adds to our productive power. But that is the very reason why they are not wanted. It is feared that they will compete with those, native-born or immigrant, who are already with us and who have the first right to the jobs. We can no longer afford, they tell us, to be the asylum for the world's oppressed humanity, but must care for our own. We do not hold this doctrine. We believe there is here room for all, and generally work of some sort for all. Further, we believe in that human solidarity whose affection embraces our brothers of every race and land, and is glad to share our blessings with those who are less fortunate than we. The rule which requires so large a sum is unwise economically and wrong morally. Exclusion is narrow and selfish. Our voice may be that of one crying in the wilderness, and heard only by those who come out to hear, but we stand by the eternal equal rights of man, even tho Italians or Slavs.

Persia and the Powers

THE most interesting feature of the Persian revolution to us of the Far West is the relation it bears to the international movements on which the fate of that country really depends. For Persia is merely the chessboard on which England and Russia are playing their game; the metaphor is literal, since from Shah we derive our word "chess." When the Anglo-Russian agreement was concluded by which this country was petitioned off into two spheres of influence, with a neutral strip between, the northern for Russia and the southern for Great Britain, everybody knew that, properly interpreted, it meant that the kingdom had been taken from the Shah and divided between them. But it was hardly anticipated that the prophecy would so speedily be fulfilled; that in less than two years British troops would garrison

Persian towns on the Gulf and Russian troops garrison Persian towns on the Sea, and a joint force of Cossacks and Sepoys in the capital defend the person of the Shah against a well-merited punishment by the people whose constitution he had overthrown by violence.

Yet we can all remember the time when, at a less portentous advance of Russia into central Asia, the cry of "the Russians at the gates of Herat" threw England into a state of as much excitement and animosity, altho less of trepidation, as now prevails there on account of Germany. The attitude of England at the present time is a peculiarly embarrassing one for the party which now has control of the government. Justin McCarthy in his "History of Our Own Times" makes the characteristic remark that the Liberals have always been opposed to coercion when out of power. But now they are in power, they are hindered in the free exercise of their principles by exigencies of the situation and the obligations of international agreements. Thus it happens that Great Britain is standing by France in her "peaceful penetration" of Morocco, which does not turn out to be so peaceful or so penetrating as was anticipated; that she is assisting in holding the Cretans under the sway of the Sultan and is unmoved by a massacre of Christians by the Turks as frightful as that which once brought her to armed interference; that she is allied with Japan in the subjugation of Korea; that she prevents China from prohibiting opium and from building her own railroads thru her own territory; that she is suppressing native newspapers and deporting Indian lawyers by the same "administrative process" for which she used to denounce the Czar; and that in Persia she is actively engaged with Russia in trying to check a popular movement to re-establish a constitutional form of government. We do not say that the policy of Great Britain is altogether unjustifiable in these cases. We merely remark that it is interesting to watch how a Liberal minister justifies them to a Liberal parliament.

Ostensibly the Anglo-Russian agreement of 1907 dealt only with the com-

mercial interests of the two countries and the protection of their people in Persia. In how far the Shah now deposed was concerned in the agreement is not known to the public. But the Minister of Foreign Affairs, Mushir-ul-Mulk, the same who is now called by the victorious revolutionists to serve as regent during the minority of the new Shah, issued at that time a note to all the Powers stating that the agreement concerned only Russia and Great Britain, and that Persia retained her independence of action and would maintain the open door.

The commander of the Russian force now at Kazvin, 86 miles from Teheran, is under instructions, according to a note issued to the Powers by the Russian Government on July 3, to abstain "from any interference in the political struggle raging in Persia and generally in the internal affairs of Persia." Russia and Great Britain kept strictly to the policy of non-interference in domestic affairs a year ago last June, when the Shah dissolved Parliament with "a whiff of grapeshot," but as soon as the constitutional party began to gain ground they abandoned their neutrality and took a very active part. When the Bakhtiari tribesmen (with whom we somehow seem better acquainted when we call them by their ancient name of Bactrians) reached Ispahan, which is on the southern boundary of the Russian "sphere of influence," they were met by the Russian and British consuls, who informed their leader, Sardar Asad, that the Shah, at the advice of Russia and Great Britain, had agreed to convene a parliament, and that their march northward must be stopped or it would necessitate foreign interference. To which Sardar Asad made reply that a ruler who had broken his promise once would do it again; that he was going to Teheran to see that he kept it, and as for foreign interference, that was just what he proposed to prevent. Then he went on to Teheran.

From the west came another constitutionalist force under the Sipahdar bound for the capital on the same errand. He was met twenty-five miles out by the representatives of the two Powers, who

also told him he must stop. He agreed to do this provided that the present cabinet be dismissed and new ministers selected by the constitutionalists, appointed instead; that the Shah's irregulars be disbanded and the troops placed under the control of the Minister of War, and that all Russian troops be withdrawn from Persian territory. The legations replied that these demands were so unreasonable that they did not think it worth while to lay them before the Shah. Whereupon the Sipahdar said he would postpone further discussion of the matter with them until he got to Teheran. And he went on.

Then it was decided to stop by force the two constitutionalist bands, which by this time had become one. It must be borne in mind that the only defenders of the Shah were General Liakhoff and his 800 Cossacks, the same Russian officer who at the command of the Shah a year ago bombarded the parliament house and slaughtered the representatives of the people. The status of Liakhoff and the eleven Russian officers under him is peculiar, tho very similar to that of the British gunners on the Confederate cruiser "Alabama," who were receiving their pay from the British Government while they were fighting us under the British flag.

But while Liakhoff was guarding one road the constitutionalists came into Teheran by another. The Shah was taken by British soldiers to the Russian Legation, where he is now sheltered under the two flags. He was declared excommunicated and deposed by the Mohammedan priesthood. The charge against him was perjury and there was no doubt of his guilt. Four times had he sworn on the Koran to support the constitution, yet he declared on November 22 that

"having recognized that the establishment of a parliament would conflict with the laws of Islam, we determine that in the future under no pretext shall such a parliament be established."

But this conscientious scruple he consented to violate on May 9 when he called another parliament at the instigation of the Russian and British Governments, which, however, we are given to understand, are not interfering in any way with the internal politics of Persia.

Corn Trains

THAT the New York Central should put on special trains at the service of the State Agricultural College, and to advance agricultural knowledge is not so novel as it is natural and inevitable. It does not express a sympathetic freak of one social force for another, but a very deep principle of coordination which is growing up between all the industrial forces. There is no champion of agriculture who better understands the field resources of this country than J. J. Hill, of the Northwestern. Such men comprehend not simply the dependence of the railroads upon agricultural prosperity, but the very close relation there is between the railroad and the plow in the unfolding of American industrial life. There is a sympathy of industrialism that is going to bring into harmonious action the social forces, as law, either permissive or mandatory, cannot.

We do not remember whether these corn trains began in Iowa or Illinois, but they are now found from Georgia to Wisconsin, and are everywhere received with enthusiasm by the farmers. It is a form of university extension little dreamed of when that term first came into force. The Oxford professor shouldered a bag of laboratory implements, or took them on a wheelbarrow, and gave his lecture to a rustic audience, none too large; the corn train thunders from town to town, and at every station finds a vast collegiate collection of learners, ready to listen to any one of the half dozen professors who will bring their scientific knowledge down to date. The matter has gone so far that we can easily imagine this form of instruction covering the whole country for six months in the year. According to Secretary Wilson the results are already startling. The corn yield is creeping up steadily, and soon we shall not be satisfied with anything less than an average of eighty bushels to the acre. This can be done when soil-making is understood. The United States will then talk about its five or six billion crop, instead of its two billion bushels of corn, while wheat creeps up to an average of fifty bushels to the acre, and cotton doubles its productive capacity. Our population may

then advance as fast as it pleases, and we shall be able both to clothe and to feed three hundred millions of people—this by the end of the twentieth century.

The greatest revolutions come with the least noise. The battle with selfish phases of social life, that is with the disintegrating forces, makes noise enough to compensate. Mr. Roosevelt was necessarily engaged very largely on this side of the question, the sum of the struggle being to clear the field of cumberers, and open the way for a more wholesome evolution. We shall, however, remember Mr. Roosevelt in the long run of history mainly because he was in such keen sympathy with industrial progress, and rallied the people to the preservation of their natural resources. Really the great revolution that has been going on is that which is expressed, not in the incarceration of criminals, but in the production of new foods, in larger quantities to the acre. Doubling the yield of important cereals inside seventeen years is what our economic plant-breeders already boast.

That we are at the same time breeding a new kind of citizenship and developing a new statesmanship is equally important. The winning citizen of the near future will be the man who has been trained with a close correlation between his hands and his brains. The winning statesman of the near future will be neither the classical Seward, quoting with equal facility from Homer or the Prophets, nor will it be the supervital and somewhat tempestuous Roosevelt, but the man who has been brought into the keenest sympathy with the productive forces of Nature, and whose senses are trained to see well and hear well, while his mind operates quickly in the application of facts to great truths. Meanwhile the apparent clash of capital and labor will have past away. Toil will be brought into correlation with money, and will be organized, not for strikes so much as to exalt the nobility of labor and the glory of achievement. Another ten years and we shall be well organized as a people on the new basis.

That all these changes should culminate in international industrialism was natural. The Agricultural Institute at Rome gives to that ancient city a pro-

spective glory greater than that which came from the imperialism of the Cæsars or the hierarchy of the Popes. In this country the coordination of the whole industrial movement lies naturally at Washington, and in the Agricultural Department. There, by an inexorable necessity, it finds its unity. The whole tendency is to create a new American character and a new American economy. Instead of a century of waste, like that behind us, we are being prepared for a century of constructive economy ahead of us. Mr. Burbank fairly stands as representative of the new man, and Secretary Wilson stands as representative of the new statesman. We are learning to create; have gone over to the God-side—as the earlier folk conceived God, that is, as a maker.

Some of the deep, underlying phases of progress have been, first, the turning of the tide of population countryward. Exactly where the little rills began to run we cannot say, but we do know that twenty years ago the flux of the population was cityward, and congestion was enormously on the increase. We know that today two-thirds of the increase of population moves out into the green fields. We cannot overestimate this social change, either in its effect on individual character or on all the problems of social life. Another astounding revolution has been the change from destructiveness to economic conservation. Up to twenty-five years ago all the legislation of our land went toward the giving away of public lands, the sacrifice of our forests and coal mines, and in every way a wasteful handling of national resources. To preserve our forests and our coal and our water power is now the nation's first thought. Even greater has been the revolution in educational effort. This movement is gathering force every day and is rapidly placing our educational institutions into sympathy with industrial life. Mere erudition no longer holds its place in popular esteem.

The American people will not hereafter mean a concrete mass, made out of all nations, and knowing only freedom; it will mean a well-ordered nation, working out its industrial purpose according to the latest scientific principles, in greater and in least affairs. It will mean a

people conscientious in its *work*. Industrialism means nothing less than a new American; a man who will not talk of entering into Canaan to despoil it, but who can and who will make the wilderness blossom as the rose, but will not exhaust its fertility for the future. That we see a very deep and vital change being wrought in our people we are glad to avow.

The Sixteenth Amendment

It is not to be woman's suffrage, altho such a proposed amendment has been much bruited; but it never had any chance of adoption. This amendment authorizing the United States Government to impose an income tax is a really serious thing and may well be expected. It is amazing that it passed the Senate unanimously and the House almost unanimously. That sends it to the States for ratification with the most hopeful promise of success. We have talked much of the practical impossibility of amending the Constitution, but when Mr. Taft recommends it the way seems easy. The Democrats have the right to boast that this is their thunder, and to twit the Republicans for stealing a plank from the Democratic platform of 1908. But that is the way of parties. When one party makes the attempt at a reform and fails, the other party is pretty sure to gather all the fruit worth while that has dropped to the ground. Probably every Democratic and every Western State, unless it be California, will ratify the amendment, but we are not so sure of some of the Eastern manufacturing States, within the bounds of which are the incomes that would be heaviest taxed. Nevertheless, a tax on incomes is the fairest of all taxes, and is depended upon by European nations. With an income tax we should not need the special corporation tax, except to put corporations under supervision.

A Campaign of Health

Dr. Walter Wyman, Surgeon-General of Public Health, in a recent interview, assures us that under present conditions our country cannot be again swept by a contagious disease. The bubonic plague was stopped at San Francisco, and the yellow fever has several times reached port without securing a

landing. Our fight just now is with flies, mosquitoes and rats, the purveyors of the most serious plagues. All forms of malarial poison are carried from person to person by the anopheles. Flies carry typhoid fever to our food. The bacilli are in this way distributed; and not, as we have been supposing, thru the drinking of infected water alone. Rats brought bubonic plague out of China and spread it over fifty widely scattered countries. This brings directness of aim with our future battle of epidemics. Our lines of defense surround the country, like a defensive army, with General Wyman as commander-in-chief. He has under command 1,740 men, with 450 doctors on his staff. Vessels bringing immigrants from infected countries must not only show clean bills of health, but there are special inspectors set to watch over fruit vessels. These men are established at Porto Rico, Hawaii and the Philippines. It had become unsafe to purchase a bunch of bananas or a pineapple. This is a thoroly peace organization, and it points the way toward a reorganization of national economics, leaving out the military.

Preservation and Domestication

Our Agricultural Department at Washington has issued a request that the States be enabled to second its efforts at plant breeding. Dr. Fairchild, who is agricultural explorer-in-chief, calls for a permanent arboretum of wild plants in connection with every Experiment Station in the United States. One station could have a collection of all the wild species of a specific fruit, co-operating with another having a similar collection of some other plant. The Federal Government has now an office of foreign seed and plant introduction, and could co-operate with the State Experimental Stations. This would organize the whole country in a movement for the steady improvement of trees, plants, fruits and grasses. He suggests that the city park associations might be well associated in this movement, giving places for the testing of new plants. It will not be difficult also to secure the co-operation of many private estates. The maintenance of animal collections will be more difficult and

expensive, and yet it is exceedingly important. Many animals capable of domestication, or at least crossing with domesticated types, are disappearing. The loss may be beyond estimate. The Bureau of Animal Industry is now crossing the mountain zebras with the ordinary horse, at their station near Washington. Dr. Fairchild feels sure that among the races of Indian cattle and the large horned sheep of Sardinia we could find very valuable animals for cross-breeding. Unless some systematic effort is made, it is sure that many valuable forms of both animals and plants will pass out of our reach. "Considering the conservation of our national resources, the preservation of reproducible forms of life from absolute extinction is one of the most important issues." Our Agricultural Department is leading the way to the solution of some very serious problems ahead, in the way of feeding our rapidly increasing population. The preservation of a plant or animal species from extinction will place future generations in the possession of material from which vast orchards, great forests or forage areas can be created; or new races of cultivated animals adapted to conditions where our present races of animals cannot survive.

A Forty-Foot Culture Shelf

We consider one of our most valued possessions the complete bound file of THE INDEPENDENT, running from 1848 to the present date. It occupies over forty feet on our bookshelves, and makes a complete and graphic history of the world for the last sixty years. In the older volumes the size of THE INDEPENDENT is larger than the newspapers of today, and half-page illustrations and cartoons frequently adorn the first page. We have almost a complete duplicate file, consisting of thirty volumes published before 1883. For fear of the possible destruction of both files by fire we should be glad to place the duplicates in some fireproof building where they would also be accessible to the public. If there is any library or society that would care to secure the duplicate file for a nominal sum, we should be glad to hear from it.

Reading Makes a Full Man

The most valuable point in Mr. Gorst's article on "The Danger of Books," in our opinion, is the revelation of the methods of modern journalists. We had long suspected, from some manuscripts that come to our hands, and still more from what we read in rival magazines, that it was their custom to evolve their articles from their inner consciousness without reference to facts or ready-made opinions, and we are glad to have our suspicions confirmed by this distinguished British representative of the craft. Facts are apt to interfere with the *a priori* theories which are so pleasantly spun from the brain in moments of repose, and many a readable article has been spoiled through the discovery by the author, or by the editor to whom he submitted his work, that it was contrary to the ready-made opinions of those who knew something about the subject. But Mr. Gorst is only putting in an emphatic way the well-known tho too little heeded truth that reading should not take the place of thinking. There is undeniably a vice of literary gluttony leading to divers diseases, such as paralysis of the will, numbing of the intellect and excessive timidity, but it is not so common yet as to make our Carnegie libraries a menace to the community. Mr. Gorst asks:

"Is it more noble to quote Herbert Spencer or Emerson than to quote yourself? Is it more useful?"

That depends on one's valuation of himself, whether he says "*Ego et rex*" or not. The value of an opinion depends solely on its correctness, not on who said it. Mr. Gorst's ideas are therefore just as valuable to the world as Spencer's or Emerson's in so far as they are equally correct. Of that, of course, the reader is the judge.

An Ideal Appointment

We should have regretted the removal of Ambassador Rockhill from Peking but for the fact of his transfer to St. Petersburg. We feared no man could be found adequately to fill Mr. Rockhill's place, but President Taft has found such a man in Charles E. Crane, a Chicago manufacturer who has long been interested in the Oriental commerce, and has

visited China and Russia many times and talks the Russian, and, for aught we know, the Chinese, language. His uncle was the famous Chinese missionary, lexicographer and diplomatist, Dr. S. Wells Williams, author of "The Middle Kingdom." It is evident that the President has not sought to make this appointment pay a political debt, for Mr. Crane has, until the last Presidential election, consistently voted a Democratic ticket. It ought not to be asked, in choosing our representatives abroad, whether in the diplomatic or consular service, what their politics are, and they ought to be continued in office with any change of parties at home. President Taft is particularly interested in the development of American enterprises, whether commercial or educational, in the East, and will give Mr. Crane his warmest support; and on his side Mr. Crane would have accepted no other position in the gift of the nation abroad. The appointment is ideally good, and will be welcomed in China by those who wish to maintain the open door for trade, or to maintain American interests in railroad development, or those who are seeking thru Western schools to develop China herself. It is of the utmost importance to us that we make China feel that America is her friend and helper in her rehabilitation.

International Discourtesy

One of the best self-advertisers is the English playwright, Bernard Shaw. He delights to say something to be quoted that will shock or amuse the British public. His last effort is in a letter to *The Saturday Review*, in which he utters his malediction on the expected visit to London of the Russian Czar and says that in view of "the abominable tyranny of which the Czar is the representative" he wishes *The Saturday Review* would charter a canal barge, decorate it with union jacks, surmounted by caps of liberty and black flags, in mourning for the Czar's victims, and "place it well in evidence in the Solent on the day of our national disgrace." But it is not true that the Czar goes to London as the representative of tyranny, no matter how unsatisfactory a ruler he may be. He comes as the lawful ruler of a great friendly sister nation. To be sure he is at the head of an undeveloped and imperfect

system of government; but it is the best that Russia has yet been able to evolve and it is unjust to put all responsibility of it on him. The ruler represents the whole nation, not any clique or party in it. The Democratic South receives President Taft with salvos of applause when he visits them, Republican tho he is; and even British Socialists and Laborites would do an ungallant and inhospitable act in insulting the Czar on his approaching visit of peace.

A Creed for South Africa

We are interested in the creed on which four denominations in South Africa—Presbyterian, Methodist, Baptist and Congregational—propose to unite and form one body, for what it omits as much as for what it includes. It is as follows:

"I. This Church acknowledges and receives the Word of God delivered in the Old and New Testaments as its standard of faith and life.

"II. It accepts and holds as the central message of Scripture the evangel of the Lord and Saviour Jesus Christ, Who loved us and gave Himself for us; in Whom God is revealed as the righteous and loving Father Who is not willing that any should perish but that all should come to repentance; thru Whom God has established His kingdom on earth; and by whom the Holy Spirit draws men to faith and penitence, inspires them to a life of service, and brings them into ever deeper harmony with God's Holy Will.

"III. This Church exists for the proclamation of Christ's Gospel and the extension of His kingdom."

Compare the above with the Apostles' Creed. There is nothing in it about "conceived of the Holy Ghost, born of the Virgin Mary, suffered under Pontius Pilate, was crucified, dead and buried; he descended into Hell, the third day he rose from the dead; he ascended into Heaven and sitteth at the right hand of God the Father Almighty; from thence he shall come to judge the quick and the dead." Instead of this biography as all important, we have Jesus Christ loved us and gave Himself for us; that God is a loving Father who wishes all to come to repentance, and is establishing his kingdom on earth; that faith, penitence and service brings us into harmony with God, and that this is Christ's gospel. Nothing is denied that is in the old creed and little is asserted. The difference is in the emphasis, and this is put on char-

acter and trust in a loving Father in Heaven. The Christian people in South Africa seem to be as advanced as those in this country. More advanced in union. Here these four denominations could not think of uniting and will not for ten years. Why not?

We do not know that Father Tyrrell's death was hastened by his removal from the Jesuit order, but it might well have done so. He was a convert, and the act which deprived him of the right to say mass did not separate him from the Church he had joined. He sought its last offices, but he did not retract his liberal heresies. The immediate occasion of his expulsion was a long private letter which he wrote to a friend, showing how there could be a reconciliation between the Church and modern science. This letter was copied and handed around on the Continent, and was finally printed without his name, but its authorship was traced to him. When charged with heresy he remained contumacious and wrote freely in defense of his position. In his death, as in his doctrine, he follows his friend St. George Mivart, who, after writing in defense of the Church, was excommunicated by Cardinal Vaughan.

The remarkable fact about the new German Chancellor is that he is a commoner. He is called "Dr.," not Prince or Count. He has never served as diplomat in foreign courts, like his predecessors, Caprivi, Hohenlohe and Von Buelow. He has worked his way up in the civil service, and began by passing an examination. He has no personal knowledge of foreign capitals, for he has never had service in them. He is a hard working man at the desk, and he knows Germany. But Von Buelow trusted and recommended him. May we not understand that the Emperor does not rule as much as he did, and that a man is needed who knows Germany and can deal successfully with the Reichstag. We may hope that under him Germany may cease to be regarded as a menace to peace.

The members of the Georgia State Senate and House have signed a petition to President Taft, asking him to appoint

a certain white man as Collector of Internal Revenue at Atlanta. But there is no vacancy, President Taft may probably tell them. Henry Rucker, a colored man, to be sure, has held the office creditably under President McKinley and President Roosevelt, and it is trouble President Taft will get into if he lets it be understood colored men must be turned out of office to make room for white men. Three Georgia arbitrators have lately given him a good precedent in refusing to remove the colored firemen from the Georgia Railroad.

The Rev. Johnston Myers, pastor of the Emmanuel Baptist Church, of Chicago, is quoted as saying:

"I will inaugurate a fight against the University of Chicago that will be nation-wide in its proportions; I will see that the institution is so generally denounced that the people of the United States will look upon it with horror; I will work until no reputable students go there, and before the fight is done the University of Chicago will have ceased to exist."

Mr. Myers has undertaken no light task. He ought to give at least a week to it. Possibly he overrates his ability. A fly once resolved to eat up an ox: but the ox felt the first bite, swung its tail to the right spot, and afterward there was no fly there. This fable might teach something to Mr. Myers.

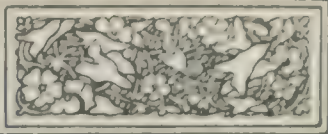

Mr. William J. Bryan is very kind to President Taft in offering to give whatever assistance he can render to the President to secure the ratification of both amendments to the Constitution, if the President will add an amendment for popular election of Senators to that authorizing an income tax. Mr. Bryan is unwilling to consider himself as a back number.

Aigrettes, or heron plumes, smuggled to this port, were seized, condemned, ordered sold, but afterward ordered destroyed, as it is illegal to have them offered for sale in this State. It is a good law. If folks want to wear heron's plumes, let them raise herons for the purpose, as they raise ostriches and peacocks. Then it will be decent for a woman to put the slender, swaying vanities in her hat, and no wrong done.

Insurance

The Chinese Plan Americanized?

THE Chinese people are reputed to have a system whereby their physicians are kept under pay so long as those retaining their services remain well. When sickness comes the doctor's emolument ceases. Possibly we may find the Chinese system to be superior to ours and make substitutions. At any rate, Dr. Benedict, before the American Academy of Medicine, recently presented a plan under which physicians should contract with their patients for attendance during health upon a yearly basis. Dr. Benedict's idea was in a measure, at least, to follow the lead of the Chinese, in that the prevention of disease should be sought after rather than a cure after it had made its appearance. Health conservation was to be accomplished thru the medium of periodic examinations and advice, whereby disease should be detected in its incipency and a cure brought about before the chronic stage had been reached. Certain features of this idea have already been broached in insurance circles by Burnside Foster, M. D., the chief medical examiner of the New England Mutual Life Insurance Company for Minnesota, and editor of the *St. Paul Medical Journal*, and to which reference was made in our issue of April 8. Possibly the insurance companies and the doctors may become competitive in this field, but the Chinese idea appears to have had modern reincarnation that promises much in the working out.

Accident Underwriters' Convention at Niagara Falls

THE International Association of Accident Underwriters was in a four-days' convention at Niagara Falls last week. Fifty-eight companies were represented. Present and prospective legislation and the increasing activities of the insurance commissioners formed the subjects of discussion. The president of the convention, H. G. B. Alexander, of Chicago, in his annual address, laid particular stress upon the subject of legislation and

how it will affect accident underwriters. He said in part as follows:

"If I read the signs of the time aright the next few years, perhaps the very next year, will be the most critical time in the history of accident and health insurance—the time in which it will be determined with lasting effect what degree of State supervision shall be exercised over our policy contracts and how far we shall be left free agents to sell that which the public desires and which we can afford to sell at an obtainable price. It seems to me that this crisis is near at hand, and I feel that the chief object of this brief address should be to present to you this thought that we should counsel together wisely and effectively to produce the best results in safeguarding our interests.

* * * * *

"As accident underwriters we are of course reaping a certain benefit from the publicity at present being given to the perils which beset workers in industrialism. The United States Bureau of Labor reports that every year more than thirty thousand workmen lose their lives while engaged in duties incident to their regular vocations. Reports issued by the Census Bureau show that of deaths in insurable males almost 10 per cent. are due to accident. This publicity has given rise to a careful consideration in many quarters of means for reducing the number of injuries and deaths from accidental causes, with the result that the past year has witnessed the organization of a considerable number of institutions having in view the minimization of the industrial toll of death and disability. Every such effort deserves and has our earnest approval and co-operation, for the constant and rapid increase in the number of accidents incident to all occupations renders imperative a reduction in another channel if our present moderate rates are to be maintained."

✱

WHEN the vacationist is free from the cares and worries of everyday business and rises each morning on pleasure bent, he is liable to run hazards that may easily be designated vacation perils, because that is exactly what they are. Drowning at the seaside is a frequent casualty; the number of accidents in which automobiles figure is constantly increasing; the mountain climber may break his leg; horses do sometimes get frightened and cause accidents; the lake bather may have cramps, and those who rock boats may do so once too often. The vacation has its perils, against which accident insurance is calculated to provide.

Financial

Fiscal Year's Foreign Trade

OWING to an increase of imports and a much larger decrease of exports, the foreign trade reports for the fiscal year show the smallest excess (\$351,178,316) of exports since 1897. The increase of imports was mainly in materials for manufacture, testifying to improvement in business, while the loss in exports was chiefly in breadstuffs and meats, grain and flour accounting for nearly \$55,000,000 of the entire decrease of \$197,000,000. Below are the figures for the last five years:

Fiscal year.	Exports.	Imports.	Excess.
1909 ..	\$1,003,120,008	\$1,311,048,502	\$351,178,316
1908 ..	1,800,773,346	1,194,341,792	606,431,554
1907 ..	1,880,851,078	1,434,421,425	446,429,653
1906 ..	1,753,864,500	1,117,513,071	401,048,595
1905 ..	1,460,827,271	991,087,371	469,739,900

June, the closing month of the year, was the first month in twelve years to show an excess (\$7,158,000) of imports, but in no preceding June had the imports been so large. In the movement of gold, the record of 1908 was reversed, an export excess of \$47,500,000 following an import excess of nearly \$76,000,000, which was due to the demand during the panic. In the movement of silver, an export excess of \$11,727,000 for the year is shown.

The Upward Movement

SIGNS of marked improvement continue to be shown in the iron and steel industry. Prices were advanced last week, and several of the leading independent companies have orders to keep them busy until January. The great Corporation is operating 92 per cent. of its full capacity, which is said to be equivalent to 100 per cent. in 1908. Within a few days the railroads have asked for bids on 34,000 steel freight cars. The Pennsylvania needs 20,000, the Northwestern 6,000, and the Baltimore & Ohio seeks to place orders for 6,000, and also for 70 passenger cars and 65 locomotives. Just before sailing for Europe, last week, Judge Gary, chairman of the Steel Corporation, said:

"I am leaving with an easy mind and under the most favorable conditions so far as the

business of the Steel Corporation in particular, and the outlook generally, is concerned. Prices are certainly advancing, and orders for future deliveries are accumulating. Signs of activity and increased demand are everywhere apparent. Orders have so accumulated on the books of the Steel Corporation that it has become necessary to start additional furnaces, and the production is now greater than it has been since the banner season of 1907. Nearly all of the plants are running full capacity, and some are so overcrowded with orders that deliveries are delayed. Constantly increasing production is not keeping pace with demand, however, and demand is not prompted by any desire to accumulate stock, but is occasioned by actual immediate consumption. I mention these facts merely to show the basis for my belief that we are entering on an era of prosperity of greater or less duration, and I firmly believe that it will prove greater than any for years past. With good crops—for which we have every reason to hope—I see a long season of great prosperity ahead for all lines of business."

It is due partly to the condition of the steel industry that Steel common shares rose in the market last week to 73. At that price the return to the investor is only a little more than 2½ per cent., but many expect that the dividend will soon be increased. These shares were sold at 41¼ in February.

Railroad gross earnings in June showed an increase of 10½ per cent. Building operations in one hundred cities for the June quarter exceeded those of a year ago by 46 per cent., and the increase for the half year was 61½ per cent.

....Consul Seyfert reports from Ontario that about \$175,000,000 has been invested in Canada by manufacturers of the United States, in the establishment of branch factories there. He adds \$40,000,000 for capital invested by Americans in the Canadian lumber trade.

....At the annual convention of the New York State Bankers' Association, last week, F. E. Lyford, of Waverly, retiring vice-president and candidate of the majority of the nominating committee for president, was defeated because of his advocacy, two years ago, of a Government guarantee of deposits. Ledyard Cogswell, of Albany, was elected, receiving 89 votes, while 38 were cast for Mr. Lyford.

No. 3165

Survey of the World

Tariff Rates in Conference

At the end of last week no final decision concerning those tariff rates as to which Mr. Taft has shown so much interest had been reached by the conference committee. Thruout the week the members of the committee and other prominent Senators or Representatives were repeatedly in conference with the President at the White House. On Wednesday evening a conference there followed a dinner, at which were present (in addition to the committee) Vice President Sherman, Speaker Cannon, Secretary MacVeagh, Attorney-General Wickersham, Senator Root and Senator Crane. It was admitted afterward that very little had been accomplished at this meeting. Senator Aldrich asserted that a report providing for free iron ore, hides, coal and petroleum would be rejected in the Senate, and Mr. Payne's opinion was that such a report might pass in the House. The President's views remained unchanged, however, and in the following days some progress was made in the direction of his policy. On Friday, it was reported that the committee had decided for free hides and oil, with reduced duties on coal and lumber, but on Saturday it was asserted that the tentative agreement had been laid aside. There is no official report of the committee's work. Mr. Taft urged that, if certain raw materials were made free, the duties on finished products ought to be reduced, and he proposed large reductions of the duties on shoes and other manufactures of leather. It was pointed out to him that the rules did not permit the committee to make such reductions, and that the passage of a concurrent resolution of instructions would be required. The Republican leaders are

unwilling to propose such a resolution because it would reopen debate (in the Senate, at least) and be subject to many amendments. The President also became convinced that the proposed duties on cotton and woolen goods were too high. At the end of the week the result was not clearly foreseen at Washington, but it was said that the House was inclined to insist upon a report acceptable to Mr. Taft. It was also said, however, that action by the committee for downward revision was precluded by the rules, so far as a large majority of the tariff rates were concerned. It was reported that 18 Republicans in the Senate and 45 in the House would vote against the free list desired by the President. —At the session of the committee on the 20th, Mr. Payne proposed this free list, and was opposed by Mr. Aldrich and a majority of the House conferees. He also suggested a reduction of the Senate's high rates on cotton goods, in which Mr. Aldrich is deeply interested. In return, there was a suggestion for a reduction of the House's increased rates on hosiery and gloves. This is said to have been opposed by Mr. Payne. His dissatisfaction was so great that he took his hat and left the room. Good feeling was restored, however, on the following day. Published reports as to the committee's action are not authoritative. It is known, however, that in most cases there has been a compromise between the differing rates of the Senate and the House. The net earnings tax has been accepted, with a reduction of the rate to 1 per cent. Holding companies are exempted, but it is said that mutual insurance companies must pay. —Senator Cummins has published a statement which probably represents the views of

Cases of Bribery and Fraud

The second trial of Patrick Calhoun, president of the street railway company in San Francisco, was begun on the 19th. In the first trial he was accused of bribing Supervisor Nicholas to procure a franchise for an overhead trolley. This time the charge is that he bribed Supervisor Furey. Both of these supervisors are among those who confest to the authorities. In a pamphlet prepared and circulated in the interest of Mr. Calhoun and his associates it is asserted that Prosecutor Francis J. Heney, as an employee of the Department of Justice, has received a considerable sum of money for which no service was rendered. This charge was made in the House, at Washington, last week, by Mr. Tawney, of the Appropriations Committee, the sum specified being \$23,000, paid last year. Mr. Heney says the money was paid for work done (in land fraud cases) before he was employed at San Francisco, and that payment was delayed. —In Chicago, a police inspector, a detective and eight other persons were indicted last week for receiving bribes for the protection of vice. It is alleged that the detective has been collecting, for himself and his superiors, \$9,000 a month. —In Pennsylvania, the conviction of the men accused of conspiracy to defraud the State in connection with the furnishings of the new Capitol has been confirmed by the Superior Court. Failing successful appeal, William P. Snyder, formerly Attorney General, and J. M. Shumaker, formerly Superintendent of Public Buildings, must be imprisoned for two years. John H. Sanderson, contractor, and ex-Treasurer Mathues were also convicted, but have since died.

Labor Disputes

At the beginning of the present week a settlement of the strike of the employees of the Pressed Steel Car Company, at McKee's Rocks, Pa., seemed near at hand, as the company had consented to take back 500 of the 600 principal strikers and had promised to establish a bureau of information, designed to prevent the exaction of taxes and bribes by foremen. The pastor of the local Catholic Church and others testify that the men have been badly treated by subordinate officers. Thruout last week the strikers prevented

the employment of men in their places. The Pittsburgh Public Defense Association, a civic organization, applied to the local court for injunctions against both parties, to restrain the men from trespassing on the company's property, and the company from discharging them or employing strike-breakers. The court sustained the company's demurrer, holding that it had no jurisdiction. —The strike at the plant of the Standard Car Company, in Butler, Pa., was settled on the 20th by mutual concessions, owing to the efforts of the pastor of the local Polish Catholic Church, but many of the 3,500 men declined to resume work until the company should sign a written agreement to make the increase of wages which had been promised. No further trouble, however, is expected. —There have been riots at the Steel Corporation's tin plate factories in Elwood, Ind., Newcastle, Pa., and Wheeling, W. Va., owing to the strike against an open shop. Several persons were shot, but in no case were the injuries fatal. At Elwood and Wheeling injunctions have been granted by Federal courts. —At Cleveland, Ohio, last week, in riots connected with the strike of men formerly employed on the lake freight boats, three men were killed. They were union men, and they were shot while making attacks upon non-union men serving in their places.

The Quarrel in South America

Diplomatic relations between Bolivia and Argentina were ruptured on the 20th, when the Argentine Government recalled its Minister at La Paz and gave the Bolivian Minister at Buenos Ayres his passports, asking him to leave the country within twenty-four hours. This action followed Bolivia's refusal to accept the Argentine President's decision in the boundary dispute, but was due mainly to the Bolivian President's circular note to the provincial governors in his country, and to his order that the centenary festivities in Bolivia should be suspended because of the "national misfortune." In the note there were offensive references to the Argentine Government. At once there were offers of thousands of volunteers for the Bolivian army, but at last reports

war was not expected. In a semi official editorial, the *Diario*, of La Paz, said on the 21st:

"Argentina has placed Bolivia and Peru in an extremely delicate situation. The object of the arbitration was to seal the permanent friendship of the two nations, but the monstrous injustice of the award has resulted in placing them on the verge of war. The Argentine press says that Bolivia's repudiation means war with Peru. We do not wish such an extreme. Neither Peru nor Bolivia is prepared for war. A solution should be found in the way of peace and equity, avoiding a desperate situation. We ask Peru to respect Bolivian possession; if that is impossible it is likewise impossible for Bolivia to comply with an award where national sentiment is so strongly opposed to it. Bolivia would be justified in retaining those regions were the whole republic drenched in blood."

Bolivian interests in Buenos Ayres and those of Argentina in La Paz have been intrusted to the United States Ministers at those capitals. Our Minister at Buenos Ayres is actively engaged in promoting a peaceful settlement. It was reported on the 22d that Peru had consented to negotiate directly with Bolivia concerning the award. Argentina holds that Bolivia should first recognize the award and make amends for the indignities which caused the rupture. Two years ago the Argentine President consented to act as arbitrator in a boundary dispute between Bolivia and Paraguay. He gave notice to Paraguay last week of his withdrawal from the case.—A contract with the National City Bank, of New York, has been signed, for a new loan of about \$12,000,000, covering Costa Rica's foreign debt. Heretofore all of Costa Rica's loans have been negotiated in England. Negotiations are pending with a New York syndicate for a refunding of the foreign debt of Honduras, which amounts to about \$110,000,000, face value, and upon which no interest has been paid for many years. A majority of the bonds are held in England.

A Flight Across the Channel

The prize of \$5,000 offered by the London *Daily Mail* has stimulated aviators to attempt a crossing of the English Channel, a feat not so difficult in itself as other flights that have been accomplished in England and America, but one which has special attractions on account of its significance

and spectacular character. Hubert Latham, in an Antoinette monoplane, tried the crossing on the 19th and dropped in the midst of the Channel. The aeroplane floated on account of the air chamber inclosed by the double wings, and when the French destroyer which was in attendance caught up with him, he was perched high and dry on top of the machine, calmly smoking a cigarette. Count Lambert, who was also at Calais with the Wright biplane, has not attempted the passage, but on Sunday morning, July 25, Louis Bleriot, in his monoplane successfully crossed the Channel, landing near Dover. After a trial flight around Calais of nine miles, he started at 4:35. The French destroyer "Escopette" followed him, but was soon lost to view and for ten minutes the aeronaut was alone over the water out of sight of land. As he neared the Dover cliffs he found it difficult to effect a landing because of the cross-currents in the air. His machine was whirled around three times, and on striking the ground the propeller was broken. The flight of about 21 miles was made in 23 minutes. He kept as nearly as possible to a height of 250 feet above the water. M. Bleriot is a French engineer, thirty-seven years old, and has distinguished himself by his daring flights, in which he has met with a number of accidents, but without any serious injury. In a recent fall his foot was burnt, and he laid aside crutches to get into his aeroplane at Calais. His machine is one of the smallest aeroplanes that has been tried, consisting simply of two wings, about 14 feet long and 6 feet wide, and a long tail with a rudder, which gives the machine the appearance of a dragon-fly rather than a bird. On the day before his Channel flight he received the decoration of the Legion of Honor, which was awarded at the same time to four other Frenchmen who had distinguished themselves in the construction or use of aeroplanes.

The Fall of Clemenceau

The overthrow of the Clemenceau Government came very unexpectedly on July 20 as the immediate result of an incautious remark made by the Premier in the heat of debate. The Chamber of Deputies usually adjourns for the summer

vacation before July 14, but this year had held over longer in order to finish the consideration of the report of the investigation committee on naval affairs. M. Delcassé, former Minister of Foreign Affairs, was chairman of the committee, which had exposed an appalling amount of corruption, extravagance and inefficiency. Guns and ammunition of an obsolete type had been manufactured. Defective armor plates had been accepted. There are no dry docks in France capable of accommodating the six vessels of the "Danton" type, corresponding to the British "Dreadnought," and if these are completed by 1911 as planned their equipment would not be ready until three years later. The former Ministers of Marine, M. Pelletan and M. Thomson, were held responsible for this condition of affairs and M. Picard, who had recently been appointed to that office, expressed a willingness to comply with the recommendations of the committee. The Premier, resenting the criticism of M. Delcassé, said it was not becoming in a man who brought France to Algeciras to accuse the Government of carelessness in regard to the national defense; an allusion to the fact that the opposition of Germany to Delcassé's Moroccan policy had compelled the Government to dismiss him from the cabinet and refer the question to an international conference at Algeciras. In reply M. Delcassé defended his foreign policy as one of peace, bringing about agreement with Spain, Italy and England, and mediation between Russia and England. Then turning to M. Clemenceau, he said:

"You were chairman of the naval investigating committees of 1904. Your unsparing attacks upon every Government for twenty-five years seemed sufficient guarantee that you would find the root of the evil. Why did your committee never bring in a report?"

The Premier retorted: "Your policy brought upon France the greatest humiliation she has experienced in twenty years." This aroused a storm of protests. The Premier lost control of himself and shouted above the tumult:

"Oh, no false indignation, I pray you. You brought us to the verge of war without military preparation. Yes, everybody knew that when the question then was put to the Ministers of War and Marine they replied that France was not ready. I have not humiliated France. Delcassé has."

Amid the excitement caused by this home thrust the vote on the order of the day was then taken and the Government was discredited by a vote of 212 to 176. The defeated Premier put on his hat and walked out. Less than ten days before he had boasted that his Government had survived 293 interpellations. There is little doubt that the Chamber was prepared to support him again when he made this unfortunate reference to the concession which France had been compelled to make to Germany. It was a combination of the extreme Left and Right aided by a defection of about fifty members of the "Bloc" which brought about his defeat. This is an example of the danger of absenteeism against which the Chamber has recently ruled. More than sixty members of the majority were absent on a parliamentary visit to Sweden.

The Briand Cabinet

The fall of Clemenceau was due to a personal indiscretion rather than any dissatisfaction with his policies. As Henri Rochefort says in the *Patrie*:

"Clemenceau has overthrown so many Ministers that he believed it proper to overthrow himself. He committed suicide yesterday by firing several phrases at his own head."

His overthrow, therefore, does not necessarily involve a decided change in the policy of the Government. He is succeeded as Premier by M. Aristide Briand, former Minister of Justice and Worship, and of the twelve men who form his cabinet, six were in that of the late Premier. The new cabinet will probably be quite as radical as the old, for four of its members, M. Briand, who becomes Minister of the Interior, M. Millerand, Minister of Public Works, Posts and Telegraphs, M. Barthou, Minister of Justice, and M. Viviani, have been known as Socialists, although they were of course dropped from the party some years ago on their taking positions in the Government, and have by their assumption of responsibility become more moderate in their views. On the other hand, M. Caillaux, Minister of Finance in the old cabinet, has been dropped, and this looks like a concession to the Senate, which has been decidedly opposed to the income tax and pension bills, of which

M. Caillaux was the author. His place is taken by M. Cochery, who was Minister of Finance in the Meline cabinet of 1896-1898. Since the management of the army and navy has been the source of greatest embarrassment to the governments of recent years, these portfolios have been placed in the hands of professionals instead of laymen as before. Admiral Boué de la Payrère becomes Minister of Marine, and General Brun Minister of War. Another embarrassing factor has been eliminated by the abolition of the office of Under Secretary of Posts and Telegraphs, occupied by M. Simyan, against whom the recent strike of the postal employees was directed. The new Premier, M. Briand, is only forty-seven years old and recently came into prominence thru the drafting of the bill which accomplished the separation of Church and State in France. He is an outspoken atheist and an advocate of free divorce. The new Briand Ministry has announced its determination to devote special attention to the settlement of labor conflicts, which have assumed so dangerous a form in France. The first official announcement quotes the remark of M. Waldeck-Rousseau, "Capital must work and labor possess," and insists upon the necessity of an alliance between labor and capital and the avoidance of every cause of conflict; that the members of the cabinet, regardless of their political affiliations, resolve, with the aid of Parliament, to ameliorate the moral and material well-being of the workers as far as in their power lies, but that the accomplishment of this end will depend upon the support of the workers themselves; that the latter must give security to capital or otherwise undertakings will be abandoned and the economic development of the country arrested. It is reported that the moderate and conciliatory views of the American labor leader, Samuel Gompers, now in Paris, have exercised a strong influence on public opinion and on the attitude of the Government.

The New German Chancellor

In accordance with his previous announcement, Chancellor von Bulow resigned as soon as the Finance Bill was passed by the Reichstag. He

was given the privilege of nominating his successor, Dr. Theobald von Bethmann-Hollweg, who has been Secretary of the Interior and Vice Chancellor. The new Chancellor was born in 1856 and has spent his life in administration work in provincial positions and in the Prussian and Imperial Cabinet. He has been from his youth a close friend of the Kaiser. They belonged to the same fraternity at the University of Bonn, the Borussia Corps. As provincial president of Pots-

DR. THEOBALD BETHMANN-HOLLWEG.
When he was Prince-Bishop of the German Empire.

dam in 1896 he was again brought into association with Emperor William and in 1905 was made Minister of the Interior. He has had, however, no diplomatic experience, and it is expected that he will not offer much opposition to anything the Emperor chooses to do. In appointing him the Emperor has shown his disregard to the anti-Semitic prejudices of the German aristocracy, as he did when he made Herr Dernburg Colonial Secretary. The Bethmanns were Jews who

were driven from Holland in the seventeenth century.

The Spanish in Morocco

The fighting on the Riff coast is doubly embarrassing to the Spanish Government because a war in Morocco is extremely obnoxious to the Spanish people, and there seems to be no possibility of carrying it to a successful conclusion with the troops and money at command. The fanaticism of the Kabyle tribesmen has been aroused by the exhortations of the mollahs, and 20,000 of them have gathered in the vicinity of Melilla. They are armed with Mauser rifles which were bought back from the West Indies at the close of the Spanish-American War, and were sold to the natives by the governor at Melilla, for his personal profit. General Marina, who is in charge of the Spanish forces at Melilla, has only about 8,000 men at his disposal, and it is impossible for him to follow the Kabyles into their mountain homes. He has indeed found it difficult enough to keep clear the immediate neighborhood of Melilla, for the Moors charge the Spanish with reckless daring, and have at times come within 800 yards of the city. An attempt was made on July 23 to drive back the Moors, but the Spanish were not able to hold the ground that they gained, and on retreating toward Melilla they were repeatedly charged and could only keep off their assailants by hand-to-hand fighting. On the Spanish side six officers were killed and thirteen wounded. The number of soldiers killed is not reported definitely, but is estimated at nearly 300. The natives probably lost over a thousand. General Marina will require 30,000 or 40,000 troops in order to take the offensive. The best regiments in Spain are being dispatched to his support, in spite of the opposition, which has taken the form of riot and mutiny. Three companies of chasseurs at Madrid refused to obey orders for embarkation, altho they were in the presence of the King, who had gone to the barracks to bid them farewell. The crowds around the railway station tried to wreck the cars, and the wives and children of the soldiers who were being sent to the front took part in the tumult,

many of them being injured when the police charged the mob. The Liberals and Republicans are protesting against the action of the Government by all possible means, but mass meetings are prohibited and their papers are suppressed. In reply to the demand for a convocation of Parliament, Premier Maura de-

THE CHILD SHAH

Ahmed Muza, who, at the age of twelve years, has been placed on the throne of Persia by the Constitutionalists.

clares that it is unnecessary, as the Government has not in any way changed its policy. One cause of the hostility to the war is the fact that the reservists of 1903-4-5, who have been mobilized, are many of them married men, and in some cases their families are left without support.

The Cleveland Referendum, August 3

BY EDWARD W. BEMIS, Ph.D.

AUTHOR OF "MUNICIPAL MONOPOLIES," SUPERINTENDENT OF CLEVELAND CITY WATER DEPARTMENT.

THE country is hardly aware of the great referendum campaign which is in progress in Cleveland on street railway matters. Neither is it aware that over one-third of the street-car riders have enjoyed three-cent fare uninterruptedly for over a year. The way the country at large has been led to believe that three-cent fare is a failure here is a striking illustration of the difference between the accuracy with which newspapers report ball games or market quotations on the one hand and news of a political and sociological significance on the other. The entire street railway system of Cleveland gave three-cent fare within the city limits without even a charge for transfers during the six months from August 1, 1908, until February 1, 1909. Three months of this were under the management of the Municipal Traction Company and three months under the receivership appointed by Judge Tayler, of the United States District Court. Since February 1 the Judge has held that his duties to the various owners of the property required his charging the maximum fares that the various franchises would permit. On not quite two-thirds of the system this means until next January a five-cent fare, with eleven tickets for fifty cents, but on a little over one-third of the system it means still three cents. The passengers on these lines are entitled to free transfers from one three-cent line to another, but on the other hand might be compelled to pay an additional five-cent fare if they transferred to one of the five-

cent lines; therefore, an amicable arrangement was made for the present year to permit the three-cent riders to transfer to other lines for two cents for transfers, and also to pay the same amount in transferring from one three-cent line to another. The franchises on about one-third of the property expire next January, and the city administration has granted the franchise to the only bidder, Herman Schmidt, who is backed by men of large wealth and high standing and by the majority of those who helped to build the present three-cent lines. The new company, known as the Cleveland Traction Company, has accepted a franchise under which it can never charge more than three cents under its fourteen-year grant, and is under the constant control of the city with respect to service and bookkeeping. The Council, however, cannot force such an increase of service as will prevent the earning of 6 per cent. on the actual cost of the property. If at any time the profit exceeds 6 per cent., the rate of fare shall be reduced.

By fortunate provision in the franchise of the three-cent lines, known as the Forest City lines, they must give and accept free transfers with other lines that will extend to them the same service, by being ordered so to do by the Council. There will, therefore, be three-cent fare and free transfers between the lines now carrying over 70 per cent. of the passengers, and it is predicted that the old company, retaining only three important lines—the Euclid, Cedar and Broadway—will

have to reduce fares or come to terms after next January, altho on those streets the franchises extend until 1913 and 1914.

Under the Ohio law, a petition signed by both friends and foes of the existing measure led the Council to order a referendum for August 3. The Mayor is nightly addressing audiences of 1,500 to 3,000 in tent meetings on vacant lots in every ward of the city. The audiences are enthusiastic, and after addresses by the City Solicitor, Mr. Newton D. Baker, and the Mayor, and preceding the closing address by the City Clerk, Peter Witt, questions are hurled at the Mayor and answered by him in a brilliant manner. The opposition deferred its public meetings until the last two weeks of the campaign and confined itself previously to circulars. The Chamber of Commerce, of somewhat over 1,500 members, of which 400 own over one-half the stock of the old company, and the banks, the advertisers and the newspapers, and a large portion of the well-to-do people of the city, are against the Schmidt franchise and in favor of a plan suggested by Judge Tayler. This contemplated giving a twenty-five-year grant for the entire system to the old company, known as the Cleveland Railway, which should be allowed to charge from year to year such rates of fare as would always net 6 per cent. on its actual value. The maximum fare, however, was not to exceed five cents cash, seven tickets for a quarter, and a cent for transfers, where tickets were used. Provisions for supervising the service and accounts by the city were included. Judge Tayler believed that the maximum fare would not be necessary, but the president and directors of the old company held that not only would the maximum fare soon be necessary, but that long before the twenty-five years were expired an even higher rate of fare would be required and would be granted by the Council. The company had large interests in the success of high fares in Rochester, Syracuse and elsewhere. It was also contended that the old company would be handicapped in giving low fares by over \$7,000,000 of franchise, good will and pavement values, which had been conceded in a trade or bargain for settlement in the spring of 1908, but

which should not have been conceded, and which would not be in the capitalization of the Cleveland Traction Company. The company broke off negotiations when the Council voted to leave the arbitration of values to Judge Tayler and to postpone the fixing of the maximum and initial rates of fare until his decision on values. When the old settlement had been made in April, 1908, the Cleveland Railway Company had agreed to return the Forest City Company to its stockholders if the settlement was not brought to a close satisfactorily to its representative, Mr. F. H. Goff, and to the city's representative, Mayor Johnson, but has since refused to make such return of the property, altho both Messrs. Goff and Johnson hold that, on account of the referendum vote of last October, the contract calls for the return of the property. This leads to charges of bad faith against the old company and greatly handicaps a settlement.

The receivership was not appointed because of any decision by the judge that the Municipal Traction Company, which operated the roads last summer under three-cent fare, was bankrupt or failing to meet all obligations, but because the defeat of the underlying grant in a close referendum vote in October, and the fact that only a few franchises would extend after next January, jeopardized the interest of bondholders and other creditors, and a court control was desirable until a final settlement of the street railway problem could be made. The three-cent lines, helped somewhat by many riding on them who might otherwise ride on the five-cent lines where the fare was the same, have been doing very well financially. The entire history of the last year's returns by the traction company and the receivers showed that, even with the old valuation of \$100,000 a mile, three-cent fare and a cent for transfers inside the city limits, and five cents in the suburbs, would be sufficient for good service and a 6 per cent. return during the next few years, and probably a lower fare after that. These facts also show that on the basis of physical value alone a three-cent fare even now is ample. The referendum of August 3 deserves the attention of the entire country.

Publicity Campaigning

BY A CAMPAIGNER

AMONG the many men of many minds who are giving serious thought to the problem of governmental regulation of corporations—which have grown so rapidly and so enormously in the last quarter of a century that they have outstripped the enactment of statutes for their proper control—varied as are the views of these men on the extent and the kind of legislation needed, there appears to be a remarkable unanimity of opinion on one point. Practically all the doctors agree that the first step toward proper governmental control is the requirement of full publicity. Especially is this held to be true of public service companies—those corporations which operate street railways, or deal in gas or electric light, or provide other “public utilities” necessary to the comfort and well being of twentieth century civilization.

In recent years the managers of many corporations of various kinds have awakened to the desirability of popular friendliness for their companies and have sought to mold public opinion nearer to their desires by the employment of “press agents,” some of whom have attempted to fill the newspapers of the country with “tainted news” about the corporations they serve. But the utter folly of such a course must soon become apparent even to the worst offender. No matter how clever he may be, a malicious or even a careless press agent is the costliest of luxuries even for the richest of corporations. The taint in the “news” he disseminates is quickly discovered. The ire of press and public alike is aroused. And inevitably such a procedure reacts to the discredit of the company following it. The last state of that corporation is worse than the first.

But a few corporation managers have found the wisdom to go fairly and squarely before the public with their side of any controversy or difficulty in which they were concerned. And this has led to the development of “Publicity Campaigning.” To say that the best channel of publicity in any American community is

the daily newspaper is to utter a truism known to all; for we are a people of newspaper readers.

“Publicity Campaigning,” then, is a new form of advertising—the highest form that has yet been developed in this land of the advertiser. Some account of one or two typical examples, out of several campaigns conducted by the writer of this article, will help perhaps to make these things clear to the reader and serve to spread a more enlightened understanding of just what is meant by honest publicity and publicity campaigning for public service corporations.

One of the first companies in the United States progressive enough to try the experiment of a publicity campaign was the Roanoke Railway and Electric Company, of Roanoke, Va., an attractive, healthful and progressive little city of some 35,000 people, situated between the Blue Ridge and Alleghany mountains in the southwestern part of the “Old Dominion.” This company, as its name indicates, operates the street railways of Roanoke and does an electric lighting business, in which it enjoyed a monopoly until early in the autumn of 1906, when a rival company started in with cut rates and by insinuations of “robbery,” “extortion” and open charges of unfairness soon succeeded in stirring up a deal of bitter feeling against the older company. Several other things had added fuel to the fire of discontent—among them the fact that the main business streets of the city were torn up for repaving and remained in a chaotic condition for six months or longer. The company paid one-third of the cost of the new pavement in all the streets traversed by its tracks, and, furthermore, was required by the city to double track its system in the main business thoroughfares, yet the contractor employed by the city was permitted to take his own time to finish the work and to handle it in such a way as to hamper seriously the running of the street cars on any kind of schedule. Of course, the company received all the blame for this, and, in fact, began to be

blamed for just about everything that went wrong, whether having any connection with it or not. There was an epidemic of "cussing the street railway."

In the hope of bringing about a better understanding of its real position, of what its service meant to the city, and of fostering a better feeling toward the company on the part of the public, a publicity campaign was undertaken. This was started toward the end of November, 1906. It took the form of a daily display advertisement, regularly paid for as an advertisement, three columns wide and twelve or thirteen inches deep, a new one every day, printed in each of the three daily newspapers of Roanoke. The advertisements were called "Electric Talks" and were numbered consecutively. Contracts were made with the papers for 2,000 inches of space to be used in two months' time, and the daily space was apportioned as needed. Before the two months had expired the campaign had been so successful—the company had realized such unmistakable benefits from it—that it was extended for another month.

We started out by telling in these "Electric Talks" just what the company had already done to provide a street railway and an electrical service for Roanoke and to help build up the community; how by extending its lines to new sections and in various other ways it had helped to build up the city, to foster its growth, and to bring more people and more business to it. Then the cost of the improvements made since the present management took hold of the property was taken up in detail and what it meant as a permanent investment for the benefit of the city was explained. Something of the complex and complicated nature of the street railway and electric lighting business was elucidated in an elementary way. It was explained how the double tracking would improve the service, and outlines were given of the company's plans for extensions and other betterments. The company's aims and purposes and its guaranty of a "square deal" to the people were reiterated day after day. It was a campaign of education and a campaign of truth telling. Each "Talk" was new and different from its predecessors—they were not allowed

to become monotonous or uninteresting. Salient points were repeated frequently and driven home by steady hammering, so that there should be no misunderstanding or forgetting of them.

If an accident happened (and several did happen), the company printed a true account of it and announced what steps would be taken to remedy the difficulty and prevent its recurrence. No attempt was made to color in the slightest degree the statements made. Each "Talk" was a plain statement of facts, attractively printed, easy to read and easy to comprehend. There was no equivocation. In a footnote the people were urged to read and ponder the facts presented. We soon had abundant testimony that they were doing so. By the end of the first week "Electric Talks" had become the talk of the town. Everybody was reading them and talking about the company. People began to write letters to the newspapers about them. Some berated the company, but others took its part against the fault-finders. Each of the papers in turn took up the controversy in some aspect and printed editorial articles commending the company for its adoption of a policy of publicity and for its open and fair way of dealing with the public. For the three months of its duration the campaign was the most talked of thing in Roanoke. But long before three months had passed the improvement in public sentiment began to be shown in various ways.

At the outset the proprietor of one of the daily papers had hesitated about entering into a contract to advertise the street railway company—had feared that to do so would compromise him with the public, or that the company would seek to dictate the editorial policy of his paper. He was reassured on that point, but for several days—until he came to understand just what we were doing—he watched the "copy" for the Talks with eagle eye. When he did understand he was the most surprised man in the city. And his surprise soon turned into enthusiasm. After a few days he said:

"You certainly are giving us a right fine line of talks. And the people are reading 'em, yes, sir, everybody is reading 'em. Everybody who comes in here is talking about them. They can't help but do your company a whole lot of good."

Some days later he said:

"I want to tell you that these 'Electric Talks' are not only doing your company a whole lot of good, but they are doing this town good. You're telling the people a lot of things they never knew before, and things they ought to know. I did not have any idea of what the street railway had done for this town. It sure has spent a big pile of money. And telling the people about it is going to help you a lot. Why, before these Talks started, there wasn't a day that I didn't have anywhere from one to a dozen people come in here and ask

Electric Talks

No. 76

This is the last "Electric Talk" we shall print for the present, our appropriation for this purpose now having been spent.

Some of our friends have said that we were "throwing away a lot of money" to pay the newspapers of Roanoke for publishing these Talks. We did not agree with them. That view first suggested the fact that the newspapers of Roanoke are a necessary and a worthy institution, deserving of the support of all the business interests of the city. We are willing to give our share of that support—even if there were no return. But we are satisfied with the return.

Some other people, while admitting that they found these Talks decidedly worth reading, have said we should do better to "spend the money in improving our service." Our answer to that is: We are now spending more than ONE HUNDRED TIMES the amount of money this advertising has cost us in order to make our service in all its branches the BEST IN THE WORLD.

We began and we have continued the publication of these Talks because we had certain things to tell the People of this community good for them to know and good for us to have them know.

We said at the start that we believed PUBLICITY a better business policy than secrecy. The result justifies that belief.

We said we should take the people into our confidence, and conduct our business openly. We have done just that. In these Talks we have told YOU just what we have done and are now doing to provide the BEST POSSIBLE SERVICE in Electric Traction, Electric Light and Electric Power, and to bring more people and more business to Roanoke—to help BUILD UP THIS MAGNIFICENT CITY OF VIRGINIA.

We have had some setbacks—but when troubles and accidents have come we have explained them, have told YOU the truth about them, and what we were doing to remedy the difficulty and prevent its recurrence.

In short, we have told the TRUTH and nothing but the TRUTH. YOU may cite the old saw about confession being good for the soul.

All right! YOU at least concede that there is one corporation in Roanoke that has a soul!

We have proved that we have a genuine interest in the welfare of Roanoke, that we are here to STAY and to SERVE its people in their ELECTRICAL NEEDS to the best of our ability. We have invested the sum of \$694,775 in improvements since 1909 for this very purpose.

We have proved by the figures gathered from all parts of America that our prices for ELECTRICITY ARE LOWER THAN ANY OTHERS.

In return for our confidence we have gained the confidence of many people. We take this opportunity to thank those people for their confidence and to reassure them that it is not misplaced.

Our business is growing faster than ever before. We want it to keep on growing. In anticipation of a still greater growth we are planning to build a NEW AND THOROUGHLY MODERN CENTRAL POWER STATION that will enable us to provide the BEST SERVICE IN THE WORLD and that will generate ELECTRICITY at a minimum cost—so that no other company will ever be able to undersell us, no matter how its current is generated.

YOU NEED ELECTRICITY.

We can supply your need better and cheaper than any one else.

And when you deal with us we GUARANTEE fair and square treatment.

Roanoke Railway & Electric Company.

Before the campaign ended this editor assured the company that its "Electric Talks" constituted the "best advertising that ever was done in the city of Roanoke."

People generally, before the campaign had run its full course, came to admit to themselves and to one another that the street railway company was not so bad, after all; that it had done some things for the benefit of the city, and that at least, when charges were made against it, it deserved a hearing for its side before final judgment was passed.

Before the three months' campaign was ended everybody connected with the street railway management was not only abundantly satisfied with its results, but indeed surprised that its benefits were vastly larger, more direct and more pronounced than any of them had dared to hope for. Not alone were the newspapers and the public generally won over to a friendlier feeling toward the company—the campaign gained the good will of a host of people who, in their misunderstanding of the company's true position, had been inclined to be hostile critics—but incidentally the concern's lighting business received the biggest impetus it had ever known in the eighteen years of its history. Its rival company was never mentioned in the "Electric Talks." Yet that rival was fairly driven to the woods. The increased lighting and power business resulting from the campaign swamped the company's facilities for handling it, and forced the directors, while the campaign was still in progress, to authorize the expenditure of a quarter of a million dollars for the immediate building of a complete new plant.

That plant has since been constructed, and with its fireproof building of steel and concrete block construction, equipped with steam turbo-generators of the newest design, and having an ultimate capacity sufficient to supply electricity for the needs of a city of twice the present size of Roanoke, is one of the finest electrical generating stations to be found anywhere in the South.

Another notably successful publicity campaign was that conducted for the Scranton Gas and Water Company, of Scranton, Pa., one year ago. Early in the winter of 1906-7 Scranton suffered

A SAMPLE OF THE CAMPAIGN ADVERTISEMENT.

me why I didn't jump on the street railway. Everything that went wrong was blamed on the street railway, and people kept telling me I ought to jump on it for this, that and the other thing. But they're letting up since you began these Talks. Yes, sir, the kicks have been dropping off gradually; last week I only had three or four kicks, and for the first five days of this week I haven't had a single person ask me why I don't jump on the street railway."

one of the severest typhoid epidemics in the history of Pennsylvania—a State which has had more than its share of that dread scourge. While the death rate was not high in Scranton, the majority of cases being of a comparatively mild form, there were more than one thousand cases of the vile disease—a truly alarming state of affairs in a city of 100,000 people. The primary source of infection was never discovered, in spite of the most searching investigations by both the local and State boards of health, but it was believed that in some unexplained way a part of the water supply had become contaminated. This water supply was controlled absolutely by the Scranton Gas and Water Company, which forthwith received all blame for the epidemic. A more or less sensational press stirred up a tremendous agitation against the company, and the affair was taken up by some of the weekly publications with “muckraking” proclivities and exploited as a scandal of almost national importance and extent. The active head of the company was pictured thruout the land as the typical arch-fiend among corporation tyrants and “the poisoner of a city.” The members of his family began to fear for his safety. It availed nothing in the public estimation that the company had been prompt to shut off that part of the water supply which had been brought under suspicion, and had been zealous in co-operation with the public health authorities both in the work of investigation and for the abatement of all possible sources of danger.

By adhering to the old-fashioned policy of silence, even of secrecy, until the turmoil of charges and incrimination and scandal became unbearable, the company made things much worse for itself than they would have been otherwise and only increased the popular feeling of antagonism and disgust. And when a statement of some kind from the company became imperatively necessary, it was made so grudgingly and so blunderingly as to fail utterly of accomplishing any desired result.

To be sure, the Scranton Gas and Water Company was not wholly blameless. It had left undone many things which it should have done, and its attitude toward the public and the city government had

long been one that bordered too closely on arrogance. But it did not deserve the wholesale condemnation it received, or the unswerving hostility of practically the whole community, with which it found itself encompassed about before the typhoid epidemic has been stamped out. To say that it had deliberately poisoned the city was the grossest of libels. Yet that was said and thousands of people believed it to be true.

Two months after the epidemic had been brought under control, but when as yet there had been no abatement of the feeling of hostility and public prejudice against the company, and when its officers were at their wits' ends to know what to do to retrieve its lost position and rehabilitate it in the public esteem they were prevailed upon to reverse their former policy and try the efficacy of a publicity campaign. This was looked upon as sort of a last resort; they were willing to undertake it as soon as convinced that it would not do the company any harm. It was undertaken with many doubts and misgivings, for they could not be convinced that anything they could do would be productive of immediate good.

But it did stem the tide of enmity at once; and inside of two months had made for the company such a host of friends as its officers had not dreamed would be possible. A series of forty plain, straightforward talks to the people was printed in each of the four daily newspapers of Scranton, a different “talk” each day, and each one published over the signature of the president of the company; each one appearing for just what it was—a paid advertisement. In these talks “About Scranton Water” the company's side was set forth plainly, fairly and honestly. The facts about the company and its business and its work in the community were given; and they were given without distortion.

The first result was a chorus of commendation for the company for its adoption of publicity. Newspapers and individuals alike let it be known that they were willing to be convinced that the company was not so black as it had been painted. The campaign did enlighten the public on the policy and the motives and the workings of the company, and with better understanding came better feeling.

The final result was a re-establishment of public confidence in that public service company.

The foregoing are only two examples of what has been accomplished by publicity campaigning. Half a dozen others equally successful might be detailed did space permit.

While it is true that too many American corporations have been exploited by unscrupulous financiers, it is also true that they do not all deserve this bad reputation. Fortunately for the stability of American institutions, not all public utility companies are piratical craft; in-

deed, the majority of them probably have tried to do an honest business and to deal fairly with the public. But unfortunately for the honest company, the misdeeds of the dishonest financier have poisoned the public mind against all alike. According to the superficial thinking of the man in the street these public service corporations are all in the same class.

The best antidote for that poison—the best remedy for the company that finds itself under the ban of popular prejudice—is full and honest publicity.

NEW YORK CITY.

Hospitality

BY CLARA I. BREWER

THE most famous man of his age, in his long Oriental journeys, used to pass the home of a "great woman." "And as oft as he passed by he turned in thither to eat bread. And she said to her husband, 'Let us make a little chamber on the wall, and let us set for him there a bed and a table and a stool and a candlestick.'" When this was done, the illustrious guest "turned into the chamber," to the delight of the generous hosts. In return, the good man showed the warmest appreciation of their hospitality, making no complaint as to the smallness of the room or the scantiness of the furniture.

In our own day we have witnessed the passing of that delightful phase of the old-time family life, called hospitality. Perhaps many have been all unmindful of its departure, but some familiar, elusive flavor of life seems lacking. The smack of something hearty and wholesome and satisfying is gone.

Hospitality has given place to entertaining, which is a vastly different thing. Hospitality is a perpetual charm of a genial home. Entertaining is an event—an occasional opening and decking the house for a function—then a lapse into family solitude. Entertaining is like an electric illumination turned on for a brief space and then turned off. Hospi-

tility is a kindly star shining with steady beam.

One cause of the decline of hospitality arises from the efforts of many misguided folk to transplant it from its natural habitat to the unfriendly soil of a club. "My husband belongs to two clubs and my son to three," said a woman recently, "and we do not have any company at our house any more. We invite them to a club instead—it is so much less bother." It may be less bother; the club may possess a score of advantages in appointments and service and cuisine; but it must always come far short in one particular, which to right-minded people outweighs them all—it is not a *home*.

One charm of hospitality is that it dares to be delightfully spontaneous, even haphazard. Some one is picked up and brought home to dinner; or called by telephone Sunday night and urged to come for muffins and new maple syrup; or the neighbors are summoned by the message that the wood fire is just at the stage for popping corn. The person who is afraid to be unconventional will never taste the sweetest joys of hospitality. I have often asked people to come to breakfast for sausage and buckwheat cakes, and no one has ever refused.

Where true hospitality exists every

one is at ease and therefore at his best. The timid find their tongues and talk. Under the spell of the genial atmosphere they even venture to be witty. "When I am at the Davenports'," said the little mousy woman in gray, "I am a surprise to myself. I can talk so easily and can always think of a reply, or an apt story. I come away so satisfied with myself, feeling I am really clever." In the practice of successful hospitality people are judiciously let alone. Most women fuss over their guests too much. If they choose to talk, well; if they prefer to be silent, pray do not force them to talk. If they want to depart, allow them to go without those insistent efforts to detain which many think a manifestation of hospitality, but which are really a great bore, akin to the perils of blockade-running in the Civil War.

One formidable obstacle in the way of exercising hospitality arises from a false notion that things are necessary; things to eat, things to look at—carpets, furniture, silver, glass. "I can't invite any one until I get a new dining room rug." "Our parlor chairs are too shabby to have any company." "I'd like to ask them, but I am not strong enough to get up a big dinner." Hospitality not only does not depend upon these things, but it is something far removed from them. Indeed, its finest flavor is often found amid the plainest surroundings, since they who have beautiful homes may be filled with a pride of possession utterly incompatible with true hospitality.

If one desires to make hospitality famous, it is not necessary to plan elaborate menus or conjure up novel dishes. When people are away from the madding crowd, where they dare to be honest and natural, the majority will confess to a fondness for plain, hearty food. You know that dainty little Miss Spirituelle, who looks as if she fed on butterflies' wings and humming-birds' tongues. Most women bring on a nervous headache when they are to entertain her by trying to think up some dainty to tempt her manifestly delicate appetite. Would you guess that when I want to bring her to our house I have only to telephone that we shall have beefsteak smothered in onions? And did you know that when Blank was a member of a not remote

Cabinet, he would sometimes say to an old friend who lived in a little box of a house on And-so-forth street: "Harry, if your wife can have a boiled dinner to-morrow night I'd like to come out. I haven't had anything good to eat since I was at your house last." If you are a woman longing to make your home a popular place and not knowing quite how to do it, can you not, by dint of patience and intelligent effort, learn to make some one thing so well as to create a reputation for it? It does not matter in the least what it is—chicken pie, or gingerbread, or baked beans, or corned-beef hash. Any woman can so absolutely master one thing that people will say, "If you ever get an invitation to eat Mrs. Baltimore's fried oysters, don't let such a trifle as a previous engagement prevent you from accepting." This phase of the matter has been dwelt upon, not because the pleasures of the table form the chief element of successful hospitality, but because, tho a woman may put forth many other objections, her reluctance to establish a gracious open-door policy arises mainly from wrong notions and absurd standards as to what she will give her guests to eat. If some women could get an illumination on this one point, you and I would be forthwith invited to some houses that are now cloisters.

Would you learn another secret of the witchery of hospitality? It is an open fire. Oh, that miserable dead fireplace of yours, choked with a degradation of papers and rags to keep out the dust! Did not a woman tell me, unblushingly, the other day, that in the twenty-five years she had lived in her house she had never had a fire in her parlor grate? Open it up, I beg you; buy a cord of wood or a ton of cannel coal, even if you have to go without new curtains. When your guests bask in the glories of the fire they will have no time to look at curtain stuff. But will not a gas-log do as well? you ask. There you show the densest ignorance. Can you not see that one of the chief joys of an open fire is the chance to poke it? Oh, the rapture of turning the log over and seeing the swarm of fireflies dance up the chimney! Away with your burlesque, cast-iron makeshift! At our home, when we wish

to prove to a guest that he is admitted into the inner circle of the family life, he is told that he may poke the fire whenever he chooses. At first he handles the poker gingerly, and gives awkward little jabs at the fire. Poor soul, he does not know any better. He was brought up in the society of steam pipes. But soon the joy of poking steals over him; he loses his self-consciousness—then becomes easy and confident—next grows scientific—and ends by arrogantly instructing the Lord of the Hearth: "Pshaw, that isn't the way. Let me show you how to poke a fire." Take my word for it, people will travel miles across a city at the risk of life and limb, lured by the magic of a blazing hearth.

Another necessity for true hospitality is a happy home. Family skeletons have such an unpleasant habit of not staying decently shut up in their closets. They will peer out thru a crack in the door or will boldly sally forth and stalk thru the rooms. Guests are not deceived by mere pretense of happiness. The most stupid person can tell whether love reigns in the home or not. Husbands and wives at variance with each other, or coolly indifferent, may entertain elaborately and successfully, but true hospitality is only found in a happy home.

Hospitality is entirely disinterested. It keeps no ledger, it enters no daily debits and credits. It does not coolly compute its profits. Hospitality does not weigh its guests by the world's faulty scales, but asserts its right to enjoy friends for their worth, or congeniality of taste, or learning, or wit, or even their oddities, quite apart from any consideration of their garments, or gold, or lineage, or luck.

But they who wish to taste the sweetest bliss of hospitality will go a step farther. They will ask, "How may this home of ours, so full of love, so warm with happiness, become a ministry to others? May it not be a place where sad folk are surprised to discover themselves happy once more, where lonely ones find comradeship, and where the discouraged are stimulated to fresh endeavor?" Surely one would covet such ministry for his home, and would rejoice if any one would say, "I could not have lived thru those hard days if your home had not been so freely open to me." It does not take much imagination to see how, in a hospitable home, the "prophet's room" principle might be put to beautiful service. Think of a convalescent, weary with the monotony of her unfavorable surroundings, brought here for more rapid recovery; or of a faithful mother with such exhausting home cares that it is heaven to slip away for just twenty-four hours to a quiet place where she can lie in bed all morning and luxuriate in not thinking of a blessed thing; or of some little clerk who cannot have a vacation, given the pleasure of a week's change of room and fare, with the diversion of a new route to her work; or of a country parson invited to the city for a fortnight to "freshen up" by hearing the great preachers and studying new methods.

It would be well if young people who are just establishing a home would consider seriously what kind it shall be. If it be their good fortune to be of one mind in longing to exercise hospitality of the highest type, let them study the homes that most closely approach their ideal, if haply they may catch the secret.

CLEVELAND, OHIO.

Panama, Central America and Mexico

BY JOHN BARRETT

[This is the fifth of our series of six articles on Latin America by the distinguished and energetic Director of the International Bureau of American Republics. The first was devoted to Brazil, the second to Argentina, Uruguay and Paraguay, the third to Chile, Bolivia and Peru and the fourth to Ecuador, Colombia and Venezuela. Next month's article will deal with the West Indies. The purpose of this series is to bring us into closer sympathy and association with these republics.—EDITOR.]

IN studying Latin America, a good example of material progress can be found in that portion of it north of the Isthmus, at our very doors, comprehended within the republics of Panama, Central America and Mexico.

Only ten years ago Panama was a state of the republic of Colombia. It had lived thru the excitement of the gold fever of '49, it had seen the French Canal Company come and go, and had feared that the promises of the second half of the century were to end in nothing.

Central America, composed of the five republics of Costa Rica, Nicaragua, Honduras, Salvador and Guatemala, had to some extent felt the awakening of the modern industrial life; Costa Rica had already built and opened to traffic the railroad connecting its principal Caribbean port, Limon, with the capital, San Jose, and had projected the line westward from that capital to the Pacific. The enormous expansion of the fruit industry had not been considered, and coffee for export, with agriculture and manufacturing for local markets, were the marks of the industry and thrift of the people there. Nicaragua had abandoned her hopes of providing the inter-oceanic highway, and altho her splendid resources were becoming known, she had not recovered sufficient initiative to plunge with energy into the new century. Honduras, with abundant mineral and agricultural wealth, was also dormant. Salvador, separated from the waves of foreign activity by its isolated position altogether on the Pacific Ocean, was content to develop in the manner characteristic of countries off the beaten paths of travel. Guatemala was beginning to be active; a railway had been for some years in successful operation between the capital and the west coast,

but toward the east the same primitive paths of the natives offered the only outlet to larger markets and a brisker communication with the United States. In Mexico only had the step into the livelier companionship of the modern world been fully taken.

But before showing in detail the advance that has been made here, it will be wise to examine these countries in regard to their geography and physical details. Here are seven republics: Panama, the youngest; Salvador, the smallest; Costa Rica, Nicaragua, Honduras, Guatemala, and Mexico, the largest among the great division of Latin America in the northern continent. They have much in common, but they also have differences which give to each its own individuality.

Panama is by no means so small as is supposed, nor is the Canal by any means all that is implied in the possibilities of that country. In area the republic measures 33,800 square miles, about the same size as the State of Maine. It possesses a surprising diversity of climate and landscape, with a fertility of soil and variety of product. At the center, where the passage from ocean to ocean is to be built, the land is only hilly, but toward the east there are mountain ridges and plateaus suggestive of the towering Andes further south, while toward the west the spurs of the Central American Cordilleras form a natural dividing line between the Pacific and Atlantic drainage slopes. Among the peaks of Darien are mines of the precious metals which have been worked for centuries; but the natural forest and agricultural resources of the country are the real riches of the republic. Omitting from consideration the Canal Zone, which is at present artificially congested, the country is sparsely inhabited, and much of the land has

never been touched or even explored. The old settlements around Portobello still retain the tradition of their once renowned activity; the mysterious race of the San Blas Indians promises to maintain its isolated independence for years to come; the region around David is a cherished center of Panamanian nationality, but the remainder of the republic is virgin soil, open to and welcoming colonization from the rest of the world. It should be added that the land laws of

at the same time. The more thickly settled and cultivated regions of the republic are in the elevated portions, and since the earliest days this favored country has been occupied by thrifty, industrious and productive people, worthy of high regard and consideration. It is a warrantable boast of Costa Rica that they have more schoolhouses than soldiers. Coffee has been the natural staple of the soil, but of late years fruits, especially bananas, have proven a remark-

THE TRAVEL VOLCANO, COSTA RICA.

THE TRAVEL VOLCANO, COSTA RICA. It has an altitude of 12,000 feet and from its summit there is a view of the Atlantic and Pacific Oceans. At the foot of Irazu is the important city of Cartago, the late capital of the Republic, and now the seat of the newly established Central American Court of Justice.

Panama are modern, impartially devised and well administered.

West from Panamá lies Costa Rica. Its area is 23,000 square miles, equal to West Virginia. Here the mountains rise higher above the sea, and the climate is therefore tempered by altitude into a perpetual spring. Costa Rica has one unique distinction in all Central America; from the apex of Irazu it is possible, on a clear day, to see both oceans

able source of wealth and revenue to the republic.

Nicaragua is north of Costa Rica. Its one natural advantage, the relatively easy highway, by way of the river and interior lake, from Atlantic to Pacific, has perhaps been an actual obstacle to immediate progress, because the hope based upon its development was great, and the disappointment in the decision in favor of Panama was correspondingly

keen. Nevertheless, Nicaragua has not stood still. The area of the republic is 49,200 square miles, the size of New York, but the population is only ten to the square mile, showing how much land is in need of labor of some kind to show what its productive capacity really is. In this republic the mountains begin to approach closer to the western side of the continent, leaving on the Atlantic side a wider stretch of land, with a more gradual ascent to the higher and therefore more thickly populated areas. In consequence, progress has been confined chiefly to the region of the great Nicaraguan Lake, the approach to which has been difficult and tedious from the ports on the Caribbean Sea, but easy and more pleasantly accomplished from the better ports on the Pacific Ocean. The result has been to retard the natural intercourse with the neighboring regions on the Gulf of Mexico, and to restrict their communication principally by way of the Pacific either across the Isthmus of Panama or by the extraordinarily long voyage around the Horn to Europe. The civilization of Nicaragua is to be found, therefore, within relatively a few miles of the Pacific, where are the larger cities—Leon, Managua and Granada.

Honduras, the next republic north of Nicaragua, extends also from ocean to ocean. Its area is 46,250 square miles, about that of Mississippi. The same rule applies here that between the eastern coast and the higher mountain levels is an immense region of forest and plateau, hitherto almost untraveled, and that only on the western slope, toward the Pacific, has civilization made decided progress. The rich gold deposits of the country, the vast forests of mahogany and other precious woods, the well watered tracts suitable for rubber and cacao, are open for exploitation, and the markets of the world will soon be demanding the products of such fertile regions as these.

Salvador, lying altogether between the mountains and the ocean, is the only Central American republic with none of its territory touching the Atlantic. Its area, the smallest of Latin America, is 7,225 square miles, about the size of Massachusetts, yet as a political entity it is the most thickly populated of all the

western hemisphere, having a density of 139 to the square mile. The people are energetic and ambitious, and their consuming power is commendably great.

Guatemala is north of Salvador, and borders on Mexico. Its area is 48,290 square miles, comparable to Louisiana. Like Honduras and Nicaragua, it has a long eastern slope from the mountains toward the Caribbean, but there is this advantage, that the indentation of the Gulf of Honduras makes the overland distance to the more thickly settled region of the republic noticeably less, and therefore it has been possible to overcome more quickly the obstacles of Nature, and thus to establish rapid and regular communication between the temperate regions and the ports of the United States and Europe. In the central and northern portions of Guatemala are the wonderful ruins left by the pre-Colombian Indians, and their influences are today evident in certain phases of the present civilization. The modern development of industrial life has been more substantial near the Pacific, and here are the large cities, like Guatemala City, Quetzaltenango and Coban. In this locality, so favored by Nature with a delicious climate and fertile soil, are the famous coffee plantations which have brought so much wealth to the country. But the natural riches are by no means confined to this neighborhood, and the progressive reclamation of the entire eastern section of the country is a marvelous record of man's energy to one who understands and appreciates the events of the last few years.

Mexico, north of Guatemala, is our direct neighbor across the Rio Grande. Its area is 767,060 square miles, making the country as large as all the region in the United States east of the Mississippi less New England. It is third in size of the republics of Latin America. Little need be said here of the magnificent progress made by Mexico even within the last decade. Every year more Americans travel thither, and therefore an encouraging appreciation of the republic's beauty and activity is rapidly becoming better recognized. It may be explained, however, that the interior of the country is a lofty plateau between the peaks of the mountain chain continuous with the

PALACIO NACIONAL, MANAGUA, NICARAGUA.

Rocky Mountains in the United States. On this table land civilization and industry have made most noticeable advances; Nature has been bountiful with gold, silver, copper and other minerals, but climate and soil have combined to make Mexico one of the great producers of staples, like coffee, corn, beans, cotton and cattle. In this region almost all of the crops of the temperate zone are grown, while near the coast can be found the more essential products of the tropics, like the sisal fiber, fruits, rubber, cacao and mahogany. The splendid cities of Mexico date from Spanish times, but they all have been modernized and many equally fine ones have been added within the last few years, since the republic decided to extend its foreign commerce, and to exchange what it produced for what its people as consumers needed at home to equip them for the industrial life of the century.

In fact, the explanation of the unmistakable advance taking place in all the republics north of the Isthmus since the beginning of the century is their deter-

mination to develop their own natural resources and to sell them abroad for those material blessings which would aid their people in their desire for physical, moral and educational improvement. How well this is being accomplished can be seen by continuing the comparison begun in the opening paragraph of this article.

At the beginning of this century, ten years ago, it was impossible to reach any of the Gulf or Caribbean ports by regular, first-class steamers from ports in the United States. The Panama Railroad had a good service from New York, and freight vessels touched at Vera Cruz from New Orleans and New York, but travel in this way was neither comfortable nor expeditious. On the Pacific side conditions were somewhat better, for the route of travel established during the excitement of the gold days of California is still maintained regularly. Today conditions are remarkably different; from New York, New Orleans and other United States ports it is now possible to take comfortable, first-

class passenger steamers, with arrivals and departures adjusted to systematic schedules, for practically all the Atlantic ports of Panama, Central America and Mexico, while over these steamship lines passenger travel and freight traffic is as great in one week as they were in one month when only tramp vessels were available. The distance from New Orleans to Port Limon, in Costa Rica, is only 1,287 miles, once a tedious seven days' travel, while now the same trip is made in five days. To Puerto Barrios it is only 950 miles, a trip of but four days. To Vera Cruz, 790 miles, only three or four days. All these countries are thus brought remarkably nearer by the sea voyage, but other means of travel and transportation have contributed to make more accessible and therefore more neighborly these republics in the North American Continent. Railroad construction has made wonderful advances within these past ten years. Mexico has

built and completed a splendid transcontinental line from Puerto Mexico, on the Gulf, to Salina Cruz, on the Pacific, a distance of only 190 miles, thereby shortening to a considerable degree the distance between New York and the Hawaiian Islands or Australasia. In addition to numerous other lines in the interior, the republic has completed also another transcontinental connection between Vera Cruz and Manzanillo, thru the ancient city of Colima. Guatemala, meanwhile, has accomplished the fine engineering feat of uniting the Atlantic with the Pacific by the railway from the capital, Guatemala City, to Puerto Barrios. In both Honduras and Nicaragua concessions have recently been granted for railways from the eastern coast to the capitals. Costa Rica has practically completed its own interoceanic railway, which will thus afford another easy passage between the two oceans. Thus there are, south of the Rio Grande, be-

THE CART ROAD.
From Tegucigalpa to Camaguela, Honduras.

sides the long-established Panama Railroad, four lines of rails connecting the Atlantic and Pacific, all completed within the first ten years of this century. They offer highways between the East and the West, and make the journey noticeably shorter to many sections of Central America and Mexico. During the same time, the regular steamship service has increased to ten lines to and from ports in the United States, and well-known European companies have arranged for closer communication with

bors are, as it were, today only a step across the border. The telegraph has been noticeably well extended, and there is hardly a spot with a permanent settlement in these seven republics which cannot be reached by speedy, accurate and dependable telegraph messages. Even the wireless has been called into service, and at least six commercial, with several Government stations are now regularly established between Panama and Yucatan; these connect with stations in Jamaica and at Cape San Antonio, at the

CENTRAL STATION, CONCEPCION, GUATEMALA

the active trade centers on the Gulf of Mexico and the Caribbean Sea. On the Pacific, closer connection is increasing with the Orient, and even as this is written comes an announcement of a new steamer service just inaugurated along the entire west coast, from Seattle to Panama. The Pan American Railway, too, once the dream of the past, is so nearly an accomplishment that today the traveler can go on dry land almost to the capital of Guatemala, and practical plans are on foot to pierce Salvador to Costa Rica. Other ties have been proportionately strengthened, so that these neigh-

extreme western point of Cuba, so that messages can thus be sent from the Isthmus to every republic in the continent.

There remain to mention only the cities, many of which will appear astonishingly fresh and modern to those who for the first time visit them. San Jose, in Costa Rica; Tegucigalpa, in Honduras; Leon and Managua, in Nicaragua; San Salvador, in Salvador, and Guatemala City, in Guatemala, are all attractive, progressive and ambitious: they have electric lights, good car service, fine public buildings, many elegant pri-

vate residences, and a society in which any one ought to find congenial surroundings. In all, the educational facilities are improving constantly, while each Government maintains in its capital institutions of higher learning, where excellent training in the professions is offered. Mexico is omitted from this list, because its cities are well known in the United States, and a mere enumeration of them would consume too much space.

The climate thruout the greater extent of these republics is, contrary to the usual tradition, healthful and even invigorating. Along the coast, to be sure, from Tampico or Vera Cruz, thru the Mosquito Territory to Limon and beyond, it is hot, moist and unvarying, but even here the terrors of the tropics are dissolved by the magical triumphs of twentieth century science. By taking proper precautions against infection, life is relatively as safe as it is in the rigors of a Northern winter, and the easy access above referred to robs the tropics of all its early terrors. On the mountains or the plateaus, on the other hand, protection is needed quite as much against the cold as against the heat, for the altitude of the more thickly populated areas is seldom less than 2,500 feet, and this implies a climate about equal to that of the southern portion of the United States.

Attention should be called to the encouraging growth of the foreign commerce during the last decade, for which exact figures are available. Central America has increased its total commerce from \$42,000,000 in 1897 to \$58,000,000 in 1907, and that of Mexico has gone forward in even a greater degree. This commerce with the United States is still more encouraging, the proportion of increase being relatively greater. To this end the better facilities of intercourse mentioned contribute noticeably, but whether they be cause or effect need not excite discussion, because in every sense they point undeniably to the larger opportunity the United States now enjoys in this portion of Latin America.

Opportunity does not mean reckless abandonment of position or occupation at home for the sake of indefinite for-

tune hunting abroad. Those who seek work alone, or who have not the means for careful and deliberate study of industrial conditions abroad, must not imagine that Mexico, or Central America, or Panama are calling them to affluence without the possibility of misadventure. These republics have no need of fortune hunters. They do need, however, both labor and capital to help them exploit their wonderful natural resources. Labor can be supplied to some extent by the native class already actively employed, and for many generations past, on the soil. That there are not enough of them is but repeating the lessons learned by the United States in building the Canal, but only by the gradual introduction of workers of some kin to them, or by so nourishing them in body and mind that they become sturdier and more able to assume the greater demands of modern industrial life, can the necessary toil be accomplished. Let it be taken for granted, therefore, that the Anglo-Saxon cannot enter the ranks as a day or field laborer in competition with the native.

It is different, on the other hand, when there comes up for consideration the opportunity for those above the laboring class. Yet this, too, must be applied only to those who have a firm desire to settle, to make a home, and to incorporate themselves with the people, the same as Germans become part of the civilization to which they migrate. There is no necessity to change one's nationality, but to adapt one's self to a new home, is the keynote to success. The first question to be asked will be about the land. There is plenty of good land, from the Rio Grande to the Canal Zone, available for the most profitable farming, in a beautiful country, with a climate that should have no terrors for the healthy and even some solaces for the weak. This land is nowadays within comparatively easy reach of every country under the sun, and, what is equally of moment, the produce from it can be sent with no extravagant cost to the consuming markets of the world. But just as there would be no excuse for the purchase of land in the United States without carefully inspecting it and all the conditions surrounding it, so the

intending settler in Mexico, Central America or Panama must use the same judgment in buying land there.

In the positions which can be filled only by skilled and trained individuals the same proposition will apply. Railway operators, mechanics, clerks, stenographers, teachers in specialties and professional graduates are wanted and welcomed, but only those who are invited to come, or who have secured employment under proper conditions beforehand, or who have made a trip of

Finally, in a more material and yet a very commendable sense, opportunity is offered to the merchant who will send his advance agents into Mexico and Central America to extend his trade. United States business men do not realize what splendid markets these newer consuming peoples afford; they must be investigated carefully, but the reward is sure if the same energy is applied there as characterizes their invasion of the growing markets of the West and South. The same is true of the larger

STREET SCENE IN THE CITY OF MEXICO

personal investigation, are capable of a successful career. Work is as arduous in Latin America as elsewhere. In the line of intellectual study and investigation opportunity is unlimited. Ethnic and philologic problems are awaiting solution; questions of race, climate, soils, food supply, of social requirements, the fauna and flora of tropic and sub-tropic regions, and the innumerable problems of scientific and intellectual life can be studied with most abundant material, right here in Latin America.

activities in which the capitalist and financier are interested. There are railroads to be built, construction work of all kinds to be done, modern improvements of all kinds to be introduced. The potentialities for the investment of capital are almost unlimited. Young men of wealth, ambition and energy should think of these things, rid themselves of the idea of remoteness, and determine to be active participants in the great progress so characteristic of the modern world.

WASHINGTON, D. C.

Church Federation for Industrial Neighborhoods

BY ALBERT J. KENNEDY

[Our readers will remember a former article of Mr. Kennedy's published in our issue of April 9, 1908, entitled "Religious Overlapping." The author is a resident of South End House, Boston's leading settlement.—EDITOR.]

THERE are no districts wherein the waste and inefficiency of denominational overlapping show with more startling distinctness than in the industrial neighborhoods* of our great cities. The two neighborhood situations described below are typical and could be multiplied many times over.

The first quarter was at one time a well-to-do residential portion of the city. The movement of industry swept away its householders, and their dwellings were converted into tenements. Altho the population is now largely Catholic, the half dozen Protestant churches continue to hold services. No one of them is ever more than a quarter utilized; all are largely supported from without the district; each refuses any co-operation with the others. The buildings have taken on the run down and discouraged aspect of the neighborhood, and in several instances the interior roof and walls have become water stained and musty. The services lack color, inspiration, joyousness. The clergy are receiving salaries too low for efficiency; and while evangelically enthusiastic, lack that training in general social endeavor which would make their services valuable in forcing up the social and civic life of the neighborhood.

The second neighborhood is a great tenement district thrown together by speculative builders within the last fifteen years. There are enough Protestants within a half mile radius to form a strong church. But they are of differing denominations, and the neighborhood goes unserved except for the Salvation Army.

Three things are necessary to bring about an improvement over such conditions, viz.: An awakening to the reality of the Church's spiritual mission; a broadening of the ecclesiastical concept of brotherhood; some form of Church unity, based on the only vital principle of unity: the need of the district to be served.

The social mission of the Church is to interpret men to themselves as individuals, neighbors, citizens and worshippers, which mission demands that it enter into the entire spiritual problem of those it would serve. This service is especially needed whenever new knowledge makes necessary new interpretations of life and duty, or unusual conditions impose extraordinary difficulties to righteous living. When the Church demonstrates a hitherto neglected factor in disease, it ought to provide for the extensive dissemination of such knowledge. If it finds itself better able to cope with the spiritual difficulties of a social disease like tuberculosis thru a social method, it does well to form a class for that purpose. When a church would serve a constituency living under unusual or abnormal conditions, it must adapt its ministry to their needs. In doing this it may have to reassume types of spiritual activity which the great body of the Church has long since passed over to secular agencies; or, if necessary, originate altogether new forms of primary spiritual expression.

It is at this point that the claim of the industrial neighborhood comes before the Church. Such a district furnishes spiritual backgrounds which the Church cannot neglect. It must be interested in the economic conditions of men to the point of offering them an opportunity to find their souls. Men who need the pri-

*By Industrial Neighborhoods are meant those portions of the city inhabited by families of laborers, mechanics and low grade clerks, whose average income is between \$9 and \$15 a week. Persons within that wage scale make up the major portion of the modern city.

federation have considered country conditions, but the principle of responsibility for limited neighborhoods applies with even greater force to the city. The neighborhood is the prime, self-sufficient social unit. It is the universe of the children; within it they live and grow and have their being. Home, school, play, companionship and adventure exist within its narrow borders. Women naturally tend to live within bounds. They do a large share of their shopping in its small stores, and find their friends largely up and down its streets. Neighbors come to know each others' comings and goings, wants and troubles, difficulties and faiths. Here in this prime social unit is the opportunity of the Church. A clergyman, if he is a man, can enter into and comprehend its life. He can in time know its streets, its housing, its sanitary needs, its people, races, tendencies, habits. He can know its schools and teachers, its opportunities for social relationships, for amusements, for vocation. He can understand the work of the men, their politics, their thinking and their ideals. He can sum the life of that district; he can impart fresh impulse into it, and stimulate its native resources.

But in order to secure this kind of service the man must be responsible for the neighborhood. He must have a recognized right and place within its borders in order that he be keenly alive to its spiritual welfare. He must get its pulse and become responsive to its ever-varying moods. Its people, old and young, must become bone of his bone and flesh of his flesh. And he will lay at their service all his knowledge of human life, together with the resources of the Church and the community behind him. The new knowledge which others obtain from specialists he will distribute by word of mouth. For his neighborhood he can command service that no individual can obtain, and the Church would be the center and font of spiritual inspiration.

For religion, like all other commodities, needs to be properly distributed. One of the results of playground experience has been to demonstrate the need of small areas easily accessible to each city neighborhood. The big grounds are

generally too far away to be within reach. A recognized neighborhood church would allow opportunity for the accessibility that is the very heart of intensive work of any kind. Its rooms for social and cultural opportunity would make it possible for the wage earner to find recreation at once suitable to his needs and close at hand.

Let us apply our criteria of enlarged spiritual work and neighborhood responsibility and see what would result.

It would force the denominations to some adequate statemanship. Each church would be assigned a definite place and would set about supplying community needs. It could be well enough organized and sufficiently sure of tenure to be frankly opportunistic.

Further, this kind of intensive work would tend to eliminate the denominational expert and to bring forth the humanized minister. It would call forth the man of vision and accomplishment, and give him his opportunity for definite, real, telling work.

Such federation would remove the present strain of interdenominational competition. There are churches in industrial quarters where the clergyman is first of all a financier who is afraid of any form of church unity or civic action that might make his task harder. "I am driven to the last notch to make this church go, and I won't go into anything that might even remotely affect its audiences," was the reply to a request for co-operation in a civic cause. The church competition in certain districts, and the materialistic schemes used to attract certain classes of membership are notorious.

Federation would mean increased efficiency on a lower per capita basis. The cost of membership in our industrial churches is too high. Few such churches can live from their membership fees; most of them are heavily subsidized by mission societies or individuals. A church of fair size ought to be able to pay its own costs of maintenance. There are Catholic churches which run their plant, together with an expensive educational system, on an adult per capita weekly contribution of 10 cents. Adequate enlargement of membership would permit the beautifying of the building.

the enrichment of the service, the employment of a good speaker, the stimulating effect of good-sized congregations vitally interested in their place and problems.

A recognized neighborhood church would do away with a great deal of church delinquency. Under the present system one great excuse for not attending service is the absence of the sect in the neighborhood. Consequently the family gives up church connections. The interdenominational church would offer services close at hand and at hours to suit the community. There would be no excuse for children going elsewhere.

Not the least advantage of such a plan would be the resident clergyman, known to every one and always at hand. No one knows how much good an accessible

clergyman whose residence was a matter of common knowledge could do. Without doubt there are many hard-driven souls who would turn to such a one for comfort and strength. There is nothing that is undermining the Church today like the lack of constant personal contact between clergy and people. The minister with a parish scattered over ten miles of territory is not likely to know his people as he ought, and they both suffer.

The whole matter is in the hands of the Churches themselves. Most of the things suggested in this outline are already in operation. The next step is to bring the vanguard of Christianity to the better appreciation of their faith, that we may have the resources and the men to set about the fulfillment of the Church's too long neglected task.

BOSTON, MASS.

Leonid Andrejev

BY IVAN LAVRETSKY

TO predict a brilliant future for every young writer whose star suddenly blazes forth in the literary firmament is an old and worn-out method of estimating real merit. The prediction generally is not fulfilled. The promising young author of yesterday in all probability has disappeared today and will have been forgotten by tomorrow. Such, however, cannot be said of Leonid Andrejev, as he has already more than fulfilled the brilliant promises which his earlier work presaged. Not alone is he at present a prophet with honor in his own country, but his literary eminence is also fully acknowledged in Germany, and his fame is now rapidly spreading thruout Continental Europe, England and America, where translations of his works are being published, and where he is known and appreciated by the reading public which likes to keep well abreast of the time.

Leonid Andrejev was born in Orel, Russia, in 1871. His career as an author,

however, only began about ten years ago. At that time he was a poor and struggling young lawyer in Moscow. In order to eke out a sufficient income to keep body and soul together he managed to obtain a position on the staff of the *Moscow Courier*, his duties being to report the daily police court incidents and happenings. It seems that nobody paid any particular attention to the young man, and indeed, his fellow-workers on the staff, even if they were so much as aware of his existence, never deigned to speak to him. One day, however, the *Courier* published a short story of his, entitled "Bolschoi Schlem," which he had handed in. The day following its appearance the editorial department received a telegram from Maxim Gorky, who already was a popular literary idol in Russia, which read as follows: "Who is it who hides himself under the pseudonym Leonid Andrejev?" They telegraphed back the reply, "Leonid Andrejev." It is needless to say that from that

day forward the young author's colleagues on the staff of the *Courier* deigned to know him. Shortly afterward a somewhat similar incident occurred. A tale of Andrejev's was published in a Russian journal called *Life*. The well-known poet and mystic, Dimitri Mereschkowsky, rushed excitedly into the editorial office of *Life* and wanted to know who it was that wrote under the pseudonym Leonid Andrejev—Tschekov or Gorky?

It is indeed not difficult to trace the influence, not alone of Tschekov and Gorky in the earlier works of Andrejev, but also of Tolstoy and Dostoievsky. From Tolstoy he seems to have learned how to see things and how to convey to the reader that which he sees; from Dostoievsky he has learned how to penetrate the hidden recesses of the human soul and to lay bare its secrets, without shame and without fear; from Tschekov, brevity and the power to depict, in a few bold, crisp strokes, the whole drama of human life. As for Gorky, to whom he has been compared more than to any other writer, it is now quite generally conceded that Andrejev is far more gifted than his famous friend and colleague. He has all of Gorky's strength and power of delineation without the latter's bitterness and brutality. To be sure, Andrejev's delineation of sordidness and wretchedness can also at times be terrible in its realism, yet he is, nevertheless, by nature—both in theory and in fact—an artist as well as a poet, and his pessimism is always tinged with a certain idealism. His theme may be human misery and despair, but his treatment ever displays the artistic touch of a master to whom beauty is an objective point as well as truth.

Andrejev himself thinks he is much indebted to Tolstoy—the Tolstoy of yesterday, not of today; to Nietzsche, whose works have been his constant companion for years—he being indeed the first in Russia to translate Nietzsche's "Thus Spake Zarathustra"; to Edgar Allan Poe, and last, but not least, to the Bible. He has more than once utilized to good advantage biblical incidents and characters, especially from the New Testament—such, for instance, as Judas in "Judas Iscariot and the Others," which is one of

his greatest and most striking works, and also in the short story called "Lazarus" (an English translation of which was published a year or so ago in *Current Literature*), where the author tells us what became of Lazarus after having been so miraculously raised from the dead. That Andrejev prizes the Bible very much and lays great stress on its perusal is evidenced by the following extract from a letter to a young writer who had dedicated a new work to him: "I thank you for your kind dedication. Unfortunately, as yet I have not had an opportunity to read your manuscript thru. In glancing over it, however, I note that in one place you write about the Bible. Yes, that is the best teacher of all—the Bible."

Naturally a writer of such originality and power as Leonid Andrejev has had to suffer much from the demands of conventionality. More than once in the beginning of his literary career he received the editorial admonition that he should learn to write less naïvely. Luckily he never followed this advice, therefore his works have ever retained their wonderful freshness and originality.

One of Andrejev's best known works belongs to his earlier period. It is a tale entitled "The Red Laugh," and a more powerful and realistic picture of the horrors of war has never been painted. In "The Abyss"—a tale which created a tremendous amount of controversy and discussion in Russia—he endeavors to show how, under baneful and ugly influences, a thing which was merely a feeling of pure love in the beginning may drag one down to the very lowest depths of degradation in the end. On the first publication of "The Abyss" it called forth an open letter of protest from the Countess Tolstoy, wife of Russia's Grand Old Man, but, as is generally the case in such instances, the Countess's well-meant denunciation only created a greater demand for the work and gave the author a wider popularity.

"In the Mist" is another tale of Andrejev's in which the natural instincts predominate and lead the hero also into an abyss. To be sure, a different motive is here involved, but the result is much the same. Briefly, it is the striving of a

youthful mind, filled with vague misgivings and apprehensions to know the mystery of sex. The lad falls because of his simplicity and inexperience. Thru the whole, however, there is a vein of satire directed against present-day family and social life.

The manner in which Andrejev treated these problems was a new departure in Russian literature. Hitherto ethical, social and political problems had chiefly predominated. In "The Governor" and "The Seven Who Were Hanged" the *leit-motif* is the haunting fear of death. There is a trace of Nietzscheism in "The Story of Sergius Petrovitch," while a strong fatalism envelops "The Life of Father Vasilli," another of Andrejev's tales which has been much read.

Of Andrejev's dramas, of which he has written several, the best known is "To the Stars," which breathes an atmosphere of idealism. The pessimism of the author here disappears entirely, and the lofty aims and struggles of the chief hero lift him far above the general-ity of mankind.

His latest and by all odds the most curious and striking work is a drama called "The Life of Man." The chief hero in this piece in reality is Fate, Man being only the plaything. The drama opens with a prologue in which a vague, shadowy figure shrouded in gray, known as "He," speaks of the Life of Man. From the wall of a vast gray and gloomy chamber, dimly lighted, silently appear One in Gray. He wears a loose, shapeless gray gown that only vaguely shows the outlines of his massive figure. His head is covered with a similar gray cowl, which throws a deep shadow over

the upper part of his face. The eyes are invisible. That which one sees—the cheek bones, the nose and the sharply cut chin—seem as tho chiseled out of gray stone. His lips are pressed firmly together. He raises his head slightly, and begins to speak in a cold, hard voice, devoid of all emotion, like a paid reciter with brutal indifference reading from the Book of Fate. "Behold and hearken, all ye that cometh here for the sake of merriment and laughter. Before ye shall now be unrolled the scroll of Human Life from its dark beginning to its dark

end. He, who till now was not—he who was mysteriously hidden in the infinity of Time, unthought of, unheard of, unknown—will mysteriously break thru the barriers of non-existence and with a cry announce the beginning of his short life. In the darkness of nonentity shall a light blaze forth, lit by an unknown hand—that is the Life of Man. Behold the flame—that is the Life of Man.

"As soon as he is born shall he assume the form and name of Man and become similar to all other

men who live upon the earth. And the cruel fate of all other men shall be his fate, and his cruel fate shall be the fate of all mankind. Constantly dragged forward by unrelenting Time shall he without resistance follow the steps of human life from the bottom to the top, from the ten to the bottom. Limited in his vision, shall he never see the next step which his uncertain feet must take. Limited in knowledge, shall he never know what the coming day, the coming hour, minute, will bring. And in his blind ignorance, tormented by misgivings, swayed by hopes

LEONID ANDREJEV

and fears, shall he obediently travel the circle of his predestination.

"Here is he—a happy youth! Look, how brightly the candle burns! The icy wind of boundless space makes the flame quiver, still it burns brightly and clear. But the candle diminishes, devoured by the heat. But the candle diminishes.

"Here is he—a happy husband and father! But look, how curiously the candle flickers . . . And the wax melts, eaten by the fire—and the wax melts.

"Here is he—a graybeard, sick and feeble! Already are the steps of his life at the end, and a yawning abyss is before him. Still the tottering feet carry him ever forward. The bluish flame, weak and sputtering, quivers and sinks, and silently becomes extinguished.

"Thus shall the man die. Born out of darkness, so shall he unto darkness return, and disappear without a trace in the Infinity of Time, unthought of, unheard of, unknown. And I—whom all call 'He'—I shall remain the faithful companion of Man in all the days of his life. Unseen by him and his, shall I ever be near him, when he wakes and when he sleeps, when he prays and when he curses. In the hours of joy, when his

free and daring spirit soars aloft to the skies; in the hours of trouble and sorrow, when his soul is darkened by deadly torture and the blood in his heart stands still; in the hours of victory and defeat, in the hours of the great struggle with immutable Fate—shall I be with him, shall I be with him.

"And ye, that cometh here for the sake of pastime, behold and hearken! Like a far-off, ghostly echo, the swiftly fleeting Life of Man, with its sorrows and its joys, shall now pass before ye."

The One in Gray ceases. And silently the light is extinguished and darkness embraces him and the empty gray room.

There are five pictures, or acts, to this play. Picture one indicates the Birth of the Man. The speech of the old women concerning the sufferings of the mother and the father's anxiety, as well as the gossip of the neighbors who come to congratulate the parents, reminds one somewhat of Maeterlinck. Picture two indicates Love and Poverty. Picture three, Riches and Affluence. Picture four, Sorrow and Misfortune. And the final picture, of course, is that of Death claiming its own.

The Counter Influence to Woman Suffrage

BY ALICE HILL CHITTENDEN

IN a recently published magazine article on the subject of the woman suffrage propaganda, this challenge was thrown down in an editorial note, "If you don't agree with them (the suffragists) you ought to think of some way of stemming the rising tide in favor of woman suffrage."

Lists of woman suffrage "gains" are published from time to time in our daily papers, but a careful study of these statistics will disclose the fact that during the past decade these "gains" have been made chiefly in countries where monarchical government prevails, while here in our own republic only a few minor woman suffrage measures have been enacted during the same period. On the other hand, a study of some of the recent defeats and checks which woman suffrage has received in this country will not only disprove the theory that the tide is rising in its favor, but will confirm the statement made by so close an observer of social conditions as Mrs. Humphry Ward, who, after her visit here last spring, said: "After half a century of agitation, the woman suffrage movement in the United States is obviously declining, put down by the common sense of the women themselves." What are some of the facts upon which Mrs. Ward based this statement, which is sure to be challenged by those who mistake a campaign of English suffragette methods for an increasing sentiment in favor of granting women the elective franchise?

The vote on this question in the State of Oregon a year ago last June, when compared with the vote there in previous years, furnishes considerable proof of the truth of her assertion. Situated as it is in comparatively close proximity to the four suffrage States—Wyoming, Utah, Colorado and Idaho—the suffragists have continuously claimed that Oregon would soon "fall in line" and

become the fifth star in the suffrage flag. Working with untiring energy, they have succeeded in bringing this question before the voters of that State to vote upon three times in the past eight years, with the following results:

In 1900, a constitutional amendment in favor of woman suffrage having passed the legislature, was submitted to the people at the polls. At that time 28,402 votes were cast against the measure and 26,265 in its favor, there being an unrecorded vote on this particular question of 27,283. The provisions of the act of initiative and referendum, which Oregon adopted soon after that, enabled the suffragists in 1906 to simply file a petition with the Secretary of State for a constitutional amendment without first appealing to the Legislature. In full confidence that this easy method of bringing the question before the people would assure their success, the suffragists waged a vigorous campaign in every county of the State, and sent twelve of their best speakers into the field. The official count showed that 47,075 votes were registered against the amendment, while 36,902 were recorded in favor of it, making a majority of 10,173, or almost five times as large a majority against the question as in the previous election of 1900. Ten counties went on record as being in favor of woman suffrage, while twenty-three opposed it. Disappointed, but not disheartened, the suffragists started in almost immediately on another campaign, and succeeded in bringing this question again before the people to vote upon. The official returns from the election held June 4, 1908, must dispel every shadow of doubt from the minds of the unprejudiced regarding the sentiment which prevails in Oregon on the question of giving the ballot to women, for while the amendment this year polled 36,858 affirmative votes, 58,670 were re-

corded against it, a significant majority of 21,812, while only four counties instead of ten were carried by the suffragists.

These figures when studied as a whole show that over 30,000 more votes were cast against granting the franchise to women in 1908 than were recorded against it in 1900, while in the same length of time, and despite their three campaigns of unceasing vigor, the suffragists only succeeded in increasing the votes in their favor by a little over 10,000. To what counter influence then was this steadily increased sentiment against women suffrage in Oregon due?

Wholly to a campaign of education along the broadest sociological lines, carried on quietly and persistently by a small number of intelligent, clear-visioned women in Oregon, who earnestly believe, with many others of their sex throughout the country, that a sovereign state recognizes the natural law of the differentiation of sex activity when it exempts its women citizens from certain duties which it imposes upon its male citizens, and, furthermore, that this law should not be abrogated merely because a few women desire to add political responsibilities to their already manifold duties.

But Mrs. Ward did not base her statement that woman suffrage is obviously declining in the United States solely on the figures of the three elections in Oregon. She had an array of other facts to prove the truth of her conclusions—facts to which the general public should give heed when they hear it said, that woman suffrage is inevitable and that all opposition to it is futile. What are some of them?

In four States, as has already been stated, women exercise the full power of the elective franchise. The history of how suffrage came to be granted to women in those States is closely interwoven with the development, at one time and another, of various populist doctrines in that section of the country. Woman suffrage existed in Utah and Wyoming in the days when they were still Territories. The suffragists are not very proud of Utah, and do not like to be reminded that the women voters of that State helped to send Mr. Brigham H. Roberts, a Mormon with three wives, to

the House of Representatives in Washington. Every one remembers that Mr. Roberts was not allowed to take his seat, and it was said at the time that the protests against seating him which the Congressmen received from the non-voting women of the other States were largely responsible for his exclusion by a vote of 268 to 50.

The women of Colorado obtained the ballot in 1892 by the small majority of 5,000 out of a vote of 200,000, while in Idaho in 1896 the result was so close it had to be referred to the Supreme Court for decision. Since that date, thirteen years ago, no State has granted either full suffrage or even municipal suffrage to women. In fact, the suffragists can only point to a few measures of minor importance which have been enacted in their favor in any of the forty-six States during this period. Delaware, for instance, had school suffrage to tax-paying women in 1898, and since then Louisiana and New York have granted suffrage to women taxpayers under certain conditions, but in the latter State this only applies in towns and villages. A new clause in Michigan's constitution entitles women who own property to vote upon questions of appropriations, but the proposition to admit women to full suffrage was defeated in the constitutional convention.

If these are the suffrage gains in this country since 1896, what are some of the defeats which the movement has suffered during the same length of time? In the same year in which Idaho, with its small and widely scattered population, became a "suffrage State," the voters of California, the great State of the Pacific Coast, defeated a constitutional amendment for women suffrage. In South Dakota and Washington a similar measure was defeated in 1898. New Hampshire voted against woman suffrage in 1903, and we have seen how the question has been lost three times at the polls in Oregon. Last year the constitutional convention of the new State, Oklahoma, refused to embody in their constitution a provision granting women the ballot.

In addition to these defeats when this question has been taken to the polls, there is the long list of legislative defeats of woman suffrage measures in the sev-

eral States year after year. In 1908 the legislatures of eight States either rejected or defeated such bills, and in 1907 similar bills were defeated in sixteen States.

In twenty-nine States women exercise a more or less limited form of school suffrage, but the indifference of women to this form of voting is evidenced by the following figures: At the legislative hearing on a municipal suffrage bill in the State House at Boston last winter, the facts were brought out, that whereas 700,000 women in Massachusetts were qualified to vote for school committees, the number actually voting thruout the State fell from 18,483 in 1906 to 13,619 in 1907. In 189 towns in Massachusetts in 1907, where 3,068 women were registered as voters, not one woman voted. The Bridgeport (Connecticut) *Farmer* of November 5, 1908, said:

"Despite the prominence of the woman suffrage movement in New York, there was not a single woman who cared to exercise her rights during the last election to vote on the school question in this city. The town clerk provided the necessary ballot boxes and ballots in each district, and after the city had gone to this great expense, not a single member of the fair sex came out to vote."

In Cleveland, Ohio, 6,681 women qualified to vote for school officers in 1904, while three years later, in 1907, only 3,179 registered, showing a decrease of 2,502. A leading paper of that city comments on "the surprising lack of interest shown by women in the school board election." These facts in regard to school suffrage are now so widely known, that within three years five States have refused to grant this form of suffrage to women, and in two States, Ohio and Connecticut, the question of repealing this law has been seriously considered.

Kansas holds a unique position on this question. In 1887 municipal suffrage was granted to the women of that State, but since that time every effort to extend the full franchise to them has failed. Even when it was submitted to the people at the polls to vote upon, a majority of 34,827 was recorded against it. It is our municipal government which is today almost a national disgrace, and the advocates of woman suffrage are prone to argue that a ballot in woman's hands would purify politics. After twenty-one

years of municipal suffrage in Kansas, have women voters there wrought any great changes in the government of its cities? If so, the knowledge of it has not reached the outside world.

These statistics do not furnish much evidence of a rising tide in favor of woman suffrage in the United States, but, on the contrary, show that the movement has received a severe check, and that this check, as Mrs. Ward truly says, has come from the women themselves.

During the past sixty years a swift current of varied forces has swept woman away from the quiet moorings of home and turned her adrift on the turbulent sea of economic independence. During this period colleges and universities have likewise opened their doors to her, and today there is scarcely a recognized profession or trade which does not number women in its ranks. A study of the statute books of any State shows how many laws have been enacted in woman's favor, until now she has many legal privileges to which no man may lay claim. All these movements have developed without any serious opposition, because thoughtful men and women have recognized that they were largely due to natural causes. But the fact that within recent years the agitation in favor of woman suffrage has met with organized opposition at once differentiates it and sets it apart from all the other so-called woman's movements.

There is undeniable magic in the word progress, and the phrase, "When you oppose the extension of suffrage to women you retard woman's progress," appeals to many as an argument in its favor. But progress to be genuine must accord with natural laws, and the demand that woman shall now assume the burden of political responsibility is at distinct variance with two natural laws. First, the essential and intended difference in sex activity, and, secondly, the great law of evolution which teaches that the development of the race has been a continuous growth in specialization. A recent writer has said:

"Either sex is an appalling blunder, or else it must have been intended that each sex should have its own work to do, not merely in the physical economy of the race, but also in the social and intellectual world."

There is no economy in having two people do the same work. This leads to diffusion, or a tendency to weaken the forces, while concentrated effort or specialization strengthens the natural powers.

The open opposition to woman suffrage in the country started in the early nineties, or shortly after the ballot had been given to the women of Colorado. A few thoughtful women in New York, Massachusetts and Illinois began to consider the woman suffrage question seriously and to study some of the sociological principles which it involved. Of what benefit will the ballot be to women themselves, and what possible advantage will accrue to the State by doubling its voting population? These were two of the questions asked, and in 1894, when the constitutional convention met in New York State, an answer to these questions was formulated and placed at the head of the protest against woman suffrage which was sent to the constitutional convention by a committee of Brooklyn women:

"The women who bring this matter to your attention have, from a studious contemplation of governmental principles involved, come to a firm conviction that woman suffrage would be against the best interests of the State, its women and the home."

This is the platform upon which the anti-suffragist in the United States stands today, and in opposing the extension of the suffrage to her sex she is animated by the highest motives of patriotism. The personal element is entirely eliminated from her view of the question. She does not oppose giving the ballot to women, because, as is so often asserted, she herself does not wish to vote, but because she sincerely believes that in the ideal State the duties of man and woman should not be similar, but rather correlated. As these fundamental sociological principles which underlie the woman suffrage question are becoming more widely recognized, the old time semi-chivalrous argument, "If

the women want to vote, we will let them," is less often heard, and the suffragists are having a harder time convincing the general public that they are suffering from disabilities and wrongs which the ballot would right.

Even their oft repeated claim that a working woman's pay would advance if she had the ballot cannot be substantiated by facts. The ballot never raised men's wages, and it is nothing less than a delusion to suppose or expect that it would have the least effect on the wages of the working girl. The law of supply and demand will be the controlling factor in the regulation of wages of the working woman as long as there are more applicants for the positions in factories and commercial houses than there are available places. Furthermore, the temporary character of woman's work tends to keep her wages down. The girl enters a factory or business house with the idea, in nine cases out of ten, that she will stay there a few years until she is married. Her work is therefore largely unskilled, and as such cannot command high wages. No one can close his eyes to the fact that the road traveled by the woman who has been forced into a position of economic independence is hard and difficult, but it is a false notion to suppose that the ballot will be the panacea to bring about the much needed changes in the conditions under which she works.

It is easier to pull down than to build up, and it is this present day tendency toward destructive principles rather than constructive ones which the anti-suffragists are combating with much earnestness and with a firm conviction of the truth of their contentions, when they oppose the extension of the suffrage to their sex. The fact that since the public enunciation of their principles in the early nineties there has not been a single suffrage gain of any importance in any State in this country shows that there is considerable strength in this counter movement to woman suffrage.

BROOKLYN, N. Y.

Literature

The Bride of the Mistletoe

MR. JAMES LANE ALLEN writes a sort of foreboding preface to his new book.* And the story justifies the foreboding. A crueller book for women has not been written before this time. How an innocent old bachelor came by such marital information is a proof of the "second sight" of genius and also of the indifference of genius to the harm it may work. About the meanest thing any person could devise would be to give a copy of it to a young bride, or a middle-aged married woman, or any kind of a married woman. It contains the death sentence of love, written out with a kind of epic logic in a high anthem tone of spirit, as if the author was singing it gladly from the topmost bough of his tree of life.

It is not a novel; "it is a story," he writes in the preface.

"There are two characters—a middle-aged married couple living in a plain farmhouse, one point on the field of human nature is located; at that point one subject is treated; in the treatment one movement is directed toward one climax; no external event whatsoever is introduced; and the time is about forty hours."

There you have the skull and bones of the thing. The "plain farmhouse" is in Kentucky, which Mr. Allen raises before the reader's vision in the form of a great shield. "Nature forged it for some crisis in her long warfare of time and change, made use of it, and so left it lying as one of her ancient battlepieces—Kentucky." The pageant of time that he works out upon the shield before he introduces the "middle-aged married couple" is an illustration of the way a poet can emboss a figure of speech with the inlaid silver and gold and green of a fine literary style. The "one point on the field of human nature located" is the relation of husband and wife. The husband is a college professor carefully cherished in his home by a wife who is

infinitely his superior in nature, morals and understanding, altho Mr. Allen is far from intending to produce this impression. The man occupies his leisure hours studying forestry and the history of the human in connection with the history of the oak in particular.

The earth life has always dominated in Mr. Allen's work in some symbolic sense, and he has strained the sense to the last point in this book. It is not simply that he strips us, bones us and casts us back native mollusks into our native sea, nor that he drags us up out of it, only to set us to growing savage and wild in the wild and savage wood. He has done us a deeper wrong than dragging these, our prehistoric skeletons, out of the dust closets of time. It is difficult to tell what the wrong is, he has covered it with so many balsam sentences of sweetness, poured so much language frankincense and myrrh upon it, but as near as a poor, half-sacrificed reviewer can make out, he means that we are not moral except by chance or custom or coercion, which may be true, but the chief thing he means is that Nature just produces us, grows us and fathers us for sacrifices to the next higher order of beings, who in their turn must suffer the same fate. All is sacrifice. That is the one unchanging law. And apparently it calls for the woman first upon the Druid altar he has made the world into for the purposes of his story, which is not a story so much as it is an argument for sacrifice. The one "subject treated" which he mentions in his awful preface is the passing of the husband's love for his wife. The dramatic malignancy of the book consists in the poetic beauty and diabolical frankness with which the husband tells his wife on Christmas Eve, under the prolonged radiation of a symbolic Christmas tree, that he no longer loves her, and indeed, would like to make some passion experiments in old forest customs on his own account. Nothing could be more heinously correct than the callous way the husband makes the

*The Bride of the Mistletoe. Mr. James Lane Allen. New York: The Macmillan Co. 1906.

changed state of his affections perfectly clear to his wife. He is a philosopher, the season is past, the thing is done and cannot be helped.

The "climax" the author refers to in the same grim tone of voice in the preface takes place in the heart of the wife during the night. She goes thru all the dramatic phases of feminine depression, but these are only transient moods of the mere woman. Toward morning she becomes less the woman, more intelligently the sacrifice—which is to say, she resigns all thought of escape, hope or vengeance, and prepares to continue in the service of wifehood, performing all its duties, bereft of the one reward for such service—his love. Nature casts off her littler nature, her self-respect, strips her of every feminine art by which, for love's sake, she kept herself looking younger than she was, and binds her to the Great Altar. So, when he awakes, he finds her shorn of her beauty, confessing her years, toned down to being nothing but the one thing, sacrifice, for the coming order, for her children, for him and the honor of his name—and he is moved to pity her, but not to love—men never really love women after they have taken this veil for sacrifice. They merely revere and pity them.

This is the story. In the next paragraph of his preface Mr. Allen tells us there will be another book, with the scenes laid in the same house within the year. Well, let him write it. He cannot do a more devastating thing than he has done in this one. And possibly he may do better. He says in the last paragraph that there will be a third book also within the twelvemonth entitled "The Christmas Tree: An Interpretation." Half of the present volume is taken up with an interpretation of the Christmas tree, but it may be that he can keep it up indefinitely.

Christian Mysticism

A STYLE that is both intricate and cumbersome, a plan that entails much repetition and yet that does not present itself to the mind of the reader with clearness and illumination, and a subject that is abstruse and encumbered with much that is repulsive to modern ideas, combine to

make the two lengthy volumes on *The Mystical Element of Religion* an impossibility for the general public. And yet when a man of strong intellectual power and of cultivated mind and deeply religious nature embodies in a single book all that he has learned and tested of religion in some thirty years of adult life, during which he has made this learning and testing the matter of supreme importance, and when for seven years he has devoted himself to the task of putting his acquisitions into writing, it is at least superficially probable that his book contains a message for mankind. The work of Baron von Hügel has been to disentangle the real life and character of St. Catherine of Genoa from the accretions of tradition and indiscriminate adulation which have overlaid them, and at the same time to exhibit the deep and abiding significance of her teaching and example. St. Catherine is, however, only the text on which Baron von Hügel hangs his philosophy of the universe, a philosophy in which he endeavors to harmonize his religious and spiritual experience with all the contributions which have been made to human thought by the Greeks, the schoolmen and the scientists. The religion which he would present has a threefold basis. It is founded first on tradition and authority—the institutional Church. Its second support is reason and science—the intellectual, theological Church; and its third is personal faith and mysticism—the spiritual Church. Each one of the three elements is necessary to its completeness. The third element taken alone is subject to aberrations and fearful mistakes, but it is the life blood of the Church; and a church built on either of the first two bases, singly or combined, is a dead and cruel form. Men can no more quench their spiritual thirst at such a source than at a dry and empty well. The man to whom religion is a real and personal experience has drunk of the living water of mysticism.

Mr. Scott's little volume^a is another contribution to the rapidly growing mod-

^aTHE MYSTICAL ELEMENT OF RELIGION AS SET FORTH IN ST. CATHERINE OF GENOA AND HER FRIENDS. By Baron Friedrich von Hügel. Two Vols. NINE AND TEN. New York: E. P. Dutton & Co. \$6.

^bASPECTS OF CHRISTIAN MYSTICISM. By J. W. Major Scott, M.A. New York: E. P. Dutton & Co. Pp. ix+171. \$1.

ern literature of mysticism. It includes brief studies of twelve of the great Christian mystics, beginning with St. John and St. Paul, and ending with Peter Sterry, of Cambridge, who preached before Oliver Cromwell and who died in 1672. Each of the twelve is studied only from the point of view of his mystical teaching and as illustrating Mr. Scott's definition of a mystic. The mystic, according to this definition, is the man who lives not in time, but in eternity. He does not regard life from the viewpoint of temporal things, but he establishes eternal correspondences with things unseen. Mr. Scott writes:

"The unwavering belief of the Christian mystic is that it is possible to apprehend and assimilate spiritual truths; and in quietness and confidence he finds not only strength, but illumination. The knowledge of God which he seeks is attained by a fruitful stillness. He listens and waits for the still small voice of God speaking to him, and he believes that there is no knowledge of divine things so precious and so sure as that which is imparted in this way. Modern psychology might express this fact by speaking of an extension of the frontier of consciousness, but such a phrase scarcely conveys to the devout religious soul the deep meaning embodied in the aspiration of his heart."

The sketches which Mr. Scott gives are brief and slight. They are not intended to be complete or exhaustive even of the mystical side of his subject. In fact, they may be regarded rather as hints as to how discern the mystical element in the lives of the saints. In many cases even the hints are imperfect, and there is a distinct feeling of disappointment over Mr. Scott's failure to reach to the real heart of the subject.

Moral Education in Schools

THE widespread interest at the present time in the question of religion in the public schools is not alone responsible for the arduous work which has gone into these two bulky volumes.* A further cause has to be sought in the deep-seated conviction that, if the nations are to grow in righteousness, the growth must be fostered by means of ethical

training in the school. This was the conviction of a group of educationalists who met in private conference in London in the autumn of 1906, brought together by the exertions of Dr. Paton, principal emeritus of the Congregational Theological Institute of Nottingham; Mr. Harold Johnson, the well-known lecturer; Mr. W. T. Stead, editor of the *Review of Reviews*, of London, and President Clifford W. Barnes, of Illinois College.

The object of the conference was to consider what means might be employed in the schools to impart higher ideals of conduct, to strengthen character and to implant the desire to work for social ends. The question was one full of difficulties, and as a first step toward its solution, it was decided to institute an inquiry into the subject both in Great Britain and her colonies, and in some foreign countries. A letter, signed by the organizers of the conference, was sent to men and women known to be interested in education all over the United Kingdom, and in response to it a very large and representative advisory committee was formed. Thru the efforts of Professor C. W. Barnes, another committee, under the chairmanship of Dr. Nicholas Murray Butler, was then formed in the United States—a committee whose duties were to act in concert with the advisory committee, to promote moral training and the development of good citizenship thru the agency of the public school, and to report on some experiments in ethical training in the United States.

The plan of action of the English advisory committee was decided upon at a meeting held in London in February, 1907, when Mr. James Bryce, O. M., presided. The work of investigation was taken up by specially appointed commissioners, to whom was allotted the task of preparing reports on the methods of moral instruction and training in the schools of Great Britain and Ireland, France, Germany, Switzerland, Belgium, Norway, Denmark, Canada, Australia, New Zealand and Japan. The present volumes represent in brief the results of the investigation, and are put forward by the English committee, not as a solution of the problem of moral training, but as a small contribution to the data

*MORAL EDUCATION IN SCHOOLS. *Report of the English Advisory Committee on Moral Training in Schools, Based on an International Inquiry.* In two volumes. Vol. I, The United Kingdom; Vol. II, Foreign and Colonial. Edited on behalf of the Committee by M. C. Joseph. New York: Macmillan, Green & Co. Publishers, Inc., 1908. Pp. 400.

which must be collected before any reliable theory and method of training can be arrived at.

It is impossible to give even in briefest summary any idea of the many and diverse reports contained in the two volumes. One volume is entirely devoted to Great Britain and Ireland. The first hundred pages are taken up with a series of articles on moral instruction, how it can be made to appeal to children, and its connection with religion, by such divergent authorities as Professor Eucken, of Jena, winner this year of the Nobel Prize; Prof. J. J. Findlay, of Manchester University; Mrs. Bryant, D. S. C.; Rev. Michael Maher, director of the Jesuit Training College of Stonyhurst; Bishop Gore, of Birmingham; and among Americans, Prof. William James, President Stanley G. Hall and Dr. Felix Adler. Then follow the reports of the investigators on the great public schools of England and other secondary schools for boys and girls; on the elementary schools, both the council schools (which are unsectarian) and the schools belonging to the Church of England and the Roman Catholic Church, with a special chapter on Sunday schools and on the adult schools, which are the greatest modern monument of Quaker activity in England.

In the second volume the schools of Continental Europe are first considered. Then come those of England's great self-governing colonies, followed by a special notice of the work of Dr. Felix Adler in New York, and of the Normal Training Schools of Hyannis, Mass., and Albany, N. Y. These are the only American schools included in the two volumes; but it is to be hoped that the American committee will prepare a report on moral training in the schools of the United States on at least as extensive a scale as the report on British schools.

David Swing: Poet-Preacher. By Joseph Fort Newton. Chicago: The Unity Publishing Company. \$2.00.

There are men born to keep the ancient fences of theological pastures good, and other men born to take down the bars, or, if need be, to vault the rails, even at the risk of rent garments, where the dilapidated rails have been supple-

mented by the barbs of wire-drawn interpretation. David Swing was one of the latter class, born to dare the risk. Like Parker, Emerson and Frothingham among Unitarians; like Beecher, among the Congregationalists; Newton, among Episcopalians, David Swing gave the fence reeves trouble. Studying for the Presbyterian ministry, the young Swing's "calling" did not seem quite sure. "Predestination" gave way in him to "pedestrianation," as one of his humorous critics later called it, and he was not long in beginning his "travels." First, however, he accepted a position at the Miami University, as Professor of the Classics and preceptor in the preparatory classes. Like Bancroft and Phillips Brooks, he made a promising failure of it; yet he remained at the University fifteen years—"too gentle to train boys for college," we are told. When he finally began to preach as a settled minister, it was at Chicago, in 1866. From that date on to 1874, he was "pedestrianating" vigorously, and had reversed the old creed of his church. "I am," he said, "first, a Christian; next, a broad Christian; thirdly, a Calvinist; and, fourthly, a Presbyterian." The various steps in this progress are sufficiently indicated by the biographer in an interpretative exposition of many sermons. Indeed, Mr. Newton's task is one of peripatetic exposition in the groves of some suburban academy, walking amid flowers of rhetoric, where he stops, perhaps, too willingly to gather and explain a bunch of pinks or sweet mignonette. In 1784 came the heresy trial. The charges against the eloquent and successful minister were principally that "he had not been zealous and faithful in maintaining the truths of the gospel," nor "diligent in the exercise of the duties of his office as a minister," and that he did not "sincerely receive and adopt the Confession of Faith of this Church as containing the system of doctrine taught in the Holy Scriptures." Swing was acquitted, but the Presbytery was not; and the minister withdrew from the Church, founding a Church of a freer expression in the "Central Musical Hall," and there he preached and prayed and worked to the end, making his own definition of Calvinism—assuming Christ still as divine, but

preaching his humanity, not his divinity. He was henceforth to him, "a Teacher of heavenly truth, a sorrowful light-bringer and a wise way-shower of humanity," where the unspeakable difference between Christ and other men survived in the Capitals. A biography is always more interesting than an expository appreciation; and so far Mr. Newton's work will perhaps find less favor with the average reader than it would have found if the views of the great Chicago preacher had been more concisely stated and illustrated in the words of the preacher, and the facts of his life, his work, his associations, etc., more fully unfolded.

Accounts, Their Construction and Interpretation. By William Morse Cole. Boston: The Houghton, Mifflin Co. Price, \$2.00.

The study of accounting is still new in the college curriculum, and it is only lately that books on the subject adapted to the general student, as well as to the practising accountants have begun to appear. A general feeling has prevailed for some time past that accounting or "accountancy," as the science is sometimes called, is shrouded in mystery, and that only those who have served long apprenticeships as head bookkeepers or auditors could ever hope to understand the full meaning of the financial statements of business concerns. Professor Cole's book should have the effect of dispelling this feeling. His clear exposition of the subject, free from abstruse technical minutæ, enables any one having the most rudimentary training in economic and mathematical principles to fully comprehend the important details. The book is useful, therefore, both to the student and to the man of affairs. To understand the nature of accounts, to interpret them properly, is of as much importance to the average citizen in these times of corporate business organization, when a large share of the invested wealth of the masses is in the hands of a few captains of industry, as a knowledge of the underlying principles of the government under which he lives. The usefulness of Professor Cole's book, therefore, should not be limited to the classroom or to the accountant's office. It should

find its way into the hands of all persons interested in publicity in corporate affairs.

Bartholomew de las Casas. By Francis Augustus MacNutt. New York: G. P. Putnam's Sons. Price, \$3.50.

Bartholomew de Las Casas, one of the most active and devoted members of that great band of sixteenth century missionaries who went out from Spain to conquer the heathen world with spiritual weapons, affords a striking figure for a sympathetic biographer. His restless, vehement, and withal deeply religious life was devoted sometimes with more zeal than wisdom, to a protest against the treatment which the Spaniards meted out to the natives in the New World; in this cause he made journey after journey to Spain during a period of more than fifty years; he denounced his fellow countrymen in high and low places in terms as bitter as they were unmeasured; and lest his work should perish with him he left to the College of San Gregorio in Valladolid a vast collection of manuscript evidence against his countrymen, *ad perpetuam rei memoriam*, in order that, he wrote, "should God decree the destruction of Spain, it may be seen that it is because of our destruction of the Indies, and His justice may be made apparent." He was, in short, the combined St. Francis and William Lloyd Garrison of Spanish America. This militant priest has found in Mr. MacNutt a biographer with many literary qualifications for the work he has undertaken—a wide knowledge of the Las Casas literature, a sympathetic insight into high motives, and a facile pen. To Mr. MacNutt, Las Casas was a hero, a saint, and a prophet; and whoever does not go beyond this volume will be convinced. However, to be more prosaic, it must be admitted that to the critical student of Spanish administration, the belligerent bishop was a querulous, hot-headed, indiscriminating trouble-maker with a journalistic imagination and a Franciscan vocabulary. Mr. MacNutt has taken Las Casas's indictment of Spanish colonial administration practically at face value and apparently has not deemed it within his province to consider the more mundane aspects of the

vexed questions with which the Spaniards had to cope. He would have written with less enthusiasm (tho perhaps with less charm) and yet with more balance if he had weighed carefully the contentions of more recent scholars, such, for example, as the late Mr. Payne, whose investigations into Spanish government in the New World led him to conclude:

"The aboriginal population, freed from the grinding tyranny of their old masters, increased and thrived. . . . Both Peru and Mexico assumed gradually the semblance of civilized life, and their prosperity testified to the benefits conferred on them by conquests which, however unjustifiable upon abstract grounds, in both cases redeemed the populations affected by them from cruel and oppressive native governments and bloody and senseless religions."

Without joining issue in this controversy, we may fairly say that Mr. MacNutt has written a fascinating story of Las Casas and his publishers have given the story a material form that is a delight to the eye.

Beethoven's Letters. A Critical Edition with Explanatory Notes. By Dr. A. C. Kalischer. Translated with preface by J. S. Shedlock. Two volumes. New York: E. P. Dutton & Co. \$7.50 net.

Ludwig van Beethoven, among the two or three greatest composers of music this world has ever known, was a puissant soul, a man of intensely individual character, a great and remarkable human personality. His letters, as Mr. Shedlock remarks in his preface to the present collection of them, afford a unique means of studying the man in relation to his times. Indeed, they constitute perhaps the best biography of this titanic genius of the tone world, certainly the basis of all that we know of his life and character. Therefore Dr. Kalischer, who is admittedly one of the ablest and most active successors of the American Alexander Wheelock Thayer in what the Germans call "Beethoven investigation," has performed an important service in gathering from all known sources this collection, which contains nearly five hundred more letters than any former edition. The two big octavo volumes give us 1,220 letters, varying from a line or two to several pages of print. So far as possible, the date of each has been ascertained, and Dr. Ka-

lischer has appended to each a footnote giving the source from which it is derived, explaining all references to persons and events, identifying the musical compositions mentioned, and providing as much information as possible to help the reader to a complete understanding of the letters. The editor's task of deciphering Beethoven's erratic handwriting, puzzling out his often cryptic style, and collating printed letters with the original copies, was a gigantic one, on which he tells us he was engaged for a good twenty years. The translator also had difficulties to overcome—Austrian dialect words, imperfect, ungrammatical and obscure sentences. He has been remarkably successful in turning the whole into good English, and in the main the translation is admirable. His preface provides an interesting and suggestive analysis of the character Beethoven has given himself in this mass of correspondence. It is abundantly evident that the master had no thought of his letters ever being published. His words express only the state of his feelings at the time of writing. He was a man of varied moods and of sudden changes of mood. Choleric and hasty, he often repented and acknowledged he was wrong. Thus, in 1799, he wrote to the composer J. N. Hummel: "Do not come to me any more. You are a false fellow, and the knacker take all such." The next day he wrote again: "Good Friend Nazerl, You are an honorable fellow, and I see you were right. So come this afternoon to me. You will also find Schuppanzigh, and both of us will blow you up, thump you and shake you, so you will have a fine time of it. Your Beethoven, also named Mehlschöberl, embraces you." In household and ordinary affairs he was deplorably unpractical and always in trouble. In reading the letters, Mr. Shedlock truly says, one cannot but marvel at the man who, while worried by servants and having to look after trivial matters, could compose works which now afford the highest rapture. There are abundant allusions to the more serious things that made their deep impression on Beethoven—deeply touching references to his oncoming deafness, his sorrow and despair, most interesting remarks on other great composers.

The Life of the Spirit. An Introduction to Philosophy. By Rudolf Eucken. Translated by F. L. Pogson. New York: G. P. Putnam's Sons. \$1.50.

Last year when Professor Eucken received the Nobel prize for the greatest work in literature of an idealistic nature we explained in *THE INDEPENDENT* why he had determined to appeal to a wider audience than gathered in his lecture room at Jena. It is part of the same movement which has led the followers of Haeckel to make converts by the hundred thousand to materialistic monism, the higher critics to express their reconstructed picture of Christ in series of cheap and well written books, and the conservative theologians to meet them with the same popular weapons. Professor Eucken fights with both hands; on the one side against the quietistic and pessimistic philosophy of modern Buddhism, germanized by Schopenhauer and Hartmann, and on the other against the ruthless egoism represented by Nietzsche. Against these Eucken brings a philosophy which has the fervor of a religion, which appeals to men to open their souls to the infinite spirit and develop their higher natures thru faith. The public has given ear to his appeal and his works are in more demand now in Germany than any other philosophical literature. But what passes for popularized philosophy in Germany would be regarded as highly abstruse in America, so there is little probability of such a reception being given to his books here. In the present volume he takes up in turn the fundamental problems of philosophy; unity and multiplicity, change and persistence, the outer and inner world, the problem of truth and the problem of happiness, and shows what has been done to solve them by the Greeks, by the medieval schoolmen and by modern thinkers.

Grant, the Man of Mystery. By Col. Nicholas Smith. Milwaukee: The Young Churchman Co. \$1.50.

There is nothing much that is new, either in viewpoint or in data, in this book. Colonel Smith aims to give a simple and concise sketch of the main incidents in Grant's life and a characterization of the hero's personality. The

work is well, if not brilliantly, done, tho something too much is made of an imputed "mystery" in Grant's personality. No doubt Grant was simple in manner and taciturn in speech; and his rapid rise from the state of a baffled and beaten civilian to that of the commander-in-chief of the nation's armies was perhaps unexampled in the world's history. But for all that, it is a difficult task to make him out an unsolvable riddle. If the man was exceptional, so also were the circumstances under which he rose. The personal note in the book is eulogistic thruout, but while the eulogy is somewhat lavish, it is on the whole discriminating. The volume is an excellent one out of which to get a first acquaintance with the great commander.

Altorientalische Texte und Bilder zum Alten Testamente. In Verbindung mit Dr. Arthur Ungnad und Dr. Hermann Ranke, herausgegeben von Lic. Dr. Hugo Gressmann, a.c. Professor der Theologie in Berlin. Erste Band: Texte, 8vo, pp. xiv, 253. J. C. B. Mohr, Tübingen. Price, 7.20 marks; the two volumes, bound, 17 marks.

This is the kind of work which we may expect in German or French, but not in English. It ought at least to be translated for reference and study by English readers interested in the Bible. This first volume attempts to give bare translations of all texts recovered from the ancient East which will throw light on the Old Testament, whether from Babylonia, Assyria, Asia Minor, Syria or Egypt. Those from Egypt are here carefully collected for the first time. They include creation stories and other myths, psalms and lamentations, chronological and historical texts, codes of laws like that of Hammurabi, and ethical wisdom like that of Ptah-hotep. The second volume, which by this time ought to be issued, is devoted to a rare collection of illustrations from the ancient art of the same regions, and covers equally history, worship and manners. Who will translate and publish it, as Perrot and Chipiez's series of volumes on the history of ancient art were published in English by Chapman & Hall, London?

Literary Notes

...The liveliness of the pragmatic controversy is evinced by the July number of the *Hibbert Journal*, of Boston, which contains articles by both Schiller and Dewey and also an attack on the Schiller-Dewey pragmatism. Other articles of especial interest are that by Professor Weinel, of Jena, explaining the new religious movements in Germany, that by Professor More, of Cincinnati, showing the inadequacy of mechanics to interpret the field of physics, and that by G. K. Chesterton defending in his unique style the Christian view of Jesus.

...The simple practicability of Louise Brigham's *Box Furniture* will tempt most who take up the book to begin at once the construction of the articles described in her pages. The work has a seriously helpful purpose for those of the selvedge of civilization—the pioneers at the ends of the earth, and the poor in our midst—but it is also a surprise box of delights for boys and girls, a useful course in manual training and a refuge for those who seek in simple physical occupation relaxation of mental strain. No pleasanter summer could be spent than in furnishing a camp with this box work, which progresses from plain to intricate articles and designs. The book is not theoretical, but based on the actual experience of the author in Spitzbergen, of all places in the world. Her directions are to the point, her illustrations helpful, and the required material is easily obtained. (Century Co.)

...The vocation bureau established at the Civic Service House in Boston last year was based on so eminently practical and serviceable an idea that it at once attracted wide attention, with the welcome result that similar bureaus for the guidance and information of young men and women in the choice of a profession or trade were opened in other cities. The original Boston bureau was in charge of the late Prof. Frank Parsons, Ph. D., who finished, just before his death, an exhaustive book on the scope, requirements and methods followed by him in his work. *Choosing a Vocation*, intended chiefly for the vocation bureau adviser, will be found of no less interest by educators and parents, and by young men and women at the beginning of life. The movement promises to become an important factor in the organized movements for social and economic betterment of our day. Professor Parsons's book will serve as the basis on which its growth and development are to be built. (Houghton, Mifflin Co., large crown 8vo., \$1 net.)

...The large number of letters we received on the prohibition question shows how widespread and intense is the interest in the subject. Campaign literature on both sides is abundant. The most compact and authentic arsenal of ammunition for the prohibition forces is the *Anti-Saloon Yearbook for 1909*, edited by E. H. Cherrington (Anti-Saloon League, 110 La Salle avenue, Chicago. Manila bound, 35 cents; cloth, 60 cents). This gives the latest facts and figures in clear and forcible

form, with graphical and topographical illustrations. *The World Book of Temperance*, containing temperance lessons by Dr. and Mrs. Wilbur F. Crafts (International Reform Bureau, 206 Pennsylvania avenue, Washington, 75 cents) deals less with the legal than with the moral and religious aspects of the question. On the other side we have the *Yearbook of the United States Brewers' Association* (U. S. Brewers' Association, New York) giving statistics to prove that prohibition does not prohibit and arguments to prove that it should not. We note that in the chapter on "The Probable Trend of Legislation" the opinion is expressed: "There are few signs that the prohibition wave which has swept up from the South is about to recede. Only those who are ignorant of the history of the past will dare predict that the wave has already reached its highest point." Professor Münsterberg's attack on prohibition is quoted at length.

Pebbles

"I COULD waltz on to heaven with you."

The Girl (absently)—Can you reverse.—*Yale Record*.

"THEODORE is sure getting after the lion family."

"Yep, I hear he's making quite a fu-ror."—*Cornell Widow*.

"OWD George's wooden leg been giving him pain lately."

"Don't you be talkin' so foolish, Willum."

"It's sure enough. 'Is owd woman been a-whoppin' him wi' it."—*London Opinion*.

THE LADY—Well, I'll give you twopence; not because you deserve it, mind, but because it pleases me.

The Tramp—Thank you, mum. Couldn't yer make it a tenner an' thoro'ly enjoy yourself?—*The Housekeeper*.

MR. MARTIN—Mr. Miller is after finding out why his cow went dry.

Miss Hogan—And what was it?

Mr. Martin—His bye Willie milked the poor creature wid wan of thim new fangled dust sucking machines.—*Puck*.

At Cambridge Professor Whitmore tells it this way:

"Wilkins and I were waiting for a train at Onosquahami, Michigan, when we joined a group of men at the window of the telegraph office, where the operator was writing bulletins of a baseball game between Harvard and Yale. A lumberman who evidently had bet on Yale was grumbling over his loss. He swore a great deal and said the New Haven players were a sandless lot of quitters. He was going to say a great deal more when a tall, husky young fellow pushed thru the crowd, took him by the shoulder and swung him around.

"'Pardon me,' he said, politely, enough though his eyes were blazing—'pardon me, but I can't stand any more of that abuse. I won't stand it! I'm an *alum mater* of Yale myself'" *Harpers' Weekly*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
150 Fulton Street New York

A WEEKLY MAGAZINE. FOUNDED IN 1818.

One Year, \$2.00 Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other publications, and club rates will be granted as low as offered by any responsible agent.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on request of subscribers' policy any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the papers comprising any semi-annual volume are returned to us protected in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Seattle and Jamestown

THE Alaska-Yukon-Pacific Exposition of 1909 forms an interesting contrast with the Jamestown Ter-Centennial Exposition of 1907. They can well be compared, because in aim and scope they are much alike. Neither, of course, is to be classed with the great international expositions held at Chicago and St. Louis. The Seattle and Jamestown expositions are not intended to be regarded as international; they are not even national, but sectional. They were organized for the purpose of calling attention to the progress and resources of, respectively, our great northwestern and our great southeastern coast regions, and were appropriately located on two of the finest harbors of the Pacific and Atlantic. Such expositions are a perfectly legitimate, and, when properly managed, a very effective method of advertising a country. In Europe they have been employed more frequently and to better advantage than in the United States.

The success of an exposition from the standpoint of its promoters may be measured by, first, the favorable impression produced upon visitors; second,

the number of people seeing it, and third, the financial returns. To put the matter bluntly, Jamestown was a failure and Seattle a success, according to these tests. It was, of course, intended that the visitor to Jamestown should go away with the impression that the people of that vicinity were enterprising, up-to-date and business-like; ready and capable of undertaking ambitious projects for the industrial development of their country. As a matter of fact, the visitor came away with a very different impression, and it is questionable whether Norfolk and Virginia derived any material advantage on the whole from the money they put into the fair.

It is impossible to compare the number of visitors to the two expositions, because the Jamestown officials refused to divulge the daily attendance, altho, since the Government had a lien on the gate receipts, it might be supposed that the public had a right to the information. Our estimate at the time, based on a count at the gates, was "probably not over 5,000 a day and perhaps less than 3,000." This turned out to be a ridiculous exaggeration. When the exposition company came to settle up with the Government it appeared that the average paid attendance was less than 1,500. At Seattle the attendance is published every day in the papers. The daily average up to July 17 was 24,260. The million mark was passed on the forty-first day, with three-fourths of the time still to run. It is expected that everything will be paid for and the stockholders will receive substantial dividends on their investment. This will be something unusual in the history of American expositions. How much was lost by those who invested in the Jamestown stock cannot be told, because we do not know how much was paid in. But in regard to what we, the people of the United States, lost at Jamestown, some estimate can be made. The United States appropriated for that exposition in one form and another \$2,765,000. Of this a million dollars was supposed to be a loan "secured" by a lien of 40 per cent on the gate receipts, the exposition company having applied to our benevolent Government after it had found that no private capitalist was willing to accept

that sort of security. The United States got back only about \$140,000 from this loan. About \$2,000,000 also were spent at Jamestown by the twenty-five States which took part in the exposition.

On the other hand, the Seattle people have been self-reliant and independent. The United States Government has contributed nothing but its building.

At Seattle the exposition was ready on time, not a year behind or two months behind. The grounds were finished and all the buildings open with the exception of the Hawaiian exhibit, which was soon after installed. At Jamestown the season was half or two-thirds over before some of the structural work was done, such as the art building and the Government piers.

The A.-Y.-P. buildings are placed upon the campus of the State university, where most of them will remain for appropriate purposes. The forestry building will house the forestry school, the Washington building will become the library, Machinery Hall will go to the engineers, the women's building will remain such, the auditorium will be utilized by the lawyers, and the Fine Arts Museum by the chemists, while the university will benefit by the light and power plant, the sewerage system, the stadium, asphalted roads, botanical garden, etc., the whole valued at a million dollars. We wish the University of Virginia had the numerous substantial and expensive buildings that were put on the sand bank seven miles from Norfolk. Why it was required that they should be built of stone and brick instead of the usual staff and steel nobody knows, or at least nobody tells.

Virginia alone has three times the population of the State of Washington, while a circle with a radius of a day's railroad ride from Norfolk includes a larger tributary population than either Chicago or St. Louis had. The Jamestown Exposition had more buildings, a greater variety of exhibits and a historic occasion and environment, and it was more extensively advertised than the exposition at Seattle. Why, then, has the latter drawn better?

One reason is doubtless the climatic advantage. Rain is better than hot sunshine. To both the steamboat excursions

roundabout are the most attractive feature, but the scenery about Jamestown is stale, flat and unprofitable, while mountains and sea combine to give Seattle an exceptionally beautiful setting.

But a great mistake of the Jamestown directors was in the character of their appeal to the people. They advertised relics and reminiscences as their chief attraction. Everything old was dug up and made to appear older. Jamestown stood for the past. Seattle stands for the future. Jamestown stood for war and its pomp. Seattle stands for peace and its opportunities. It may be a failing in them, but it is a fact, that the American people as a whole do not care so much about the past—which can't be helped, so what's the use of talking about it—as they care for the future, which they hope to have a share in, and can have a share in shaping. They are not so much interested in the John Smith of three hundred years ago as in the others of that name who are colonizing the new lands of Alaska, Yukon and the Pacific. No doubt the American and Japanese battleships at Seattle attract many visitors, as did the greater fleet at Jamestown, but it is a fact that we Americans, even in this twentieth century, are more concerned with the arts of peace than with arts of war.

The President's Belated Intervention

MR. TAFT continued to insist, last week, upon those four additions to the free list, and was repeatedly told by Senator Aldrich that it would be very difficult, and probably impossible, to obtain them. Perhaps the Senator explained how he had procured a majority for large increases of the rates on cotton goods and certain other products by retaining the duties on raw materials, and pointed out that bargains of this kind should not be repudiated. The President also began to talk about proportionate reductions of the duties upon the finished products in the manufacture of which such raw materials as hides and iron ore are used. Then he was told that it was no longer practicable to change a majority

of these duties, although reductions of a few of them (within certain limits) could still be made.

For example, he suggested that the duties on shoes should be cut down or removed, if hides were to go on the free list. But the duty on shoes was made 15 per cent. by the House, and 20 per cent. by the Senate. The conference committee could not go beyond these limits, in either direction. If a duty of 10 per cent. were required, authority to report for such a duty must be obtained from both the Senate and the House by a concurrent resolution. Such a resolution might not be passed. If introduced, it would renew the tariff debate and be subject to all sorts of amendments.

This shows how the President, intervening at so late a day, has been confronted by the rules and by what has already been done. Of course, if the duty on a raw material is removed, there should be proportionate reductions of the duties on finished products, for these duties are largely compensatory for the underlying rates. Free iron ore calls for lower duties on steel. But Mr. Aldrich, while consenting to a slight reduction on ore, has raised the present duty of \$10 a ton on structural steel to about \$16. If raw materials now dutiable are made free, without a corresponding reduction of duties on finished products, the change is to the advantage of the manufacturers, especially in any industry in which competition has been wholly or partly suppressed. Thus, Mr. Taft's proposed additions to the free list might be enacted, with the effect of increasing manufacturers' profits and giving no relief to consumers.

The President also began to criticise the duties on cotton and woolen goods, owing, it may be, to incontrovertible evidence laid before him by associations of merchants. But it was expected at the end of the week that the conference committee would, by compromise, make the rates on cotton goods, hosiery and gloves considerably higher than they are in the present law. It is noticeable that in all this recent discussion at Washington nothing has been said about the new basis of valuation, although this alone promises to increase many of the duties by a considerable percentage.

As we have said before, if Mr. Taft should induce Congress to put hides, iron ore, petroleum and bituminous coal on the free list, the effect upon the whole tariff and upon the cost of living would be scarcely perceptible. Accompanying just reductions of the allied finished products would give consumers some benefit, but at this writing such reductions are not expected.

It should be remembered that a large part of the present Dingley tariff (which was admittedly made too high in order that there might be room for reduction by treaties of reciprocity) has not been disturbed by House or Senate, and therefore is beyond the reach of a conference committee, and that in dealing with rates as to which House and Senate disagree, the committee must work within the upper and lower limits. The rules which thus govern its procedure can be modified with respect to separate items only by the special and concurrent action and instructions of House and Senate. These conditions tend, in this final stage of the long contest, to prevent such action concerning finished products as the President is beginning to regard as desirable.

It is difficult to understand why the President, so actively insisting upon reductions at this late day, and so persistently exerting his influence to obtain them, not only made no effort whatever for downward revision thruout the weeks and months when he could have accomplished something (because the almost insurmountable obstacles which now confront him did not then exist), but even permitted the insurgent Republican Senators to believe that their movement had his disapproval. And yet, from day to day, they were exposing the inequitable rates which within the last few days he has begun to criticise. He has repeatedly insisted upon a due regard for the doctrine laid down in the Republican platform, but if the facts presented in the memorable Senate debate were not wholly ignored by him, he must have realized that the controlling majority was making no attempt to measure protective rates by the difference in costs of production, plus a reasonable profit. He should have urged that majority to shape its course in accord with the platform doctrine. If he

had done so, the two bills sent to conference would have been much less objectionable than those which the committee has been considering and which he has been trying to improve.

His interest was manifested and his influence was exerted at too late a day. His demands at first touched only a small part of the broad tariff field, avoiding inequitable schedules which had been shamefully manipulated to the disadvantage of consumers, and when the conference stage was reached the rules and a network of bargains three or four months old made it extremely difficult for the controlling majority to grant what he desired, even if it had been willing to do this. It seems to us that he must have known about the barriers that the conference rules would raise. When it was reported from the White House, not long after the beginning of the Senate debate, that he intended to deal with the conference committee, these rules and the effect of them were pointed out to him by scores of newspapers, and, doubtless, by legislators and others who desired a reasonable downward revision. His active and persistent intervention after the conference committee began its work indicates that he was not restrained at an earlier date by a feeling that he ought not to attempt to shape legislation. For Congress is still in session, the tariff bill has not been enacted, and thruout last week he was striving to shape the revision by a direct exertion of his influence. For what he may now accomplish he will receive due credit from the people, but many a loyal friend will think that by delay he lost his opportunity.

The Counter Influence to Woman Suffrage

"THERE are very few arguments in favor of woman suffrage and none against it" has more truth in it than most such aphorisms, and sufficiently accounts for the fact, to which Miss Chittenden calls attention in this issue, that the movement has not made so much progress in this country as its friends would like. That is to say, the value of the suffrage to any class is largely symbolic, like the granting of independence to a country,

and its advantages are usually not susceptible of a striking demonstration. We believe that the suffrage is as necessary to men as it is to women, yet we are obliged to admit that Washington, where the men do not vote, is as well governed as Philadelphia, where they do. The obtaining of the suffrage is only a part, tho we believe it to be a logical and essential part, of the general movement for the emancipation of women from the oppression of unjust laws, customs and opinions.

Miss Chittenden is mistaken in saying that such industrial, legal and educational freedom as woman now enjoys was obtained "without any serious opposition." On the contrary, every step of this progress was made against the most bitter and unscrupulous opposition, with martyrdoms more real than those of Holloway Jail, and at every step the courageous women, who were breaking new paths, had against them not only the indifference of the bulk of their sex, but the active antagonism of a few of them, taking the same attitude and using the same arguments as Miss Chittenden now uses to check further progress toward freedom and equality. If Miss Chittenden thinks it easy let her attempt to enter any of the doors that are still closed to women. Let her try to become an Episcopal minister, to get an education at Princeton University or to procure for a New York widow a share in the money she has earned during marriage.

That the cause of women in the matter of suffrage during the last few years has made greater advances "in countries where monarchical government prevails" than in the United States is undeniable. It is also true, unfortunately, that the same may be said of other forms of progressive legislation, as well as of progress in science, literature, music, and art. The numerous defeats which Miss Chittenden records are due to the policy of the suffragists, which is to bring the measure before every legislature every year until it is passed and to have it put to popular vote as often as possible. The wisdom of such tactics may be questioned, but it shows at least that the suffragists have not lost all their feminine characteristics.

Miss Chittenden states, apparently as an argument against the suffrage, that it was granted in the four States as part of

the Populist movement. This is rather amazing, since it existed in two of them more than twenty years before the Populist party was organized. She is also unfortunate in her reference to Kansas. We would be willing to back any city in Kansas against Miss Chittenden's own city of Brooklyn for honesty, efficiency and economy in government. We do not say that the superiority of Kansas municipalities is due altogether to the votes of the women, but we do know that they were materially improved by the adoption of woman suffrage, and we believe that other municipalities, possibly even Brooklyn, might be benefited by putting the ballot into the hands of the sex which is the majority in our churches and in the minority in our penitentiaries.

July and Currants

JULY opens with the currant, a humble sort of fruit, but beautiful and wonderfully helpful. It is these small and modest things that, after all, take off the sharp edge of daily life. Think what the currant bush did for our fathers, when there were no strawberries or raspberries or even blackberries in our gardens. Dutch in name and origin, it attached itself to the Puritan during his residence in Holland; tart as his theology, but good for the stomach and the liver. The bush gave the pioneer no trouble, for it would grow easily anywhere, bore neglect humbly, had no haughty manners and always did its best.

It came to New England with the earliest colonists—probably with the "Mayflower"; grew in the garden of Governor Winthrop, and was picked by Priscilla for John Alden. There was currant jelly in those days, and there were green currant pies, to test the vitals of the visiting Massasoit. Currant wines also were held in high esteem, before there were apples grown big enough for cider.

These humble Dutch currants were good enough for the highest in the land, for one of the early presidents of Harvard tells us that he did work of a morning in his currant garden, and that he was greatly refreshed by a handful of fine fruit, on July the first. These, he noted, were unusually sweet, and were

better flavored than the black raspberries that grew in "ye stump lot." He tells us also that the white currant is sweeter than the red, a fact that we have put to good advantage in these later days.

When the Connecticut folk had all become Yankees, and had started westward, the one plant that everybody took with him was the currant bush. These were planted first in Central New York, then in and about Cleveland and in the Muskingum Valley, and there they are yet; just the same plain-hearted currants, refreshing in summer drink, unrivaled for winter jelly and jam, and specially at home in the poor man's garden.

But the people grew, and the towns grew, and fewer folks could have gardens; and the currant bush does not like the smoke of the congested houses, altho we have seen one in the window of a tenement, eight stories up in the air. It became a great national fruit. Then began a stride of improvement, for out of our miseries spring our blessings. The cherry currant was born—not quite as big as a cherry, but squinting that way; a stiff bush, a tasteless fruit, and nothing to boast of but bigness. That is the way it often is when you begin progress, for it is a long road to perfection. No one should sit contented on the first stair.

A great career opened, and the little Dutch currant was transformed by degrees into the Versailles, the London Market, the Fays Prolific, and now it rests awhile at White Grape and Red Giant—the two biggest and sweetest and most prolific of the currant race. There are men whose lives have been given to making a model currant. Some of these have done great things, and a few have reaped big profits. It seems a small thing to do, but after all, apart from the personal gains, it is worth the while to benefit humanity with a Fays Prolific, a currant that gave the originator \$30,000, and to every grower of currants three times as much profit from his garden.

Let us go with the pickers into a modern currant field, two or three acres in extent, and in long rows that open to the north and south. The bushes are nearly as high as your head, and the

Red Giant stands even taller than that. Take a stool with you and sit down under a big bush, and let your editorial fingers forget the pen, while you fill a basket with these noble and earliest to ripen, the Fourth of Julys. This is not the best of currants, only the earliest, and it has a deep rich crimson color that is most beautiful. Over you stand large spreading apple trees, for your currant bushes love the shade. It is an ideal service, and you can easily earn your supper of Holstein milk and strawberries.

The city has no charm like this, but can we ever break its power? Is the longing for a simple life impossible to be fulfilled for the crowd? Even the currant is changed, but it loves the soil yet. It is just the same at heart as it was when old Put pulled a stout bush to thrash a Tory with. It is still the people's fruit. It has gone with the pioneers into Michigan, and Wisconsin, and up into the Dakotas, and down into California. It endures cold and heat, and do not forget how many fever-parched tongues it has relieved. It is a very genuine pride that stirs the housekeeper when she counts her fifty glasses of jelly; and how many tens of thousands of glasses are yearly prepared in these United States? There are enough surely to greatly alleviate sickness and make our hours of health more wholeness. A dainty sight is a stem strung with crimson beads, but sweeter every time is the currant that is white. And this white currant is also just as good for jelly, for this jelly, strange to say, is a delicate crimson. Birds do not detect them so easily, and they are naturally along the line of best survival.

We should like to pick currants here all day, possibly two days; but alas! the city chiel has no training for this sort of work. The soft breezes and the apple shade, and the landscapes that sweep thru farms and hold villages in their arms down the valley, and up the opposite slope, and the whistle of the bobolinks overhead, and the trill of an orchard oriole—all these combined grow monotonous, and we are homesick out here in God's home. Well, July is ending, and we all have our duties and our calling is louder than our choice. Yet

we wish everybody had a currant garden and we wish that everybody wished he had. The spirit moves, at any rate, and the people are moving. The cities are thinning and loosening a little, and the country is not so foreign as it was. Open up, ye compacted, solidified, congested masses, and spread your homes out wider over the valleys and the hill slopes, and let in the air and the birds and the brooks. Melt your hearts for the rose bushes, and the currant bushes, and let every family have its acre and every child its playground. Then will the editorial office, and every other office, have a bit of God's unrented sky for roof, and a rock shall be our table, while the brook shall ask a thousand questions and never wait for an answer.

Liberia's Crisis and Appeal

THE financial soundness and governmental integrity of Liberia are emphasized in brief interviews given out by different members of the American commission to the negro republic, altho their official report to the President has not yet been submitted. Liberia owes something like \$1,400,000 in all, about one-third of this amount being local indebtedness, chiefly arrears of salaries due Government officials. The bulk of the public debt represents the British loans of 1871 and 1906, both of which were attended with frauds of such a character that they might be repudiated if the Liberians had such a desire. These figures, when placed alongside those of Japan—\$1,125,000,000, of which \$50,000,000 is local indebtedness—seem trivial, especially in view of the reputed richness of Liberia's undeveloped resources.

The appeal which Liberia has made to the United States thru our commissioners includes a request that our Government or American capitalists will liquidate this debt and thereby free the little republic from the irksome interference of Great Britain in Liberian affairs. The unanimous sentiment of the Americo-Liberians on this subject is reflected in a recent editorial in the *Liberian Register*, a newspaper published by a Liberian official and practically edited by the Cabinet:

"There is no desire to repudiate one cent

of our national obligations, no matter how they came to stand against us. The debt is not very large and we believe that if refunded at a reasonable rate of interest and on terms that are fair to our creditors and just to ourselves, the debt can be easily managed."

The Liberian Government asks also for the loan of a financial expert, who will practically have charge of all receipts and disbursements until the national obligations have been canceled. It is expected that by that time this financial adviser will have materially assisted in training Liberians to paddle

The lightly dotted line indicates the supposed boundary in 1892 after the seizure of territory east of the Cavalla River. The heavily dotted line is the new boundary pegged out by the delimiting commission and not yet ratified.

their own financial canoe. The British Government has been using pressure for more than a year to have one of its experts appointed to the place, but the motive back of the persistent desire has been suspected. It is possible that this British aspirant might be useful in the British colony of Sierra Leone, whose last financial report was discouraging.

The Liberians ask no American aid in the conduct of their executive, judicial and legislative departments, but they would like to have an American educator take charge of their public school system, an American army officer to organize their frontier force, and a man

from our Department of Agriculture to pull their farmers out of the Slough of Despond. For the services of these experts they are willing to pay reasonable salaries.

Next to the liquidation of the debt, however, Liberia's most urgent desire is that its boundary troubles may be settled once for all. The Anglo-Liberian boundary has been clearly defined, with Anglo-Saxon precision—but the negro republic now wants somebody to make British troops stay on the Sierra Leone side of the line. England claims no territorial rights in the region about Kanre Lahun, but no Liberian official is permitted to enter it.

The Franco-Liberian border, on the north and east, has never been definitely defined. Attempts have repeatedly been made, but the treaties (drawn up always by France) have proven so elastic that the borders of French Guinea and of the Ivory Coast have been pushed farther and farther into Liberia. At least one-third of what was once considered Liberian territory is now under the French flag. The present complaint, however, is not based so much upon these past aggressions as upon the present attitude of the French Governors, who insist upon interpreting the terms of the treaties to suit themselves. What Liberia wants of the United States, its mother country, is that Secretary Knox will say to France, in the beautiful language of diplomacy, "Thus far shalt thou go—and no farther."

The Americo-Liberians have conducted their own affairs now for sixty years. During this time their internal troubles have been very slight, altho the country has never had a standing army. There is no hostility between the Liberians and the natives, excepting a trivial revolt on the part of a coast tribe where smuggling prevails. Furthermore, the former state of intermittent warfare among the powerful tribes was peaceably ended years ago. The Liberians insist that their present critical condition is due mainly to the aggression of nations too powerful to resist, and they seem anxious that the United States may understand that there is no turbulent element in their population. They consider themselves fully competent to conduct an orderly and prosperous republic if they

may have the diplomatic aid of America in their foreign relations, and its expert advice in certain departments of their domestic affairs.

It is our clear duty to give Liberia all the assistance she needs or will consent to receive. We took up the cause of Venezuela when we suspected, wrongly as it turned out, that the republic was being encroached upon, altho it threatened war with Great Britain. Here is a clearer case of boundary-shoving, and the injured republic is one for whose existence and prosperity we are responsible. Liberia was founded by the United States and has more than once been declared under our protection.

Democratic Illusions We are told that there was much enthusiasm at the recent meeting of the Democratic Congressional Committee in Washington because of a prevailing expectation that there would be a Democratic majority in the next Congress. These gentlemen deceive themselves. Their party's record during the present session will not induce a majority of the voters to look to it for a fair revision of the tariff, if this is what they have in mind. Moreover, it is quite well understood that the Republicans would have made a better revision if they had been restrained by the opposition of a consistent and united Democratic minority. The Democrats had an opportunity and failed to take advantage of it.

Does It Pay to Be Honest? The discharge from the Western Penitentiary in Pittsburgh of three men, convicted of assisting in the wrecking of the Enterprise National Bank there several years ago, and their almost immediate assumption of positions of trust, has caused a diversity of opinion as to whether or not it pays to be honest. Each of the three men served but half the sentence originally imposed in the United States District Court where they were tried, their sentences having been commuted by Presidents Roosevelt and Taft upon the pleas made by the wives of each of these men. Within the past three months the shortened terms of this trio have expired and they were all met at the doors of the prison by carriages and escorted to their former homes with

much ado. After a few days spent in quietude with their families two of them were given responsible positions in the heart of the city by persons who were swayed by their appeals that they had been misled by the former cashier of the wrecked bank, who chose to fill a suicide's grave rather than pay the penalty of his crimes at the altar of human justice. One of the men is now employed with a large real estate firm at a good salary; another is connected with a bank above that which he held prior to his fall with the failure of the bank, and the third is to assume a good position in the near future. While figures are not obtainable, it is generally understood that the trio will be earning more money in the new positions than its members did when they were working in the bank whose wrecking wiped out the entire fortunes of thousands of small depositors. While many of the depositors have been ruined financially for the rest of their lives, and have not yet received employment since they were thrown out of work when the financial crisis first struck Pittsburgh, these men, even tho they were the victims of unfortunate circumstances, walk into the largest institutions of the city and transact business at good salaries. In the district where the bank formerly stood the placing of these men in good positions after their release from prison on shortened terms is received with considerable hostility, for many of these persons have been forced to suffer privations and are now in almost destitute circumstances while the men who assisted in the spiriting away of their money own the homes in which they live and are employed at wages better than their victims ever received.

An Air Line from Calais to Dover

The silver streak, which has been England's protection against continental foes, has now been surpassed by a Frenchman. She put her trust in her wooden walls, latterly made of Harveyized steel, and has neglected the defense of the third dimension of space. The proposal brought forward from time to time to construct a tunnel under the Channel, a project undeniably practicable and profitable, has always been opposed by the military authorities because it

would endanger the safety of the island, but unless they roof over the whole country they cannot prevent any foreigner at any time from landing anywhere he likes. Of course there is no harm in a flying Frenchman or two. A German arriving at the Englishman's home in this unceremonious fashion would be a different thing entirely. Even on such aeroplanes as we now know Germans could be dropped *ad libitum* on English soil at a cost of a thousand dollars or so, but the German Government does not seem to care much for aeroplanes. It is going into the transportation business on a wholesale scale. By the end of the year the aerial navy of the Kaiser will consist of at least twelve airships, four of the Zeppelin and eight of the non-rigid type, and some of them can carry twenty-five men and sail a thousand miles. France has eight or nine. England has none and not even an aeroplane that will fly. She prefers old reliable "Dreadnoughts" to any new fangled notions. Even as a sport Englishmen do not seem to take an interest in flying. We Americans, having as yet no militant airships within range of us, do not worry about invasion and are only sorry to see our Wrights being beaten at their own game. But if it should turn out that M. Bleriot was not airsick in crossing the Channel the American tourist would be inclined to take the new route.

The Fall of Clemenceau

What a government we should have if a president were liable to be turned out of office when he lost his temper and made an unpleasant remark about a political opponent, and if the cabinet had to resign whenever there was a difference of opinion between the White House and the Capitol on any bill or executive measure. Our politics would be as dramatic and our administrative terms as brief as in France if we were under such a régime. The overthrow of Clemenceau a few days after he had received a vote of confidence does not indicate the instability of republican institutions in France or any important change in the policy of the Government. The last administration was the longest in the history of the republic, thirty-three months, and it had planned and in part carried out an extensive and consistent program

of financial, social and political reforms. When M. Clemenceau succeeded to M. Sarrien, whose right hand man he had been, it was hardly expected that he would last long. He did not take the trouble to move into the official residence provided for the Premier. "I came with an umbrella and I leave with a cane," he remarked gaily as he walked out of his office the other day. His reputation was that of a critic, a cynic and a malcontent. He had more than once overthrown a government; it was not anticipated that he could conduct one. During his administration it has been a favorite amusement of the opposition newspapers to reprint day after day embarrassing quotations from his old editorials expressing in the sharpest language iconoclastic and revolutionary, even anarchistic, sentiments. But once in office he has, without regard to verbal inconsistency, made it his first duty to maintain order and has kept an even balance between the warring factions of capital and labor. Once when he had called out the soldiers to prevent riots during a strike, one of his friends who had often been associated with him in anti-governmental demonstrations came to him to remonstrate against his policy, and, when he found he could not change him, charged him with abandoning his principles. "Ah, my friend," the Premier replied, "you must remember that we are not now on the same side of the barricade." But the good humor and common sense which have saved him in many a difficult situation failed him the other day when in a moment of irritation due, they say, to an attack of the liver complaint rather than to the attack of M. Delcassé, he let slip an offensive truth, and lost his place. Forty years ago M. Clemenceau was teaching French to the girls of Greenwich, Conn. Since then he has been engaged in other business. What he will do next cannot be predicted by his past career.

The Spanish and the Riffians

Spain in her scrap with Morocco is at the same disadvantage as an ordinary peaceable citizen when he undertakes a well-merited chastisement on the street loafer who insults him from the saloon corner. He does not like to fight and does not know how, while his

antagonist enjoys nothing more and has had plenty of practice. The Kabyles who are swarming around the Spanish outposts on the Riff coast are warriors by profession, as their ancestors have been from time immemorial. They regard it as time wasted when the temple of Janus is closed. They are not particular whom they fight, altho they naturally have a preference for an enemy of another faith with rich supply trains, rather than their fellow Moslems of the desert. But all civilized nations are beginning to be ashamed of war, or at least to regard it as an abnormal state, and an expensive and inconvenient operation. The Spanish have never conquered Morocco, while the Moors did conquer Spain. That makes a difference in the way it is looked at from opposite sides of the Strait of Gibraltar. It is no wonder that the Spanish people object to being burdened with more taxes to engage upon a war which will bring no glory and little profit if it is brought to a successful termination, but which is more likely to be interminable.

Loans to Countries South of Us

Costa Rica's contract with one of the great banks of New York for a loan to refund her entire foreign debt is a matter of much interest from the political, as well as from the financial, point of view. Costa Rica, the most peaceful of the five Central American republics, adjoins Panama, already under the influence of this country, and will gain something by the completion of the canal. In the past she has sought loans in London. Turning now to our bankers for the refunding of her debts, she thus indicates her confidence in them and in the just purposes of our Government. We are glad to observe further South other indications of such confidence. When the Bolivian Minister at Buenos Aires was expelled, last week, and the Argentine Minister at La Paz was recalled, the interests of the two estranged Governments were turned over to the American Ministers in the two capitals, and not to representatives of European countries. There is said to have been no precedent for this action. It is quite probable that the influence of our Ministers will bring about a peaceful settle-

ment of the controversy. We presume that Costa Rica was moved by the evidence of our just and highly successful management of Santo Domingo's foreign obligations. Negotiations are pending for a refunding of the foreign debt of Honduras by a New York syndicate. This debt is much larger than Costa Rica's (exceeding \$100,000,000) and Honduras has been by no means a stable and orderly republic. If her foreign obligations should be refunded here, however, Honduras would be more amenable to the restraining influence of the United States and less exposed to the disturbing projects of the ambitious President of Nicaragua. This refunding is to be desired for the promotion of peace in a part of the world where our interests will grow as the years pass. These events, together with the reported purpose of Uruguay to invite participation here in a loan of \$6,000,000 for public works, point to the development of New York in the near future as one of the world's great loan markets.

Unemployment Insurance

A practical experiment with insurance for the unemployed in winter has been made in the German city of Cologne. The purpose of this institution of social welfare is to save the honest, industrious laborer from becoming an object of charity. In 1908-09 the membership fee of \$6 a year was paid by 1,957 persons. The city of Cologne contributed \$5,000, and some public-spirited citizens about \$600. It is but natural that those who take advantage of this institution are mostly people who have reason to fear that they will lose their positions. And thus it turned out. Of the 1,957 members, 1,485 lost their employment. It is, of course, the first task of the association to secure work for its members thru its employment agency. It succeeded in getting permanent engagements for only 48 numbers, so that 1,433 had to receive their daily allowances. But for 1,159 of these part-time employment was found, so that only 37,971 day allowances had to be paid, instead of 62,860. The annual contributions from the different sources were not sufficient to meet the expenditures, and a deficiency of about \$3,000 had to be

covered out of the assets. These are now \$32,000. This insurance does not provide for times of unforeseen business depression, but considers those occupations which are naturally less in demand in winter. This brings in a certain regularity. But it is by such private experiments, gradually expanding their sphere of activity, by which this new social welfare movement must gather experiences, that the foundation must be laid for future legislation. From this point of view the far-sighted enterprise of the public-spirited citizens of Cologne will be carefully watched by all sociologists. The beginnings are very encouraging.

It seems a curious fact that the Presbyterian synods of the United States sent no representative to the Calvin celebration at Geneva last week, tho Princeton sent President Patten, and Union Professor Briggs. The prominent lay figure from *outré mer* was Governor Guild, of Massachusetts—a devout Unitarian, whom John Calvin would have treated to the fate of Servetus. The prominence of Catholics at the university jubilee was notable. Comte d'Haussonville, an Ultramontane of the strictest sect, represented the French Academy. The paper of Professor Frederic, of Ghent, in the *Journal de Genève*, claims Calvin as the father of every sort of modern republicanism. We fear the reformer of Geneva would not be willing to be held responsible for everything that is now done in the name of republicanism.

Almost every morning now in this vacation season the papers recount some appalling automobile accident, resulting in death. At least nine times out of ten the cause of the accident is overspeeding or reckless driving. If any one is punished it is generally the chauffeur, who is equipped with a moderate fine, and whose guilt mostly consists in obeying the orders of his employer. Manifestly this does little good. The owner and not the chauffeur should be imprisoned for all serious accidents and his license to own an automobile revoked for all reckless or felonious offences. Which State will be the first to hold the owner of the automobile responsible? The arguments

for employers' liability apply just as cogently in the case of the running of an automobile as a factory.

Is Harvard going to replace Chicago as the center of sensationalism? A writer in the *Transcript* thus summarizes the most recent emanations from America's oldest seat of learning:

That Mars carries passengers. That folks can talk to them with looking-glasses. That alcohol is the only reliable foundation for morality. That laboring men are the privileged class. That in reading for fifteen minutes a day any man may possess himself of a liberal education. That the dead can communicate with the living.

The National Civic Federation is going to call a great conference in Washington next January to discuss uniform State laws. No doubt we need more uniformity in legislation; nevertheless the States can make social and political experiments on a small scale that would scarcely ever be made if we had to wait for uniform laws.

We congratulate Galveston on the possession of a sea wall that has protected it from the gulf waves, and we congratulate the city still more on the possession of the commission government which has constructed the sea wall and set an example of municipal efficiency and foresight for other cities of the country.

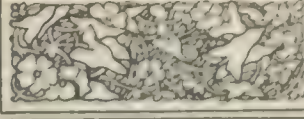

The colleges have been getting hard knocks from all sides and the worst is to come if there is any truth in the rumor that the Yale investigations prove athletics to be injurious. If the colleges do not give good training in this branch what do they do?

Once again the wish of the poet has become an actuality. President Taft, when he watched the moving pictures reproducing his speechmaking, came near to seeing himself as others see him, probably as near as Burns would have liked it for himself.

It is one of the symptoms of the ineradicable depravity of nature that when a watermelon is cut the thick part of the wedge is on the rind side.

Insurance

The Equitable's Birthday

ON July 25, 1859; the Equitable Life Assurance Society was born. On July 28, its first day of business, fourteen policies were issued covering insurance of \$100,500. The capital of the company was \$100,000, and it began work in a small back room on the second floor of a building at 98 Broadway, which it leased for \$450. It was not till over a year that the first clerk was employed.

This week the Equitable celebrates its fiftieth birthday with a convention which will be attended by 500 of its more important agents from all over the country, who will consult together and hear the inspiring story of what has been done and therefore can again be done by resolute men in fifty years.

There is no need to recount the phenomenal growth of the Equitable; everybody knows it. Suffice it to say that among all the nations the United States leads in finance and in the United States we recall no single financial institution that has had a more successful career as success is counted. Amidst panic and disaster its solvency has never been questioned and it has already returned to its policy holders or holds in trust for them nearly \$40,000,000 more than it has received from them in premiums.

Success, however, is not always an unqualified advantage. Success brings with it temptations many and insidious. The recent insurance scandals, which started in the Equitable and spread to some of the other companies, prove this. But the exposures have been, we are confident, worth all they cost and will prove of lasting benefit to the insurance business as well as to those other great financial institutions whose officers were seeming to forget that they were after all only trustees of other people's wealth.

While no doubt there are economies and improvements yet to be made in the Equitable—it would be unfortunate if there were not—still we wish to congratulate President Morton and his colleagues for the reforms they have inaugurated and are so successfully carrying

out. We confidently believe the great company was never better managed than it is today, and we know that it is as safe to put money in as Government bonds. There is every reason therefore why it should have as great a success in the next fifty years as in the past, and so long at least as the present administration is in control such success, we think, can reasonably be predicted.

WHEN a man has taken out a life insurance policy for the benefit of his family he ought not to trench upon this insurance by borrowing lightly on his policy. In the old days this was never done, but in this age of rapid living, borrowing on the life insurance policy is becoming far too frequent. Every time this is done, the protection signified by the policy is reduced by the amount of the loan. Sometimes the policy must be used as collateral for a loan, but in all such cases the loan ought to be paid off as soon as possible, as the wife and children will need every cent of the insurance in case the breadwinner dies, no matter how much it may be.

A GREAT many persons have left their winter homes on their annual vacations. Others will presently go away in quest of that rest and variety that comes from a change of scene and freedom from routine occupation. In many cases the householder closes his town house and hastens to the seaside, to the mountains or goes a-touring. Then is the opportunity of the yeggman. He resembles the busy bee in his improvement of the shining hour. Then the householder returns to find confusion and robbery in his dwelling. His belongings have been taken away and his home appears only too desolate after the burglars have come and gone. An unoccupied house affords many opportunities for spoliation, and a burglary and theft insurance policy is a most excellent protection that it seems ought to be contemporaneous with a summer holiday, either of long or short duration.

Exchange Reforms

THE first fruits of the investigation of the Exchanges by the commission which Governor Hughes appointed are seen in provision for actual trading at the Metal Exchange and in the abolition of the Stock Exchange's unlisted department. At the Metal Exchange prices have been determined by a small committee and not by actual sales of copper, lead, tin or spelter. This was disapproved by the investigators, who recommended that the Exchange's charter be repealed. The governing board of the Exchange decided last week that, beginning on August 2, the quoted prices shall be those made by actual transactions. Elaborate rules were adopted, these substantially conforming to those of the Metal Exchange in London. For copper, the trade unit is to be 25 tons. As 75 per cent. of the world's output of copper is taken from American mines, there should be trading enough in this metal here to make quotations that will represent actual transactions.

Abolition of the Stock Exchange's unlisted department is deferred until April 1, but only to give corporations now in that department ample time to go on the regular list, if they desire to do so. Corporations capitalized at more than \$500,000,000 are affected by this commendable decision of the governing authorities of the Stock Exchange, among them the Amalgamated Copper, Anaconda Copper, American Woolen, American Linseed Oil and Distillers' Securities companies. Transactions in two of them last week amounted to 180,000 shares. The number of companies in this department has recently been reduced by the transfer to the regular list of American Sugar, American Smelting and Refining, National Lead and several other large corporations.

The unlisted department was established for a proper purpose, but it soon became a refuge for companies that were unwilling to make the reports required from those on the regular list. A corporation on that list must publish annual reports and must furnish to the Exchange

authorities a detailed description of its property, a schedule of assets and liabilities, and a statement of capitalization and indebtedness. Reports of daily transactions in unlisted shares have been misleading to the general public, because there was nothing to indicate the lack of requirements for the protection of buyers. The investigating commission recommended that the department be abolished, and it will soon be discontinued.

The Upward Movement

THE wages of 3,000 motormen and conductors of the Interstate Railways Company, whose lines are in Eastern Pennsylvania, New Jersey and Delaware, were unexpectedly increased last week, and the salaries and wages paid by the Erie Railroad Company were raised to the rates prevailing prior to last January. In the steel trade increasing activity was reported, with rising prices for pig iron and steel billets. The weekly output of coke in the Connellsville field is now 320,000 tons, against about 250,000 before the middle of May. The Republic Iron and Steel Company gives notice that it will pay, in instalments, the accumulation of unpaid dividends (6½ per cent.) on its \$20,000,000 of preferred stock. The Steel Corporation has authorized the expenditure of about \$2,000,000 for an enlargement of its works at Lorain.

... The tenth annual issue of that useful book of reference, the "Directory of Directors in New York," has just come from the press. It contains the names of more than 32,000 directors; information as to all the companies with which each is connected; lists of corporations in banking, insurance, transportation, manufactures, etc., accompanied by the names of officers and directors; and lists of the principal Exchanges, with names of officers and managers. The book has been carefully prepared, and its contents are conveniently arranged. It has come to be an indispensable part of the business man's working library.

Survey of the World

Tariff Bill Passed in the House

The Tariff bill, as reported by the conference committee, was passed in the House last Saturday evening by a vote of 195 to 183. Two Democrats, Messrs. Broussard and Estopinal, both of Louisiana, voted for it. Nineteen Republicans, as follows, were counted in the negative:

Minnesota—Davis, Lindbergh, Miller, Nye, Steenerson, Stevens, Volstead; *Wisconsin*—Carey, Lenroot, Nelson; *Iowa*—Haugen, Hubbard, Woods; *Kansas*—Murdock; *North Dakota*—Gronna; *Ohio*—Keifer; *Washington*—Poindexter; *Illinois*—Mann; *New York*—Southwick.

Upon a motion to recommit the supporters of the bill had a margin of only five votes (186 to 191), and the motion would have been carried if all the Democrats, those absent without pairs included, had voted for it. The motion was made by Mr. Payne, who did not wish to see it adopted. By making it he forestalled a similar Democratic motion, which would have specified instructions to the committee. The debate was limited by a special rule, which was adopted with scarcely any opposition. This rule excluded points of order against provisions of the reported bill. In this way the House overcame the difficulty presented by the committee's adoption of shoe and leather duties lower than those for which either the Senate or the House had voted. At the beginning of the debate, Mr. Dalzell urged the Republicans to accept the report and thus open a new era of prosperity. Mr. Payne asserted that it fully satisfied all the pledges of the party and of the President. Defending the new tax on corporation net earnings, Mr. Longworth said that the President had been primarily re-

sponsible for it. Mr. Mann (Republican) opposed the bill because of its provisions concerning wood pulp and print paper. He asserted that the maximum rate would be enforced against Canada and that in this way the duty on wood pulp would be increased from \$1.75 to \$6.75 per ton. Mr. Clark, the Democratic leader, said the President had been deceived and imposed upon. He produced a table showing that the bill increased the Dingley average ad valorem rate by at least 1.71 per cent. The President, he added, had exercised a potent influence with respect to certain rates, and could have accomplished much more if he had begun his work at an earlier day. Other Democrats questioned the President's sincerity as an advocate of downward revision. It is expected that the committee's report will be accepted in the Senate before the end of this week.—The committee reached a final agreement on the 29th. Up to the last day, Mr. Taft had insisted upon free hides and certain other changes. As the committee was not inclined to report in accord with his views, he sent to Mr. Payne on the 29th a letter in which these views concerning rough lumber, gloves and hosiery were clearly set forth. This caused action with which he is said to be satisfied. His remarks to visitors and journalists at the beginning of the week, however, had shown that he had no veto in mind. He then defended the bill in the main, and, if published reports are correct, held that the purpose of the revision should be to prevent an increase of present prices, rather than to cause a reduction of them. At first he had asked for free hides, petroleum, coal and iron ore. In the bill as reported and

passed, hides and petroleum were made free, but duties of 15 cents on ore and 45 cents on coal were retained. The bill makes the net earnings tax 1 per cent. and gives authority for an issue of \$290,569,000 of Panama Canal bonds, at 3 per cent. It also contains the Senate's provisions for maximum rates and for a Customs Court. Mr. Payne's report of the conference committee's work to the House was accompanied by a long and elaborate review and defense. In a tabular statement he used as a basis for comparisons not the imports of dutiable goods and the values on them, but the values of the leading commodities consumed, whether produced at home or abroad.

Labor Disputes

There was no settlement, last week, of the controversy of the Pressed Steel Car Company with its employees at McKee's Rocks, Pa. In riots which took place on the 26th several persons were shot by deputies, but no one was mortally wounded. On the 31st, the company's president for the first time consented to deal with a committee representing the strikers, and some expected that an agreement would soon be reached. The company, however, regards with so much dissatisfaction the hostile attitude of the people of McKee's Rocks and of the local press that it will probably move its works westward. Friends of President Hoffstot say that the additional factory which was to have been erected at McKee's Rocks, at a cost of \$2,500,000, will be built in Chicago, and that the present plant, representing an investment of \$5,000,000, will be dismantled.

—At Elwood Ind. Judge Baker, of the Federal Court, has denied the application of the American Sheet and Tin Plate Company (a subsidiary of the Steel Corporation) for an injunction to restrain its employees who are on strike against an open shop, saying that the strikers have a right to organize, to quit work, and to maintain pickets so long as they do not interfere with the company's access to the labor market. The company, in a published review of its operations since July 1, says that the number of its mills in use has increased

from 113 to 124 in the sheet department, and from 80 to 114 in the tin plate department, since the beginning of the strike. The statement indicates that the strike is a failure.—In Chicago, the street railway motormen and conductors have sought concessions from their employers. These having been refused, special meetings were called by the union leaders at the beginning of the present week, and some predict that a general strike will be ordered.—All differences between the Pittsburgh Coal Company and its employees have been amicably adjusted by President Lewis, of the United Mine Workers, who says that the recent short strike of 15,000 of the company's miners was ordered by the local officers of the union without sufficient reason.

Riots and Earthquakes in Mexico

There were political riots of an alarming character on the 25th and 26th in Guadalajara, the second city of Mexico. President Diaz is a candidate for re-election, and he desires the re-election of the present Vice-President, Ramon Corral. Many of the people prefer General Bernardo Reyes, formerly Minister of War and now Governor of Nuevo Leon. The riots were in his interest and against the Diaz Government. They began when the Reyistas, as they are called, attacked and broke up a political meeting which was to be addressed by prominent supporters of Diaz and Corral. The mob, shouting "Down with Diaz," afterward wrecked the hotel where the imported political orators had found shelter. Troops were called out, and in suppressing the riots seven persons were killed and thirty-five wounded. Two hundred arrests were made. General Reyes expresses much regret and says he does not seek office. He is friendly to American interests, but supporters of Corral sharply attack Americans, asserting that they are obtaining control of Mexico's lands, mines, railroads and manufactures—

An area of 1,000 square miles lying south of the capital was shaken by earthquakes on the 30th and 31st. Chilpancingo, wrecked by earthquake two years ago, was partly destroyed. There was also

great loss in Acapulco and several other cities. At Acapulco a tidal wave followed the first shock, and it is said that the fine harbor there has been injured by upheavals. It is estimated that 500 persons were killed. The shocks were felt in Mexico City, where the Cathedral suffered so much injury that it has been condemned.

Cuba and Porto Rico

To facilitate a reorganization of the Cuban Cabinet, all the Ministers except one resigned on the 29th. Two or three had become decidedly unpopular, and changes were required in order that the two factions of the dominant party might work together in peace. Two days later, the retiring Postmaster-General, Señor Nodarse, went to the house of Señor Torriente, the editor of a satirical weekly, and shot him because of an offensive cartoon he had published.—Dr. Guiteras, the well-known sanitary expert, has resigned as chief of the Havana Health Department, saying that inadequate appropriations make him unwilling to be responsible for the exclusion of yellow fever.—Gustavo Alonzo, lawyer and journalist, has been appointed director of Cuba's new national lottery. This is the office which was given up by Morua Delgado, the negro ex-president of the Senate, when he learned that all his subordinates had already been appointed by the Secretary of the Treasury. With three drawings a month, the Government expects that the lottery's annual receipts will be \$8,000,000, yielding a profit of \$2,000,000. Large orders for tickets have already been received from the United States, and it is said in Havana that local brokers will try to fill them, altho efforts to exclude the tickets will be made by our postal authorities.—William F. Willoughby, of Virginia, who has held office in Porto Rico since 1901, first as Treasurer and recently as Secretary of State and President of the Executive Council, has been appointed Assistant Director of the Census, at Washington.—The leaders of the dominant party in Porto Rico have asked the courts for an injunction to restrain the executive officers from making expenditures under the recent act of Congress,

which duplicates the appropriations made for last year.

At the end of the trial, in Pacific Islands Honolulu, of thirteen Japanese laborers who were leaders of the recent strike riots, the jury disagreed, standing seven for conviction and five for acquittal. Hawaiian sugar planters have decided to make the experiment of importing laborers from Russia. A Russian capitalist, now in Honolulu, has offered to assist, and forty Russian families will be placed upon one of the plantations.—A party of about twenty-five United States Senators and Representatives will visit the Hawaiian Islands, in response to a recent invitation from the insular Legislature, sailing from San Francisco on August 24.—Jikiri, the Moro outlaw whose band in the Philippines was recently exterminated, had sworn to kill one hundred men during his life. When he was killed by the soldiers he had nearly a hundred on his list of victims.

Affairs in South America

General Rafael Reyes, President of Colombia, now in Europe, sent his resignation to Bogota last week, and the Colombian Congress accepted it by unanimous vote. He says he intends to remain in Europe, where, it is reported, he will become a partner in a firm of bankers. Congress decided that there should be an election on August 3 to fill the vacancy for the remaining year of his term. An election was offered by cable to Señor Molina, formerly Minister of Finance, who is in London, but he declined. Like General Valencia, he prefers to be candidate for the full term, a year hence.—The quarrel about the arbitrator's award relating to the territory of Acre has been marked by no further hostile action. Argentina has adopted a waiting policy. At the capitals of Bolivia and Peru a peaceful settlement is predicted. There are indications that Chile has encouraged Bolivia to reject the award. Peru's Foreign Minister has published copies of telegrams which recently passed between Bolivia's Government and the Bolivian representative at Santiago. These appear to prove that Chile, while

urging that Argentina should be appeased, has encouraged Bolivia to stand out against Peru, even to the point of war. It is asserted that Chile offered to aid Bolivia with money and arms.—In New York representatives of President Cabrera, of Guatemala, recently asked for the arrest of Edwin Emerson, a writer, on a charge of criminal libel, because in an article contributed to an American magazine he had drawn a revolting picture of Cabrera, asserting that he was a tyrant, guilty of many crimes. There was a hearing in court, and several witnesses for Emerson testified in confirmation of his assertions. By instructions received from Cabrera, the application for Emerson's arrest was withdrawn on the 30th, and the case was dropped. Emerson protested against this, saying he had arranged for the testimony of other and important witnesses.

The Wrights Triumph

When the Government specifications for an aeroplane were drawn up over a year ago they were far in advance of anything that had been accomplished and believed by many to be impossible of fulfilment. The stipulations which the Wright brothers agreed to meet were that the flying machine should carry a passenger for an hour in the air and that it should make a cross-country flight of not less than five miles and return without stopping, at an average rate of 40 miles an hour. The efforts made by Orville Wright to accomplish these feats at Fort Myer last year were checked by the falling of the machine, causing the death of the passenger and the injury of the aviator. This year the trials were repeated at the same place and the Government conditions were met. On July 27, Orville Wright, carrying Lieutenant Frank P. Lahm, of the Signal Corps, as passenger, flew around the parade ground for an hour and thirteen minutes, thus establishing a new long-distance record, a little ahead of that of his brother at Le Mans, France. On July 30, Orville Wright, with Lieutenant Foulis, made a flight to Shuter's Hill, near Alexandria, and return, over a rough and hilly country, where it would have been very dangerous to have landed if any-

thing had happened to the machine. The average time made was $42\frac{1}{2}$ miles an hour, tho on the return trip the rate was more than 47 miles an hour. Some time was lost by the aeroplane dropping into the valleys between the hills and having to rise again, and in being carried by a cross-wind to one side of the balloon which marked the end of the course. In crossing Four Mile Run, the aeroplane was at a height of nearly 500 feet. The Government agreed to purchase the aeroplane at \$25,000, with a bonus of \$2,500 for every mile of speed made above 40 an hour. This will give the Wrights, therefore, a price of \$30,000.—A new world record with the aeroplane was made by Roger Sommer in a Farman biplane at Chalons, by remaining in the air an hour and fifty minutes, at an average height of 80 feet.—Hubert Latham made a second attempt to fly across the English Channel, expecting to descend at London. He had almost accomplished the passage and was within two miles of Dover when his engine failed as before and he dropped into the sea, slightly injuring himself by the fall.—Many entries have been made for the aeronautic contest at Rheims for the week of August 22. Fifteen aeroplanists will contest for the prizes, America being represented by Glenn H. Curtiss. Prizes are offered for speed, for height, for endurance and for number of passengers carried.

Rioting in Barcelona

As the news of the disastrous defeat and slaughter of the Spanish troops on the Riff coast leaked out, the opposition to the war in Morocco increased all over Spain, and in many places the calling out of the reserves was the occasion of mutiny and riot. The most serious disturbances were in Catalonia, the industrial section of Spain, where revolutionary tendencies have manifested themselves with increasing frequency of late. It has been a gathering place for Carlists, Anti-Clericals, Republicans, Laborites, Socialists and Anarchists, who are agreed in their opposition to the Government, however much they may differ in other respects. It seems to have been a spontaneous combustion of all these inflammable elements of its heterogeneous population which set Barcelona in flames

last week. In how far and by whom the rebellious movement was organized is not yet clear, for the censorship has been strict and no authentic details of the disorders have been made public. It is naturally to be suspected that the Carlists, the strongest anti-dynastic party, had a hand in it in order to give a chance to the young pretender, Don Jaime, who recently succeeded to the claims of his father, Don Carlos, but the Carlists are strongly clerical, while the mob of Barcelona directed its fury primarily against the churches and convents. The outbreak began on Monday with the declaration of a general strike. Shops were closed, the streets barricaded, and communication with the rest of the country cut off by the destruction of railroads and bridges by dynamite. The civil authorities were powerless and the country had been drained of its troops for the Moroccan campaign. At the most 8,000 soldiers could be mustered to protect the city and of these many refused to fire on the mob. Churches were sacked and burned, the priests being hunted thru the streets or murdered at the steps of the altar. The convents and parochial schools of the city and vicinity were most of them destroyed. The nuns who tried to escape from the burning buildings were driven back into the flames by the stoning of the surrounding mob. As in the Paris Commune, women took an active part in the work of incendiarism and in the defense of the houses and barricades against the military. A mob of 10,000 marched thru the streets singing the "Marseillaise" and bearing aloft on their pikes the heads and charred limbs of nuns and priests. The Government declared martial law in the disaffected provinces and later extended it to the whole country. The troops in Barcelona were reinforced and by the aid of artillery and cavalry gradually gained control of the streets, driving the mob from barricade to barricade. The military governor was instructed "to act pitilessly," and it appears that he carried out his instructions literally. Court martials were in continuous session on Friday and Saturday and it is said that over a hundred of the prisoners were condemned and executed. The number who

fell in the street fighting is estimated at two or three thousand. According to the latest reports the city is subdued, but the republican flag is still flying in many of the towns of Catalonia, and it will be a difficult task to restore order to the whole province.

The War in Morocco

The only news from the Riff Coast comes thru Spanish official sources and is so cautiously censored that no accurate idea of the situation can be obtained, but it is apparent from what has been given out that the Spanish suffered during the fighting of the last of July much more severely than was at first supposed. The railroad line running from Melilla to the mines was cut by the Moors on July 27. Several hundred yards of the track was torn up. In the effort to restore communication with the outpost a convoy was sent out under General Pintos. In passing thru a defile in the mountains the Spanish troops were attacked on both sides by Kabyles in ambush and were driven back with a terrific slaughter. General Pintos, three colonels, two captains, twenty-two other officers and a thousand men were killed. The wounded number at least 1,500. The hippodrome has been converted into a hospital and is overcrowded. The retreat, it appears, was a disorderly race for shelter, every man for himself. One of the colonels was killed at his own request by a private rather than fall into the hands of the enemy for torture. Some of the Spanish soldiers refused to fight and others insisted upon placing their officers in the firing line, which accounts for the heavy mortality among the officers. General Marina has now about 24,000 troops at Melilla, but states that he must have 75,000 men before he attempts any advance movement against the Moors. Spanish gunboats take part in the fighting by long-range bombardment and endeavor without much success to prevent the blockade runners from supplying the natives with ammunition. An army of 6,000 Moors is reported to have attacked the island fortress of Alhucemas, on the coast, five miles east of Cape Morro, and thirty-five miles west of Melilla. The Sultan of Morocco, Mulai Hafid, refuses

to intervene in favor of the Spanish, for the Kabyles in their most peaceful moments have been reluctant to acknowledge his supremacy, and the Sultan has never agreed to the mining concession which the Spanish Government obtained from the local authorities and is now endeavoring to hold by force of arms.

Foreign Notes

The evacuation of Crete by the protecting Powers—Great Britain, France, Italy and Russia, took place on July 25, according to the program. The four flags were hauled down and the troops embarked. Each of the Powers will maintain a warship in Suda Bay for the present.—The Ministry of M. Briand was accepted by the French Chamber of Deputies by a vote of confidence of 306 to 46. The new Premier stated his policy in a practical, straightforward manner which made a good impression. He emphasized the necessity of peaceful, orderly progress and said:

"In the forefront of the preoccupations of the Government is the voting of the budget. Regarding social legislation the Government will endeavor to realize before the end of the present Parliament the scheme for workmen's pensions. It will then extend a complete system of social insurance to the agricultural, commercial and industrial workers."

The French courts have decided in favor of the contention of the Government that employees of the state are not entitled to form militant unions. Sixteen employees of the Department of Posts and Telegraphs, who during the recent strike applied for legalization of such a union, were fined \$3.20 each and the union ordered dissolved.—Osaka, one of the most important manufacturing cities of Japan, was destroyed by fire on July 31. The greater part of the city was composed of wooden buildings placed close together and on account of the high wind and the draft, it was impossible to check the conflagration after it had once made headway. The devastated area is over four miles square and among the buildings destroyed are the stock exchange, factories and the famous Buddhist temple.—The prompt and unconventional action of President Taft in telegraphing directly to the Regent, Prince Chun, asking for a share

in the proposed foreign loan, has created a great deal of excitement in China and in European financial circles. The French, German and British bankers who have completed the arrangements for the loan have offered American financiers a part in it, but are unwilling to admit them to an equal share and privileges. The German Bank in Peking is urging the Chinese authorities to sign the papers without regard to the American protest.—The British Government has succumbed to the demand for a larger navy, and on July 26 Reginald McKenna, First Lord of the Admiralty, announced that the construction of four new Dreadnoughts, which was left optional, will be undertaken at once. The referendum taken by the Miners' Confederation of Great Britain, decided in favor of a national strike by a vote of 518,361 for and 62,980 against the strike. The date for the English strike is fixed for September 1. The Scotch colliers, however, in whose support the strike is ordered, may leave work immediately and will receive \$2.50 a week from the Confederation. The question in dispute is the proposed reduction in the Scotch coal mines of 12 cents a day on the present rate of wages of \$1.50. Madar Lal Dhingra, the Indian student who killed Sir Curzon Wylie and Dr. Lalcaca, was found guilty and sentenced to death in a trial of less than an hour at the Old Bailey Police Court. The prisoner made no defense except to claim that he was inspired by patriotic motives and was proud to have the honor of laying down his life for his country. A. F. Horsley, who printed the *Indian Sociologist*, was sentenced to four months' imprisonment for publishing a seditious newspaper.—The Czar of Russia, paying an official visit to France on the yacht "Standart," landed at Cherbourg with the Czarina and took tea with President Fallières at the central fort. On account of the animosity shown to the Czar by the French radicals on the occasion of his visit and the danger of an attempt at assassination, the "Standart" is surrounded by a double ring of naval vessels and the city is filled with detectives and police. Similar precaution will be taken when the Czar goes to England on August 2.

GREAT AMERICAN UNIVERSITIES—VIII.

Minnesota Stockman

THE MINNESOTA STOCKMAN

UNIVERSITY *of* MINNESOTA

MINNESOTA
FARM REVIEW

by EDWIN E. SLOSSON

THIS is the great seal of the University of Minnesota. The field is quartered and equal space assigned to the lamp representing the humanities, the telescope representing pure science, the plow representing applied science, and the palette and brushes representing the fine arts. But heraldry is as fallacious a guide to character as palmistry, and, if the arms of the University of Minnesota are to convey a correct impression of the institution as it now is, they should be changed to the following design: The plow very large, the telescope small, the lamp still smaller, and the palette altogether absent.

This unsymmetrical development, characteristic to some extent of the State universities generally, should not be too hastily condemned. It is rather creditable and encouraging than otherwise, because it indicates that the universities that have gone West have grown up with the country, devoting themselves rightly, tho too exclusively, to the primary and immediate needs

of the locality. The fact that the State universities have their roots deep in the soil is the best assurance that they will maintain a stable growth and in due time blossom in art and be fruitful in new knowledge.

The question arises whether that time is not now due, whether the State universities are not now big enough and rich enough and old enough to demonstrate their ability to cultivate the more recondite and less obviously useful branches as successfully as do endowed institutions. This is fundamentally a question whether art, literature and science in their highest forms can thrive under a democratic régime or must have patronistic support. In undergraduate instruction the State universities have proved their competency. In creative work their capability is still disputable.

The realization that the State university is now on trial and must demonstrate its equality with other institutions in this respect or cease to claim it, has led, in the last few years, to a determined effort on the part of many of them to secure recognition and support for research as an essential function of the university. This effort has resulted in the organization of graduate schools, the foundation of research fellowships, and in a few cases professorships, the publication of periodicals and series of

monographs, the enlargement of libraries, and the appropriation of money openly and specifically for research. Such investigation as had been previously carried on in Western universities had been due to the initiative and energy of individuals, for which the university authorities deserved little credit and indeed were not inclined to claim any. The regents generally regarded scientific research as a private fad of a professor, like collecting etchings or playing the piano, and they rarely interfered with it so long as he delivered full tale of teaching and administration and did not ask for money. The signal exception to this attitude has been agriculture, where the money came from the Federal instead of State government. The experiment station funds were given explicitly for research and the influence of the United States Department of Agriculture, exerted thru the Office of Experiment Stations, has been to check the tendency to spend the money on teaching, demonstration and trivial experimentation, and to encourage the station men to attack difficult and fundamental problems of biology and chemistry, even tho the practical results were remote and doubtful. And now original research along agricultural lines is further endowed by the Adams Act of 1906, which appropriates \$30,000 a year to each State specifically for that purpose. It happens that new methods of experimentation have been recently developed that open out attractive and hitherto impenetrable fields of investigation, such as heredity and physiological chemistry, whose scientific value, in my opinion, is not lessened by the fact that they have a most important bearing upon human life and industries. I said "it happens," but there is nothing accidental about it. It always happens so when a determined and persistent attack is made on any of Nature's businesses.

The impulse for research in the collegiate departments in the State universities came from two directions, by convection from the Eastern institutions, primarily Johns Hopkins, and by conduction from the agricultural experiment station where this formed a part of the university. In Minnesota comparatively little has been done in re-

search except in the agricultural department until recently. The graduate school was first definitely organized in 1905, and then the regents permitted it only on condition that it was not to cost anything.

The apparent backwardness of Minnesota in this, as in some other respects, is easily understood when we consider its youth and rapid growth. More than half its alumni have been graduated in the last five years. Every building on the campus has been erected since President Northrop took control twenty-five years ago.

The character of State universities may in fact be told pretty closely by their age, for in their life history they are much alike. This may be diagrammatically exprest as follows: First a college or academy of the Eastern type is transplanted to Western wilds, usually under denominational auspices; it struggles for existence in the unfriendly environment; the State adopts it; it receives extensive but unproductive endowments in land, and these are mostly sacrificed in the effort to keep up expenses; the State comes to the rescue with small but regular appropriations; an agricultural college is established by the Morrill Act of 1868, either as an ally or a rival of the State university; the university in the late eighties begins spontaneously to grow in geometrical progression; professional schools, especially engineering, develop; the connection with the State becomes closer; the institution takes on new functions, receives unprecedentedly liberal appropriations, and becomes conscious that it is a real university, with all the honors and responsibilities that come with maturity. Into this outline sketch might be painted the portrait of almost any of the State universities of the West.

As Prof. Guido Marx has shown,* the curves representing the number of students are astonishingly similar in the case of American institutions of higher education, whatever their character and location. There is a normal increase in attendance corresponding to the growth in population until about 1885, when the curve takes a sudden leap upward, and in the case of the State universities as-

*Science, May 14, 1909.

sumes a parabolic form. The curve for German universities shows the same peculiarity, with the sudden upward bend occurring at 1871. This is easily referable to the consolidation of the empire, but in the United States there was

asked in different universities why the attendance increased suddenly along in the latter half of the eighties, I have been referred to some change in the local conditions. "Oh, that was when we got a new president," or "That was the year

CYRUS NORTHROP,
President of the University of Minnesota

no such political revolution in 1885, and I have not found any one who could explain satisfactorily why a boom in higher education should have struck the country at that particular time. Where I have

of the big corn crop," or "The new school law came into effect then," or "The Legislature was unusually generous." But there is only two or three years difference between Harvard and

California in the date when the curve starts upward, and it is obvious that when Eastern and Western institutions, private and public, high schools and universities, classical colleges and technological schools, are affected almost simultaneously in the same way, the fundamental cause must be a general, not a local one.

There is, however, a marked difference between the Eastern endowed and the Western State universities. The growth which started in both classes of institutions about the same time has

of maturity, not on its size, and this, as I said, can be told approximately by its age. The four large universities of the Middle West seem to many people very much alike; in fact, hardly to be distinguished, but they are readily classified by their date of foundation:

University of Michigan	1817
University of Wisconsin	1848
University of Illinois	1867
University of Minnesota	1868

The oldest of these, the University of Michigan, is growing as fast as the others, but has assumed a more mature and

J. E. LIBRARY, UNIVERSITY OF MINNESOTA

been in most cases slackened or checked in the former, while in the latter it has been continuously accelerated, and its limit is not yet in sight. There is a period in the life of a boy when his development seems purely physical. For a few years he does nothing but grow. This period, called by paidologists "the adolescent plateau," has its counterpart in the life of a State university, and in comparing them with the more mature Eastern institutions this must be borne in mind. The character of a State university depends primarily on its stage

defined character. I do not mean to say that it has reached the limit of its powers and settled down to a quiet and peaceful old age. On the contrary I ascribe its comparative inactivity in recent years to the accidental dominance of the *genru* or Elder Statesmen, and I believe that it will develop greatly in the near future. The University of Wisconsin, younger than Michigan and smallest of the four, has in some respects outstripped the rest, and has certainly passed thru its period of immaturity. The universities of Illinois and Minnesota being practically of

the same age are more alike than the rest, for they are in about the same stage of evolution. They are, in fact, just emerging from the adolescent plateau, and actually remind the visitor of a lusty and overgrown youth whose clothes are too small for him, who has not full control over his voice and limbs, and who has not quite decided whether to be a preacher or a pirate or a locomotive engineer.

But dropping such fanciful impressions and getting down to plain figures, the University of Minnesota is third in size of the universities of the United States. The registration last fall was as follows, leaving out the summer students as of uncertain status:

Michigan	4,637
Columbia	4,540
Minnesota	4,355
Harvard	4,336

If we take academic students alone Minnesota is still third, with Harvard and Michigan above it. In the last twenty years the attendance at the University of Minnesota has increased more than twelve times as fast as the population of the State. Its law, medical and agricultural schools have gained more students in the last six years than any other of the fourteen universities here considered.

In considering enrollment statistics we must take them for just what they mean, no more, no less. A university of 4,000 is influencing directly twice as many persons as one of 2,000. It has double the chance of catching a great genius. But the units compared in registration figures are not at all of the same value. We are counting heads without regard to what they contain. A student in the Agricultural School of the University of Minnesota is a very different sort of an individual and is doing a very different kind of work from a graduate student at Johns Hopkins who may have had ten years' more schooling. In fact Johns Hopkins spends on the average five times as much a year on the instruction of a student as Minnesota does.* The expenditure per student for instruction is less in Minnesota than in any other of

the fourteen universities, owing to the fact that the classes are large, the faculty are overworked and underpaid and there is comparatively little graduate work done.

In comparing the number of students of the different universities those in the School (not the College) of Agriculture at Minnesota should properly be excluded, for they are barely of high-school grade. Subtracting the number of students in the School, about 850, the University of Minnesota ranks seventh instead of third in total attendance. The School of Agriculture is under the circumstances a perfectly legitimate branch of the work of the university and one of its most original and interesting features, but in statistical comparisons it is necessary to leave it out. A similar deduction tho a very much smaller one has to be made in the case of Wisconsin.

The University of Minnesota, as we have seen, has become in a remarkably short time one of the greatest universities in the United States, and circumstances seem to favor its continued and increased prosperity. In the first place, its location gives it exceptional opportunities. In considering the relative growth of American universities in recent years it is apparent that a State university has an advantage over an endowed university and a university in a large city an advantage over one in the country. The University of Minnesota as the only State university in a large city, with the possible exception of California, combines these advantages. The cities of Minneapolis and St. Paul with a total population now of about 550,000 will in themselves support a large university. Location at a State capital is also a great advantage to a university. The campus of the university is not quite so neighborly to the State House as is the case at Madison, but it is close enough so the legislators and other officials can become personally acquainted with the work of the institution and may in the future receive the aid of the faculty in administrative affairs as is done in Wisconsin. The university has a clear field inside the State and a good chance outside. It is not, like the State University of Ohio, encompassed by a host of other colleges. It has not as in Michigan been separated from its colleges of agriculture

*The figures are \$324 and \$66 respectively, obtained by dividing the sum of the salaries of the instructional staff by the total number of students. See Bulletin 2, Carnegie Foundation, and THE INDEPENDENT, January 7, 1909.

THE NUMBER OF STUDENTS IN THE UNIVERSITY OF MINNESOTA, 1888-1908.

and mining. To the westward it has no competitors of its size and standing until the Pacific coast is reached. Of course eventually the Missouri valley and the Rocky Mountain States will develop their own universities of similar character, but in the meantime the University of Minnesota could draw largely from the western half of the United States for advanced work. As a mere matter of financial policy it would pay Minnesota to bring its graduate and professional schools quickly into the front rank because students from other States contribute to the revenues of the university as well as add to its reputation. That the university will receive adequate support seems to be assured, for Minnesota will be one of the richest and most populous States and the last two Legislatures have shown a disposition to recognize the growing needs of the institution. Including all its sources of income, State tax and special appropriations, Federal

funds, student fees, endowment, etc., the University of Minnesota will have for spending during the coming biennium about \$3,700,000. The university has been more fortunate than other State universities in retaining a larger portion of its early land grants. These contain extensive iron ore deposits and according to the estimate of the State Auditor they will eventually be worth thirty or forty million dollars.

Times have changed since President Northrop became the head of the university a quarter-century ago. Then the Regents thought themselves fortunate to have a building appropriation of \$30,000 a year for six years, and the President of the Board said that he thought Minnesota would be greatly displeased if the university did not with that sum build all the buildings it would ever need. There were then two buildings, both since destroyed by fire. Now there are twenty-three buildings on the campus, as many more belonging to the agricultural college, and the recent Legislature authorized the erection of ten new buildings. At the first commencement of his administration President Northrop handed out nineteen diplomas; last commencement there were 550. Practically all of the 6,300 living alumni have, therefore, been educated by him. "Educated by him" is here to be understood with some literalness, for President Northrop is known and loved by a large proportion of the students, which is more than can be said of every president of a great university nowadays. In his address at the Yale bicentennial he said: "I would rather have the glory which rests upon the memory of Dr. Arnold, of Rugby, than the halo which encircles the proudest don of Oxford." This glory he has attained, and it may well be considered the equivalent of the glory of making a scientific discovery, of writing a great book, of being the ambassador of the nation or of revolutionizing an educational system. Sometimes one can get a glimpse of a president as seen thru students' eyes from the college publications. I quote one stanza from a poem in the *Gopher* of 1901, which is rather different in tone from what usually appears in class annuals:

“When Prexy prays
Our heads all bow,
A sense of peace
Smooths every brow,
Our hearts deep stirred
No whispers raise,
At chapel time
When Prexy prays.”

Somewhat the same sentiment is expressed in the following lines from the *Alumni Weekly* of this year:

“In Prexy’s face
Are many stories—some of them are glad,
Told in a smile for youthful joy and mirth;
And some of them are tender, having birth
In tears of sympathy when hearts are sad.
Power, strength and comfort, all are there,
And even a dim soft shadow, sorrow’s trace.
With these the hand of Time has set Love’s seal
In Prexy’s face.”

President Eliot retires from office but little in advance of President Northrop, at the same age, seventy-five, and the two universities are not far from the same size, yet the mode and character of the influence exerted by the two men and the way they are regarded by their students and faculty form an interesting contrast. The contrast is, however, scarcely greater than between President Northrop and his own university. It is curious to see how an immense Western State university has grown up under a man of the type of the New England college president. I fancy he must at times have looked upon it as an ugly duckling when it showed a disposition to develop characteristics very different from dear old Yale. But

THE DISTRIBUTION OF STUDENTS IN THE UNIVERSITY OF MINNESOTA, 1908.

while he has stood staunchly for his own ideals of education and culture, he has retained a remarkable degree of open-mindedness, and met new conditions and demands with a certain good-humored tolerance that has gone far to keep the institution free from the growing pains incident to such rapid development. His attitude toward innovations is best expressed in his own words by a quotation from his last annual report, where, in speaking of the addition of accounting and insurance to the curriculum, he says:

"This is only one of the many subjects that are continually appealing for special recognition either by the establishment of new chairs or the introduction of new specialists to deal with new courses. Practically there is no end to the possible demands of this kind. But there is a limit to the University's ability to establish and maintain new chairs—and it is not wise to search very much for opportunities to expand. It is wise for all departments to do the best work they can and in the most thoro way with the forces at their command. Such new subjects as may present themselves as desirable additions to the curriculum the Regents will entertain as hospitably always as the funds of the University will permit."

The president is no doubt wise in resisting the easily besetting sin of Western universities, the disposition to multiply courses, departments and schools, regardless of needs and means, the tendency to expand like a bubble, merely superficially. But this attitude of waiting for something to turn up and force itself in is very different from that of rival institutions, like Wisconsin and Illinois, which are hustling to find new ways of making themselves useful, like an office boy who has just got a job.

Like a manufacturer who has built up a big business by his own exertions, President Northrop does his office work in his head. He has a distaste for red tape of all kinds, especially the elaborate circulatory system of reports, memoranda and acknowledgments which is the pride of the modern expert in administration. The burning questions of vertical versus horizontal filing, of wet copying versus dry copying, and the claims of rival card indexes, do not interest him, for he has no use for any of them. A little interest in a leisurely typewriter suffices for his formal correspondence, and he much prefers a face to face and heart to heart talk with a

professor or student to using a telephone or any other kind of intermediary mechanism. There are no halberdiers or grooms of the antechamber to protect his dignity or time. It is not necessary to negotiate an interview in advance; you cannot even send in your card, because there is nobody to take it. You turn to the right after you pass thru the Doric porch of the library building, the office door is open and he will be glad to see you. But you cannot stay after 10:30 a. m., for he has an imperative engagement at that hour. Then he locks his office door and goes down the corridor to the little side entrance to the platform of the chapel, where a dozen of the faculty and one or two hundred students are assembled. This is, I believe, the only one of the larger State universities where daily chapel exercises are held. The attendance is voluntary, and that it keeps up as well as it does is due chiefly to President Northrop's practical, earnest and humorous talk on life in the university—and out of it. For it must not be inferred from what I have said that the president does not know what is going on in his big, complicated institution, and have a hand in it all. What puzzles me is how he runs things without any of the usual administrative machinery. His successor will not be able to. This year marks the end of the patriarchal *régime* in the university. The new president will be of necessity more of a constitutional sovereign and bureaucrat.

The reason why the State universities seem so alike is because undergraduate instruction is much the same everywhere, and the Western States were alike at first in population, conditions and educational needs. But as the universities add higher departments of research and technology and come into closer touch with the life of their people, they will differentiate as the States are differentiating. In pioneer days every town believed itself destined to become "the railroad center of the West," and did not hesitate to say so, and every county claimed to raise everything from sugar cane to winter wheat. But the days when aspiration radiated equally in all directions have passed. If a county can boast of a soil which has a national

reputation for some one crop, say muskmelons or sugar beets, and can besides raise enough garden truck to supply the local needs, it is tolerably well satisfied with itself nowadays. We may hope for a similar specialization and limitation of ambitions in Western institutions of higher education, State and independent. Colleges used to be employed like railroads and court houses to boom towns. I can remember when a town was regarded as having made a promising and creditable showing if at the end

to his presbytery, conference or association, the name may be varied at pleasure, that the year had been a prosperous one for his department. "We have established three universities and have the logs ready for a fourth." That would have been all right if a Mark Hopkins and a student could have been found for every log, but the supply of both was too limited to permit the survival of all the colleges so optimistically started. Still we have no reason to regret the educational lavishness of our forefathers.

FOLWELL HALL.

The main collegiate building of the university.

of its fifteenth year it could boast of 25,000 inhabitants, two daily papers, three universities, four banks and thirteen churches. The tourist of today will sometimes see from his car window a pretentious looking building standing by itself on the prairie miles away from town or city, and if he inquires of a local passenger he may be told that it was the Continental University, established to raise the price of lots in Snooks's Addition. There is a story told—but this was before my day—of a Chairman of the Committee on Education, who reported

Many seeds have to be sown to get a single stalk, and there is only one way to tell the stony from the fertile ground. The chief harm was the temporary degradation of the word "university," but this was soon rehabilitated, and Eastern colleges, which used to disdain the name, were glad to adopt it. The struggle for existence has been severe and full of hardship for individuals, but beneficial to the community, for the strife for students has brought into the college circle a larger proportion of the population than used to be thought pos-

sible. Some of these hastily planted institutions have become State universities; some rival the State universities in size and standing; others are finding their places as colleges or academies. The weeding-out process is just now very active under the influence of the General Education Board, which, having at its command about \$53,000,000 to give away, is able to enforce its judgment as to which colleges are fittest to survive. It is popularly believed that the secretary of the board sets his compasses by the hundred mile mark on the map of a State and then covers it with tangential circles, and the college that is nearest the center of a circle gets the money. This has a beneficial effect in two ways: it insures a more even covering of the territory and it causes the colleges to decide upon their proper function and to seek out their true sphere of influence. Their relation to the large universities is also rapidly being defined.

The differentiation of the State universities will not be forced by such outside influences, nor by competition with one another, for this practically affects only the higher departments. But the newer States begin to show peculiar characteristics as the population and industries become more settled, and these characteristics will appear in their universities. If there is anything at all in either of the once dominant theories, that the history of a people is determined by its climate or by its race, the State universities will bring forth different kinds of scientists, authors and artists. For example, the University of Minnesota is as strongly Scandinavian as the University of Wisconsin is German. A stranger could tell which campus he was on by the easy and pleasant method of sitting on the fence at the noon hour and watching the girls go by. In Minneapolis he would see many who could play the role of the Viking's daughter without any making up. In Madison he would be struck by the number of Germans, not the dumpy rosy kind, but the tall, long-faced brunette type. For lack of an adequate anthropological vocabulary I fear I do not make myself clear on this point, but I suspect some of the enterprising young sociologists in these universities take the question as a thesis

subject. In the foreign-born population of Wisconsin the Germans outnumber the Scandinavians two to one; in Minnesota this ratio is exactly reversed.

Scandinavians claim to have produced more great men in proportion to the population than any other race except the Greeks. Their percentage of illiteracy is the lowest of any in Europe. In the Western schools in general the Scandinavian students, like the Jews in the East, have the enviable reputation for getting to the top of the class and carrying off any medals, prizes and scholarships that may be available. We have, therefore, a right to expect that the University of Minnesota, which has now almost as many students of Scandinavian descent as the University of Upsala, will contribute more than its quota of names to future American biographical dictionaries.

The larger State universities have reached a point where they should consciously decide in what lines they will specialize, and in coming to such a decision they should take into consideration their racial constituency as well as their situation. The University of Wisconsin or of Illinois should become the center of Germanic culture in the United States and the University of Minnesota of Scandinavian.

The universities seem hardly awake to the importance of utilizing their natural advantages in this respect, altho some slight tendency toward such specialization can already be detected. The University of Minnesota has two professors of Scandinavian literature offering twelve courses, and there is cataloged a course in Swedish philosophy, but these are not very popular, and some of those who elect them are led more by the love of ease than love of culture. The same advantage is taken of modern languages everywhere, for a student can get credit on the books of the high school or college for the mastery of a language which he knew in advance better than his classmates of American parentage can ever know it. But the proportion of "snap hunters" is not large in Minnesota, and most of those who can read Ibsen in the original prefer to stumble thru Molière. It somehow seems to them more American to study French or

Latin literature than Norwegian or Swedish.

The desire of our immigrants for quick Americanization is, of course, commendable, and it would be unfortunate for the country if it were otherwise, but they should not in their haste cut themselves loose so completely from the mother country. German philosophy, German science and German literature have in the last half century profoundly influenced American thought, but the influence has not come to any great extent thru the German immigrants. They have sworn off allegiance to the Kaiser and Kant together. Some of them, it is true, had never heard of Kant, but they had been under his sway quite as much as under the Kaiser's. The reason why the United States is not being enriched by a transfusion of European culture at the same time that it is being enriched by a transfusion of European blood is not so much because the immigrants are from the uncultured classes as because they shut off the channel of communication with the higher life of the countries they have left. The children disown their mother's tongue. They sacrifice their bilingual birthright in order to adopt the American insularity of their schoolmates. They are sometimes even ashamed of their European heritage. If you call a Minnesota youth a Swede he is apt to resent it as an insult, particularly if he happens to be a Norwegian. The universities should do something to cultivate a proper race pride which would not in the least interfere with a true Americanism. The members of the Huguenot Society, of the Holland Society and of the Society of Mayflower Descendants may be undemocratic, but they are not unpatriotic. And steerage on the "Mauritania" is preferable to first class on the "Mayflower."

In the University of Wisconsin there are some evidences of Teutonic influence, altho the most conspicuous is the abundance of beer. At the University of Minnesota there is a Scandinavian Society, and this spring a Norwegian play — Holberg's "Den Stundesløse" — was presented by the students. Why should not Minnesota follow Columbia in establishing an exchange of profes-

sors with Scandinavian universities? If I may be permitted a suggestion I would advise the Minnesota Regents to send to Stockholm for Svante Arrhenius, give him any salary he demands, and make him Professor of Cosmogony. This would be a good investment, for it would in itself be sufficient to place the institution among the great universities of the world, and I do not know of any cheaper or quicker way of doing it. The university would naturally prefer to grow its own great men, but this will take time. I saw on the campus more than one stocky, yellow-haired and big-headed young fellow looking as much like Arrhenius as his younger brother, but they are not likely to go in for cosmical physics.

The University of Minnesota needs "head liners." I have no reason to think that its instructional staff as a whole is inferior to those of other universities, but it has few men of great prominence. I think it is safe to say that the average well-informed person would be able to give the names of more professors of any other of the fourteen universities than of Minnesota. Its faculty does not become conspicuous thru making sensational discoveries or bad breaks. Consequently the university does not get advertised and is, in fact, less known to the public than many smaller, poorer and less important institutions. President Northrop is opposed to university advertising, both the kind that is paid for and the kind that is otherwise obtained. He holds that true scholarship is modest and avoids publicity. This is a commendable ideal.

It is unusual to find statuary on the campus of a State university. In fact, I can recall none elsewhere except the football player which stands at the entrance of the University of California. But the University of Minnesota is exceptional in possessing two bronze statues of heroic size and artistic merit. One of the "student-soldier," by Theo. Alice Ruggles-Kitson, commemorates the 218 university men who served their country in the war with Spain. The other is a statue by Daniel C. French of Governor J. S. Pillsbury. His name is a household word the country over in connection with "Pillsbury's Best," but

on the campus he is known as "the Father of the University." Never was title more deserved. He was a regent from 1863 to the day of his death in 1901, part of that time *ex officio* as Governor, and the rest of the time by appointment. He was President Northrop's chief adviser and supporter in the development of the university, and more than once saved it from disaster. In 1864, when it was supposed to be bankrupt, he took charge of its affairs and cleared it of debt, and yet saved a large

shadowing of the university. On the contrary, it is, as I have implied, one of its most vigorous and progressive departments, and has set the pace to other State agricultural colleges in methods of research and of education. Here was begun early the breeding of seed for greater yields, and it is estimated that Minnesota gains \$2,000,000 a year thru the use of the pedigreed varieties of corn, wheat, oats, barley and flax developed in this experiment station. The Colonial Dames are not half so firm in

THE SCHOOL OF AGRICULTURE

part of its lands, now proving to be of immense value. In 1887, when the Legislature was determined to take away the agricultural college, he put a stop to the movement by offering to give a science hall costing \$130,000 if the institution was kept intact.

By this timely action Minnesota was saved from the dividing of educational forces and duplication of work, which has been so unfortunate in the case of Michigan, Kansas, Colorado, Oklahoma and other States. Nor has the agricultural college been stunted by the over-

the faith that "blood will tell" as are the young men whom you find sorting the seed at the agricultural college. Pick out a kernel of wheat from one of the thousands of envelopes here shelved, and they will refer to the herd book, or whatever they call it, and give you its ancestry for ten generations back, telling you how many kernels each stalk produced each year and their weight.

But to double the yield on the farms of the State, as the college is hoping to do, the intelligence of the average farmer must be quadrupled; accordingly, the

Minnesota authorities are working out a system of industrial education for the whole State on an unprecedented scale. The aim is to have a well equipped agricultural high school within reach of every farmer boy and girl in Minnesota, either by establishing independent schools or subsidizing the existing high schools which add the necessary branches. The latter is certainly preferable, for it is as bad policy to divide the high schools on class lines as to divide the university. Two model agricultural high schools, under the control of the university, have been established at St. Anthony Park and at Crookston. These schools educate for the farm, not away from it. They are completely coeducational except for occupational segregation, the boys taking carpentry, blacksmithing, stock judging and military drill, while the girls are taking cooking, dressmaking, home management and etiquette. It is interesting to see how much more attention is paid to the esthetic side of life in the industrial schools here and elsewhere than in the department which monopolizes the name of "College of Arts." Music, literary society work, nature study and art in various forms of handicraft, are required of all. On the other hand, a man could get a "liberal college education" without having ever attempted to sing a song, make a speech or draw a design. The agricultural school is the only part of the university having dormitories. The total expenses of a student in the school are officially estimated at less than \$85 a year, not counting the cadet uniform. The agricultural school and college occupy an extensive and ultimately an extremely valuable piece of land midway between the Twin Cities at St. Anthony Park. It is two miles away from the main campus and is practically an independent institution, being under a stricter *régime* and having a social life of its own.

The main part of the university is located on a high bluff around which winds the Mississippi. Looking across the Mississippi we see the skyscrapers of the business center of Minneapolis, and in the river at our feet the Falls of St. Anthony, to which the city owes its prosperity. These falls abandoned all pre-

tensions to beauty long ago when they went into the mill business, but four miles down the river the Minnehaha Falls are protected by a surrounding park and so retain their pristine charm. They are at least as near to nature as Longfellow's Indians. Minnehaha being one of the few spots in America about which legend and poetry have grown and having but little water in it anyway, is not likely to be interfered with by the demands of manufacture, but the fall in the Mississippi is another matter. Father Hennepin's discovery of 1680 has proved more valuable than a gold mine, and in the rapidly approaching future, when our industries will be dependent on liquid coal, it will be a still greater source of wealth. If the plans now being made for its more complete utilization are carried thru, the shops of the university and the factories of the Twin Cities will receive cheap and abundant power from the Mississippi.

The university has so far not realized the scenic possibilities of its site. The buildings turn their backs on the river, whereas if they were properly grouped they could produce an effect like the new buildings of the College of the City of New York, as seen from St. Nicholas Park. The campus is smoked by two railroads that cross it and threatened by the stench of a packing-house established nearby. The extension of the campus, for which the last Legislature appropriated \$350,000, will give the university still more river frontage, but the new plans for the architectural development of the university, as published in the *Alumni Weekly*, make no better use of the natural advantages of the location than is done on the old campus. The new buildings do not conform to the curve of the bluff and river, but to the railroad track, which, it is hoped, may be removed. They are to be stiffly set in squares, like city blocks, altho such an arrangement in this case is neither necessary, convenient nor pleasing. It is to be hoped that these plans will be reconsidered before the university is committed to the investment of a million dollars in buildings. Unless it is, the new campus will be inferior to the old, which presents quite an attractive appearance in spite of or because of the fact that it

PLOWING CONTEST.
School of Agriculture.

was not planned at all, but grew up at haphazard. In architectural style the buildings range from Phidias to Richardson. None of them, as I have said, is over twenty-five years old. This is due to the custom of burning down a building whenever the president goes away, at least I was so informed when I inquired about the traditions of the university. If that is the case I suggest that the president be not allowed to leave the city, for if he does the chemical laboratory is likely to go, as this building is wooden, altho it has a heavy stone exterior, so heavy, in fact, that the keystones in the window arches have to be propped in place. The newest building, Folwell Hall, so named after the first president, is of much more substantial construction, and indeed is one of the most convenient and handsomely finished recitation halls I have ever been in. The library building, on the other hand, is very awkwardly planned.

The prettiest building on the campus is naturally the woman's building, Alice Shevlin Hall, of red brick trimmed with terra-cotta. It was put up by a gift of \$60,000 from Thomas Shevlin, and it has been furnished thru the efforts of the Y. W. C. A. and the Woman's League in excellent taste, so as to give the impression of both comfort and freedom, while avoiding altogether the institu-

tional air. The big living room, two stories high, with a fireplace at one end, is very attractive, perhaps because one of the rules adopted by the Self-Government Association prohibits all studying in it. There is a cafeteria which furnishes lunches at ten or fifteen cents and turns in a surplus to the hall at that. Universities running their dining halls at a loss of several thousand dollars a year please take notice. But the most useful feature of the building is a large bare, quiet, darkened room with no books, no pictures and no furniture except fifteen couches, whereon the young women may relax *à la Delsarte* in a vacant hour. I imagine that this will prevent a good many failures in school work and a good many failures in home work afterward.

All the four State universities of this group, Michigan, Wisconsin, Illinois and Minnesota, have now provided clubhouses of this kind for the women students, and the men in these universities are earnestly striving to follow suit. Plans for the Minnesota Union have already reached the blue-print stage and are likely in a few years to get into brick and stone. A dormitory for the women was authorized by the last Legislature. No such accommodation seems to be in prospect for the men. Except for those who gain admittance into fraternities the

STUDENTS IN THE DAIRY SCHOOL GETTING CULTURES.

students live at home or board around town. About 39 per cent. of the students come from the Twin Cities, and they disperse over an area of ten miles' radius when their classes are over, leaving the campus in the evenings deserted as a business district on Sunday. They retain their own family, church and social affiliations and look upon the university as merely a continuation of the high school. I am not sure that this is a bad thing for them. Our universities have not been so successful in handling young people in bulk that they can claim any decided superiority over the home. But it interferes, of course, with the development of a sentiment of solidarity, and it throws the burden of campus life and activities largely upon the country students who room in the immediate vicinity. Here as elsewhere the fraternity men, altho above the average in talents, training and means, fall below the average in scholarship and take little part in voluntary literary work. In the last twelve years but one fraternity man has represented the University of Minnesota in an intercollegiate oratorical contest and but five in intercollegiate debate, altho twenty-one such honors have been awarded in the former and eighty-one in the latter. There are forty-six fraternities and sororities in the university and all the other organizations of every kind number only forty-nine.

Altho it is to be classed as a city university, the standard of expenditure is very low compared with Eastern institutions. According to an investigation made by a senior in economics last year, the average amount of money spent by the students from out of town is \$427.45. The city students spent on the average \$327.37. The most extravagant fellow in the university was a senior who spent \$884.50 in one year. The item of clothing ranges from \$57.30 a year for out of town students who earn their own living to \$133.49 for the city student who does not support himself. Over 64 per cent. of the students earn something toward their support during the summer months, earning on the average \$116.31.

Probably no other great university could show so large a proportion of self-supporting students, and Minnesota will not be able to keep it up very long. It is becoming more difficult everywhere for a young man to put himself thru school, because the cost of living and education is rising and the opportunities for employment are being naturally and artificially curtailed. Already in Minnesota the labor papers are attacking the university because the students work their way, even tho they confine themselves to the unorganized occupations and such humble employment as waiting on table and tending furnace. If they succeed, as they probably will, in their

effort to cut off students from all kinds of temporary and incidental employment, then it will be in vain that the State provides higher education free, for it will only be available to the well-to-do classes. Formerly a student who worked his way thru college anywhere was regarded with approval, even heroized. Now he meets with condemnation on both sides; from his associates in his work because he is willing to do anything and do it cheap, and from his associates in his study because he lowers the tone of the college and does not contribute to its athletics and social display. "A man who waits on a table cannot make our fraternity" is heard in more than one university. Neither can he make a union, because he is primarily a student, so he gets shut out on both sides. I have known several poor boys who started out to earn their own way thru college, believing it to be the most honest way, but who gave it up and borrowed money because of the double burden of disapproval. They told me, and they ought to know, that a man who spends freely and runs in debt is regarded more favorably and gets along better than one who works and economizes. Legislation is reinforcing public opinion in this matter. A Chinese boy who tries to help himself by waiting on table gets deported for his crime. We will admit a Chinese student to this country if he is independently rich, but not if he is independently poor. The chief refuge of the college student in the old days used to be teaching summer school, but the profession of teaching in all branches is becoming so hedged about with restrictions as to be unavailable. A student is not even allowed to utilize the art in which the modern college trains most efficiently, athletics. If he plays baseball during the summer for money he is disgraced. Many of our colleges were started with the idea, which appears feasible from an *a priori* standpoint, that students should support themselves, at least in part, by labor for the college, such as putting up the buildings, working on a farm, etc., but as these institutions have grown in numbers and wealth this plan has been abandoned, in most cases completely, and today we are further from it than ever and heading in

the opposite direction. If a student builds a brick wall nowadays to learn how, he is made to tear it down again. That is, even in so-called industrial schools he is not allowed to work, but compelled to play at working. It is no wonder that some of our most clear-sighted and self-respecting young men desert our colleges every year thru sheer disgust. The artificiality of it makes them tired. It is idle to deplore the increasing predominance of the leisure class in our colleges when we are by force of law and public opinion compelling college students, as we have convicts, to become a leisure class. I see only two movements which might counteract the prevailing tendency to make higher education increasingly expensive and parasitic. One is the plan of the University of Cincinnati, by which engineering students work alternately two weeks in the classroom and two weeks in the shops. The other way is to bring higher education to the people who are at work by some form of university extension.

The University of Minnesota has as yet done little for the vocational and cultural training of the people of the State at large, except as before noted in agriculture, but this year two other departments—those of economics and education—have also received special appropriations for extension work and are prepared for an energetic campaign of popular education. The department of economics has recently shown itself very much alive by its rapid proliferation of new courses and has already manifested a tendency to sprout in the direction of commercial training. Being in a city and near the capital, there is a good opportunity for the development of night schools, as in the University of Pennsylvania, and for co-operation in the State administration, as in the University of Wisconsin. The College of Law has led the way by its four-year evening course, corresponding to the three-year day course, and about one-third of the law students are taking advantage of this opportunity. The late Legislature unfortunately did not see fit to establish a legislative reference library on the Wisconsin model, but this will come in time and gradually. It must be remembered

that the legislators of Wisconsin did not establish anything of the kind either. They merely hired a man named McCarthy, at a low salary, to keep their catalog in order, and if he chose to create a new and much needed department of administration instead of spending his life arranging cards according to the Dewey numbers in the upper left corner, why, that was none of their business. The Government of Minnesota does not need more books particularly; it needs a McCarthy.

The work in education was started in

versity credit is given. It is now chiefly a teachers' training school, but its scope should be extended to include other professions.

For example, physicians would find it advantageous to come to the university every few years to learn new methods or to carry on researches of their own. The College of Medicine and Surgery of Minnesota stands higher, I believe, in comparison with other schools of its kind in the United States, than does the College of Law. It is favored by its situation. The universities of Illinois

The Woman's Building.

1885 by Prof. Harry P. Judson, now president of the University of Chicago, and has become a full-fledged college, ambitious to have a building and a model school of its own. The admirable public school system of Minnesota has developed from the first in close touch with the State university. The relationship is indicated by the fact that the summer session is managed by the State Superintendent of Public Instruction, and is not, strictly speaking, a part of the university, altho it makes use of the buildings and instructional staff of the university, and for some of its courses uni-

versity credit is given. It is now chiefly a teachers' training school, but its scope should be extended to include other professions. The University of Minnesota has access to eleven hospitals, with a total of 1,620 beds. The State Board of Health has a new and admirably constructed building on the campus, in which bacteriological, chemical and pathological examinations are made on material sent in from all parts of the State. The Regents had the courage and good sense to attempt to put an end to the system of maintaining two distinct medical schools by providing two chairs of homeopathy in the regular College of Medicine and Sur-

gery, covering the subjects of therapeutics and materia medica, and students taking these courses in preference to those of the rival school would receive the homeopathic degree. The homeopaths of the State appealed to the Legislature and obtained an appropriation of \$50,000 for a new and independent building, altho the College of Homeopathic Medicine and Surgery had nearly worked itself out; last fall it was reduced to two seniors and one junior, yet it occupied its fifty pages in the university catalog and listed a faculty of thirty-five. The action of the Legislature in virtually reversing a decision of the Regents creates a situation like that which at one time nearly ruined the University of Michigan on the same question. It is to be hoped that some arrangement can be made by which all the medical work can be kept together, in order to avoid such duplication of instruction and dividing of interests as now results from the agricultural college being so far away from the rest of the university.

Now that all physicians are less dogmatic and more eclectic, there is no sufficient reason for perpetuating the old feud. The science has fortunately made such advances that we can now look down on the battleground and calmly note its positions without quarreling over which was right, or, rather, which was least wrong. The important thing is the lesson that the formation of medical sects can be avoided in the future only by a disposition on the part of the established schools promptly to recognize and receive any new movement which arises outside the circle of orthodoxy and seems to have any good at all in it. For example, psychotherapy might be considered such a movement at the present time. Loaded down as it is now with charlatanism in practice and absurdity in its theory, yet it appears to have a certain vitality, that is to say, validity. But assuming that it turns out to be altogether chimerical, a Chair of Psychotherapy in a university is less dangerous to humanity than a College of Mental Magic somewhere outside. Merely as a prophylactic measure it might be well if our universities were inoculated with mild doses of every heresy that turns up—scientific, philosophical or sociological. Then our

graduates would be to some extent immunized and not so apt to fall victims to any craziness of the crowd* that happened to be epidemic in the outer world.

I have referred to some of the ways in which the University of Minnesota is adapting itself to the peculiar needs of the State, but I must mention two more: One the School of Chemistry, created by the energy and initiative of Professor Frankforter, and especially devoted to the applications of the science to Minnesota industries. The other is the School of Forestry, which has for its summer laboratory the Itasca State Park of 22,000 acres at the headwaters of the Mississippi.

The new buildings for the schools of applied science, such as chemistry, engineering and medicine, are to be placed upon the recently acquired addition to the campus. This means that the new campus will be virtually a masculine domain, while the old campus, which means the old college, will be predominantly feminine. This, however, will be merely a geographical expression of the present condition, which results naturally from the freedom of election. An example of this differentiation of the sexes is the membership in the two honorary societies. In the University of Minnesota this year the Phi Beta Kappa, choosing students from the senior class for their literary proficiency, elected thirteen women and four men. The Sigma Xi, basing its selection on the ability to carry on scientific research, elected thirty-one men and four women. In the College of Science, Literature and the Arts, the college proper according to the old idea, the women outnumber the men two to one. In the higher classes and in the purely literary courses, the proportion of women is still greater and tends to increase.

There are now over 1,400 women in the University of Minnesota, a larger number than in any woman's college in the United States.

The tendency of the women to congregate in the college of arts has been interpreted by some as indicating the superior taste and higher ideals of the sex. Personally I should question this, for, in spite of appearances, I doubt

*If you go to the great convention of *Les Femmes*

whether women as a rule have any more fondness for "pure culture" than men have. It must be remembered, first, that the literary studies are vocational for women, as leading to the profession in which they are most welcomed, that is, teaching; and second, that very little has been done in the universities as yet to provide other forms of vocational training for them.

But the women, in spite of their disposition to swamp certain courses, are welcomed and well treated in the University of Minnesota. The spirit of equality is dominant thruout the institution. There are sixteen women on the instructional staff. Most of them fill minor positions, but one, Miss Maria L. Sanford, has been professor of rhetoric and elocution for twenty-nine years. She retires on a Carnegie pension this spring, at the age of seventy-three, highly esteemed and beloved for her services to the State at large, as well as for her work in the university.

If any attempt were made at discrimination against the women, the men of the university would promptly come to their defense. An instance of their gallantry occurred while I was in Minneapolis. The president announced in

chapel that the young women should not go with the young men on the special train to Chicago for the football game. The rule was obviously sensible, because it could not be expected that a thousand students, whether victorious or defeated, would maintain perfect decorum on the return trip, but it was resented, as every new restriction is in the West. The interesting point is that the boys were as indignant about it as the girls, and the student daily published protesting editorials. They were determined that the rooting should not lack its treble clef. But imagine the Harvard students going on a strike because President Eliot would not allow the Radcliffe girls to go with them when they went to New Haven to be beaten at football, or the Columbia boys insisting on taking Barnard in a body to Ithaca for an intercollegiate debate. The president calmed the incipient rebellion by his personal influence and a little diplomacy. But however misdirected, it was an interesting example of Western chivalry, of the real chivalry which demands equal privileges for the weaker sex instead of trying to shut them out or crush them out of every possible opportunity in work or play.

The Wayfarer

BY AUGUSTUS WIGHT BOMBERGER

As I pondered whose knock it might be,
Or stranger, or comrade, or kin,
One stood there I trembled to see,
And begged me to let him come in.

His garments, 'twas easy to trace,
Were sackcloth and drenched with the night;
But I caught a high look in his face
Protesting his heavenly right.

So I yielded. And, bearing his woe,
He darkened my dwelling with tears;
And remaineth: Nor ever shall go!—
Unfaltering friend of the years.

NORRISTOWN, PA.

kind and another, and succeeds in putting the essentials of the matter in an unembarrassed and intelligible shape.

Similarly, if the object of English composition is to set pupils to writing out of their own heads—as many nowadays think it to be—then Mr. Hitchcock's *Practice-Book* deserves little except commendation. It contains the minimum of precept and direction, but is arranged as a series of graded exercises in expression, presumably for early high school use. The first part is concerned with what used to be called "invention," and contains chapters on the several "forms of discourse," including the letter and the short story. The second part is devoted to words and sentences, providing practice in spelling, grammar and the use of the dictionary. The third part is properly rhetorical in the narrower sense and deals with the composition of sentence and paragraph, and the fourth takes up, perhaps not so practically, the subject of versification.

Dr. McMurry's *Special Method in Reading* is not only an elaborate discussion of the function of story telling and general reading in education; it is a handbook of procedure as well. Dr. McMurry has worked out the whole matter of story telling so thoroly in its relation to teacher and pupils, he has systematized it so carefully and satisfactorily, that it seems almost ungrateful to suggest there may be a certain amount of virtue in work as work quite divorced from the entertainment with which, following the present fashion, the writer appears anxious to invest his instruction. At the same time, even if he has been a little inclined to draw the subject toward himself, his book contains a good many useful hints and observations, particularly so with reference to the primary teaching of reading—to say nothing of the advantage of having the entire matter once worked out and exhibited. Some of this same ground is covered also by Professor Cox's *Literature in the Common Schools*. While both books are intended for teachers and admirable for their enthusiastic advocacy of reading, each has its own point of view and approaches the subject in its own way. The latter, if anything, lays the heavier stress on meaning and expression. Both

are equally commendable for their bibliographical equipment. Intended for the same audience, too, and overlapping the same subject is still a third volume, *Teaching to Read*, by the inspector of the Toronto schools. Mr. Hughes's attitude is in some respects quite different from the others'; he has a thesis to maintain. He believes that reading consists essentially in acquiring thought thru visible words, not in learning to repeat those words aloud, and that one of the most important *desiderata* of reading is speed. Accordingly he contends that merely learning to read aloud is not learning to read at all. While he further maintains that learning to speak and to read a language are two very different matters and should not be confounded. In teaching children to read properly, as he understands it, he advocates the phonic method. On these and other topics his little book deserves consideration.

Dr. Esenwein's *Writing the Short Story* continues in a manner the general subject of the story for elder students, tho with a difference. Dr. Esenwein is editor of *Lippincott's*, and his book is in some respects an odd mixture of literature, journalism and commercialism. At the same time it is as intensely practical, or, rather, professional, as Dr. McMurry's *Special Method* is pedagogical. Its constant preoccupation is availability, not the least important chapter having to do with the marketing of the writer's wares. To be sure, this is a point of view like another, and more stimulating than many; to get composition put upon the same bottom as civil and electrical engineering is something, after all. And while the author does not add much to the criticism of the subject, he does succeed in collecting a good deal of information for the practitioner.

In this same line of special composition may be mentioned Professor Shorter's *Rhetoric of Oratory*. The book is much more academic than Dr. Esenwein's, it must be confessed, and something of the indefiniteness natural to the subject attaches to the writer's treatment. Still, he discusses most topics connected with his theme, such as the divisions of the oration, oratorical style, the making of an orator, and the like. The feature of the volume, however, is

an appendix containing a collection of prize orations by college speakers.

A volume of *Specimens of Exposition and Argument* illustrates the present disposition to substitute current and familiar models of writing for the older classic paradigms, and to reduce the "literary," while increasing the practical element in English instruction—the disposition, in short, to consider composition a kind of trade.

It is of good augury to see so many aids as are now preparing for extensive reading among students of all grades. One of the chief hindrances in the way of literary study has lain in the generally desultory, as well as in the over-intensive, character of the work. That wide and related reading is essential to the understanding and appreciation of literature is a truth which seems to be gaining recognition at last. This year, for example, there are not only the usual good editions of single texts, like *Franklin's Autobiography*, the *Essays of Elia*, a selection of Old Testament stories, and several volumes of the new *Hudson Shakespeare*, with a new and more conservative text, but with the general plan of the work unaltered. And, by the way, while the page of this edition is rather small, its arrangement is admirable for reading, with the text at the top, the notes at the bottom, and the variant readings between. Not only are there these individual volumes and others of the sort, but there are also several comprehensive anthologies, or, rather, collections, which look to a much wider range of study and comparison. Professor Manly has made a garnering of *English Prose* from 1137 to 1890, as a companion to his recent *English Poetry*. The pieces are given mostly *in extenso*; at all events they are substantive, so that the volume affords a pretty thoro survey of English authorship, which may be studied as a whole or in detail. In the absence of cheap and reliable single texts, such books make a valuable acquisition for student or even general reader. Professor Cairns, too, in his *Selections from Early American Writers*, from 1607 to 1890, has conferred the same kind of benefit upon the public. In this case texts for the period are even rarer and harder to come at except in large

libraries. At the same time a collection of ten critical essays, under the title *Nineteenth Century English Prose*, is of value, too, as directing attention away from certain literary forms, like the short story, upon which it has been rather too exclusively fastened of late. The range of selection in this instance extends from Hazlitt to Matthew Arnold.

German and French

- Arnold's Wilhelm*. Edited by Charles Langens. Holt. 40 cents.
Moser's Der Bibliothekar. Edited by Hollon A. Farr. Holt. 40 cents.
Die Hainburg. By Friedrich Ditt. Holt. 30 cents.
Arnold's Fritz auf Fierien. Edited by May Thomas. American Book Co. 30 cents.
Heyse's Er Soll Dein Herr Sein. Edited by Martin H. Haertel. American Book Co. 30 cents.
Baumach's Das Habichtsfräulein. Edited by Morton C. Stewart. Holt. 40 cents.
Ebner-Eschenbach's Lotti, Die Uhrmacherin. Edited by George Henry Needler. Holt. 40 cents.
Goethe's Iphigenie. Edited by A. B. N. Holt. 40 cents.
Goethe's Iphigenie. Edited by Parke R. Holt. American Book Co. 50 cents.
Goethe's Iphigenie. By Mathilde R. Holt. Crowell. 25 cents.
Goethe's Iphigenie. Edited by Parke R. Holt. American Book Co. 40 cents.
Goethe's Hermann und Dorothea. Edited by Waterman T. Hewett. American Book Co. 60 cents.
Goethe's Iphigenie. Edited by W. F. Chalmers. Crowell. 40 cents.
German Prose Composition. By Carl W. F. Osthaus. American Book Co. 65 cents.
German Prose Composition. Edited by Warren Washburn Florer. American Book Co. 70 cents.
German Prose Composition. By H. C. B. Holt. Holt. 40 cents.
Beginning German. A Series of Lessons with an Alphabet of Grammar. By H. C. B. Holt. Second edition. Holt. 60 cents.
German Prose Composition. Edited by O. B. Sage. Holt. 35 cents.
Hugo's Les Misérables. By Douglas Labarre Buffum. Holt. \$1.25.
Hugo's Poemes Choisis. Edited by L. Aguetant. Holt. \$1.
German Prose Composition. Edited by James D. Holt. American Book Co. 45 cents.
German Prose Composition. Edited by Grace Sandwich. Crowell. 50 cents.
German Prose Composition. By L. C. Armstrong. Holt. 90 cents.
Easy French Prose Composition. By H. A. Guerber. American Book Co. 25 cents.

This year's crop of German and French texts seems to indicate that the best of the literary material available for school study and reading has already been utilized. The field of standard classics, of the many skilfully wrought *Novellen*, comedies, *Jugendstücke*, has been thoroly garnered. The fact is that some of the new books will be hard put to it to justify their existence, when there are so many of the same grade serving the purpose far better.

This challenge of *raison d'être* might

be put to Moser's two comedies, *Till Eulenspiegel*, and even Arnold's *Fritz auf Ferien*. Moser's comedies contain some humor, but are of questionable literary value. The others are not the best examples of that splendid *Jugendliteratur* which has been created in recent years and has made so strong an appeal to the youthful imagination that all of a teacher's self-control is needed not to force the reading of five when there is time only for one. For second or third year students—so much depends upon the character of the class that it is hard to fix upon a definite period—Heyse's *Er Soll Dein Herr Sein*, an excellent

reise of Heine have been put into textbook form. The contrast is interesting: Goethe dignified, almost cold, but abstract and subtle; Heine lighter, more emotional, with a rhythmic and free-flowing description that is fascinating. *Das Rothkäppchen* and *Easy German Stories* are for children beginning the study of German. Hewett's edition of Goethe's idyl is excellent enough to rank as a model for its kind. The book of German poems includes many of the poems known and loved by every German; to know these by heart is to possess the key to German character and ideals. At the same time it is one

of the best methods of acquiring the *Sprache-Gefühl* without which all language study is worthless. *German Prose Composition* contains graded selections, English and German, for elementary and advanced translation. *German Inflections* may be of use to a college class as a digest of the principal forms and paradigms of the language. The new edition of Bierwirth's well-constructed and convenient beginner's book is enlarged by optional exercises.

BULL SEAL AND FAMILY.
From Carpenter's "How the World is Clothed"

specimen of the art of the prince of German short-story writers, who, perhaps more than any one else in Germany today, has held high the banner of modern romanticism. The subject, the love-trials of a young widow of a German soldier, living in a garrison town near München, will require for ready appreciation a more mature class of students. *Lotti*, a *Novelle*, describing a very different kind of life—that of the skilled artisan and *litterateur* in Vienna—is another of those strong and sympathetic works of the prolific Ebner-Eschenbach. It makes its appeal to the same class as the preceding. For students more advanced in the knowledge of German, the travels of Goethe in Italy and the famous *Harz-*

The French list has one sea story of Compayré, the well-known authority on pedagogics, for first or second year work; an edition of Hugo's *Les Misérables*, which is, indeed, an event in this field, for few books in any language can claim the hold that this work has upon the youth; *Selected Poems of Hugo*, beautifully bound in green leather, evidently for the private library; a new edition of Corneille's *Le Cid*; an elementary French grammar on the private school pattern; a study of the French verb, with exercises, an able compendium for third or fourth year classes; and a drill manual of prose compositions based upon M. Guerber's *Contes et Légendes, Ire Partie*.

Greek and Latin

- Xenophon's Hellenica*. Selections. Edited by Carleton Beals. Boston: Houghton Mifflin Co. 1900.
A Short Grammar of the Greek New Testament. By A. T. Robertson. Armstrong. \$1.50.
The Agricola of Tacitus. By Duane Reed Stuart. Macmillan. 40 cents.
Selected Essays of Seneca. By Allan P. Ball. Macmillan. 60 cents.
High School Course in Latin Composition. By Charles McCoy Baker and Alexander James Inglis. Macmillan. 40 cents.
Social Life at Rome. By W. Warde Fowler. Macmillan. \$2.25.

The *Hellenica* of Xenophon is somewhat somber and annalistic, tintured with a tendency favorable to the Spartans. The desire and hope of Athens to regain her prestige in Greece was pathetic. She was shortly doomed to play a rôle far less glorious than that which she had played at Salamis and Plataea. Alexander came upon the scene. Greece was submerged. The resultant was a thin veneer of civilization, which spread far and wide in the East. The introduction, even if it does follow a beaten track, is worthy of some praise. Dr. Brownson has done all that any one could do to enliven the *Hellenica*. But it remains dull compared with the "Anabasis," in spite of its having a larger theme.

The work on the New Testament bears the stamp of painstaking, even if it does follow a beaten track. It has been long ago anticipated by the German, Wimer. It is, however, no small merit to reproduce the German in English, and in our language such a work was much needed. Stuart's *Agricola* is brought out with a winning simplicity, "excluding works of a technical nature and books written in foreign tongues." It is true that he does not wholly exclude them. "In mercy to the student," he says, "the intricacies of textual criticism have been kept in the background." He cherishes an antipathy toward conventional phraseology, and puts things in a different fashion from what the reader expects, showing a taste for pithy sayings. We have here a *nutshell in prose*. The kernel is contained in thirty pages and Tacitus is before us.

In the *Paras* of Seneca we do not always find dignity combined with power. In his death, however, there was a certain dignity, with perhaps a little parade. He was not a Socrates, who lived little for his life, provided he

could teach a high and heroic philosophy. Tho we may not call Seneca a hero, his literary work was not to be despised. His translations of the Greek poets had some merit, and his satire on the "Apotheosis of Claudius" was keen.

Baker and Inglis's *Latin Composition* is simply an exercise book following the usual round of drill by two instructors in the Horace Mann High School of Teachers' College, Columbia University.

It is not long since Mr. Tucker presented "Life in Ancient Athens." And now Mr. Fowler gives us *Social Life at Rome in the Age of Cicero*. There was certainly an opening for a good book here in spite of other works concerning the same ground, and we mention it with these school books because it will find its chief use as side reading in connection with the study of Cicero's works, giving to the student the broader outlook on the ancient world which is now demanded in classical education.

Spanish and Italian

- Spanish Grammar*. Edited by Carlos F. G. American Book Co. 65 cents.
Spanish Tales for Beginners. By Philip G. Heath. Heath. \$1.
Spanish Reader. By Charles Alfred Turrell. American Book Co. 80 cents.
Spanish Anecdotes. Edited by C. H. G. gent. Heath. \$1.25.
Spanish Grammar. By A. Adal Costa. New York: D. Appleton & Co. \$1.

Baltasar, the fine biblical drama of Señora Avellaneda, considered by some French critics to reach the level of Racine's "Athalie," would seem at first sight hardly the kind of book to improve one's conversational Spanish. But, altho written in poetry, the language is simple and natural, more so even than that of many plays written in prose. The author was a native of Cuba, and we may therefore claim her as an American. The *Spanish Tales for Beginners* are marked with certain features that will meet the approval of the practical teacher: They are good literature, they depict modern Spanish life, they are interesting, and not too difficult in language and thought. Professor Giese's *Spanish Anecdotes* provides reading matter of a very simple and easy character. Turrell's *Spanish Reader* consists of extracts from the works of the most

popular writers of modern times, and are well calculated to interest the student in the literature of Spain.

An annotated edition of the *Inferno*, adapted for academic use as well as for the general literary public, is a decided novelty, and Mr. Grandgent is to be congratulated on the admirable manner in which he has carried out his purpose of enabling persons who have but a scanty Italian equipment to read the greatest of modern epics with no other aid than that of a dictionary. The notes, tho brief, are clear, pregnant and comprehensive, and explain almost every puzzling word and phrase in the text. The Italian grammar of Professor Arbib-Costa is the best work of the kind that has yet come under our notice; but it is not accurate enough in its phonetics and proofreading.

Biology and Nature Study

Essentials of Botany. By Joseph Y. Bergen. Ginn. \$1.20.

Gray's Manual of Botany. Revised edition by B. L. Robinson and M. L. Fernald. American Book Co. Pp. 926, illustrated. \$2.50.

Plant Study and Description. By W. H. D. Meier. Ginn. 75 cents.

Textbook of Zoölogy. By T. W. Galloway. Blakiston. Revised edition. \$2.00.

The Study of Nature. By Samuel C. Schmucker. Lippincott. \$1.25.

Practical Nature-Study. By John M. Coulter, John G. Coulter and Alice J. Patterson. Appleton. \$1.35.

Nature Study for Primary Grades. By Horace H. Cummings. American Book Co. \$1.00.

Birds in Their Haunts. By Rev. C. A. Johns. Revised by J. A. Owen. 256 illustrations in color by William Foster. Dutton. \$3.00.

Animal Life. By F. W. Gamble. 63 illustrations. Dutton. \$2.00.

How to Identify the Stars. By W. I. Milham. Macmillan. 75 cents.

How the World is Clothed. By Frank G. Carpenter. American Book Co. 60 cents.

Among the few biological books for use in schools and colleges published during the year, two botanical books deserve special mention. Bergen's *Essentials of Botany* is an expansion of the author's "Elements of Botany" into the course for a full year in high school. Gray's *New Manual of Botany* is the famous guide to our native plants brought into line with the most modern systematic botany. In comparing it with the previous (1890) edition, one is surprised at the vast changes made in plant classification in twenty years, and feels inclined to learn plants by their stable folk names until the botanists get tired of digging up pre-

historic manuscripts in the search of the earliest possible names to take the place of the ones which have become too well known and popular. In hundreds of cases the scientific names are not as they were in 1890, but the layman who is interested in plants will get comfort from the fact that the good old names in plain English have stood the test of time and serve as an index to the new scientific names.

In reading some of the modern pedagogical discussions on the teaching of botany in secondary schools one may get the impression that the making of an herbarium and analysis of "fifty flowers" has long since become a chapter in botanical history; but each year the publication of a special notebook and portfolio for such work indicates that somewhere on this earth plant analysis and pressing flowers is still popular enough to justify financial ventures by publishers. Those of us who had a taste of the good old way, which had much to commend it, will welcome the publication of Meier's *Plant Study and Plant Description*, with about forty sheets for modern laboratory notes in line with current textbooks of botany, an abundance of folded sheets with outline for plant description and space for mounting dried specimens, and a very convenient binder.

In zoology we have two importations from England and a revised edition of Galloway's text-book. The change of title from *First Course in Zoölogy* in the first edition to *Text-book of Zoölogy* in the revision is especially significant because it is advertised for secondary schools. For such schools it is certainly far too difficult as a "first course." In fact, it is a book better adapted to early years of college than to even a second course in high schools. The day is almost past when a book in science can afford to be advertised as "a text-book for secondary schools, normal schools and colleges." Discrimination in aims, subject matter and methods is the demand of the hour, and authors are rapidly responding by not attempting to adapt a single book to several stages and phases of education.

Within fifteen months four excellent guides for teachers of nature-study have

appeared. Holtz's *Nature-Study* arrived just in time for mention last July and seems to have stimulated the appearance of three formidable rivals, by Schmucker, Cummings, and Coulter and Patterson. In these books there is considerable similarity in the spirit and general plan, which is due not to originality or plagiarism on the part of any one of the authors so much as to the fact that all the authors have evidently kept closely in touch with the trend of the recent advances in nature-study. The first part of Schmucker's book, *Study of Nature*, deals with aims, purposes, and the general theory of nature-study; the second part deals with the materials; and the third part outlines a course of study. It will be very useful for teachers and for students in normal schools. Coulter and Patterson have packed into their *Practical Nature-Study and Elementary Agriculture* a large amount of useful material, but some of it is not approved nature-study. For example, hypocotyls, atoms, molecules, protoplasm, and photosynthesis are, to say the least, questionable topics for nature-study. In the introduction the authors protest against making nature-study from bits of the various sciences, and yet they have come nearer doing that very thing than any of the other authors of recent books. Perhaps this is the result of an attempt to meet the present market for books on agricultural teaching, and to do this by combining nature-study and elementary agriculture. With elimination of the numerous encroachments upon the field of high-school science, the book would be a useful manual for teachers of nature-study and agricultural nature-study in schools below high school. Cummings's *Nature-Study for Primary Grades* is a teachers' manual for the first three grades. The outlines are based on familiar experiences and facts, which commonly come within the experience of children; and hence the book ought to help teachers in any part of this country.

History, Civics and Economics

Students' History of Contemporary Civilization. Edited by James Allen James. Scribner. 1914.
History for Masters, Teachers, Pupils. By James Allen James and Charles A. Beard. Ginn. Vol. 1. 1914. Vol. II. 1915.

Economics. Boston Course. By Henry Rogers. Silver, Burdett. \$1.75.
Economics. By Scott Nearing and Frank D. Watson. Macmillan. \$1.90.

The range of teaching materials in history, civics and economics, especially for secondary schools, has been widened this year by the addition of a number of works by standard authorities like Professors Seignobos, Robinson, Cheyney, Reinsch, Jenks, Ely and Seager. Prof. J. A. James has brought to completion his English edition of *Seignobos's General History* by the publication of the third volume, covering the social and economic development as well as the political events of the period from the opening of the eighteenth century to the year 1888. Professor Seignobos, as every student of history knows, combines the rare qualities of a profound scholar and a skillful maker of school books, and we are fortunate in having in English dress his excellent series for secondary schools. It is only to be regretted that the editor did not make arrangements to bring the work up to date; in fact, this failure seems to be a fatal error for the purposes of a modern history. The recent American contribution to manuals on *Modern European History*, by Professors Robinson and Beard, has now been supplemented by two volumes of selections from the sources, so arranged as to enable the teacher to expand each chapter of the text by a corresponding chapter of illustrative materials. Professor Cheyney's *Short History of England*, in the same series, under the general editorship of Professor Robinson, is likewise supplemented by a volume of sources. The

fundamental idea in the preparation of these three volumes of readings has been to present, in clear and simple English, first-hand accounts from the works of contemporaries in such a form as to give vividness and reality to the necessarily compact statements of the manuals. It seems too late now to discuss the desirability of the source method of instruction; practice has confirmed its utility. The new volume in the Cambridge Historical Series is a *History of Italy*, from the great French and Spanish invasions to the eve of the French Revolution, by Mrs. H. M. Vernon, already known to students of Italian history. thru her excellent little volume

on Cosimo de Medici.

A volume in the Cambridge Series needs no comment; it is authoritative, scholarly, essentially political, and dry. The long list of textbooks in *American History* for secondary schools—to the making of which verily there is no end—has been increased by a new volume by Professors James and Sanford, whose book on American government has been so favorably received. This manual follows traditional lines, with the exception of a somewhat greater stress on the development of the West

than is common in books made in New England, and excites no considerable feeling one way or the other. Professor MacDonald has reprinted in one volume some of the most important documents and papers contained in his admirable series of sources already so well known to students of history. The selection is made judiciously, and the volume is, in scholarship and practical utility, equal to the editor's previous works; beyond this great praise a reviewer could scarcely go. There is good history, also, tho not

of the "documentary" sort, in Roosevelt's Western tales, a collection of lively stories and sketches from his varied writings on frontier life. Somewhat in the same vein runs Katherine B. Judson's *Montana*, a rather unique bit of historical work designed to give children in proper sequence some of the romantic scenes from the early history of that State.

In the field of American government, we have two books for college and university instruction and three for children in the grades. Professor Jenks's volume is an edited version of the lectures recently delivered at Columbia

DESIGNS FROM NATURE STUDY LESSONS
From Cummings's "Nature Study."

University on the Blumenthal foundation; it does not pretend to be an analysis of the structure and functions of government, but is a study of some fundamental political questions—the suffrage, political motives, parties, legislation and administration—as they would appear to the average intelligent American citizen who tried to reason them out from practical considerations. The doctrinaire—radical or conservative—will receive scant comfort from these pages. Professor Reinsch has brought together a large and remarkably vital

collection of extracts from the *Congressional Record*, memoirs and other sources illustrating the actual operation of the various branches of the Federal Government. It is hard to imagine a better book on which to base a university course in that subject. The importance of carrying instruction in citizenship into our secondary schools, as well as our colleges, cannot be doubted; but the task of making government a living subject for children is unquestionably a difficult one. Dr. Forman attempts to solve the problem by teaching the child certain great principles of conduct for the home, school, local State and na-

tion and describing in a very striking and entertaining fashion the precise ways in which the great departments of a city government, such as the fire, police, health and street cleaning departments, come into practical relation to the citizen's welfare, and also how the citizen himself can forward the good work by proper conduct. It is true that the authors have designed this little book for supplementary reading, but, after all, it seems the very best way to teach citizenship; that is, to engage the pupil's interest and get him to care about his government and what it does; he will discover the necessary political machinery soon enough.

But what about the girls in the schools? Professor Dealey, in his *Development of the State*, teaches civics by the historical and evolutionary method, tracing the origin and growth of the various functions of government and giving occasional suggestions as to probable or desirable changes in the future; a very comprehensive and useful little volume, interesting and unprejudiced.

In the domain of economics there are four volumes fresh from the press. Two of them are revisions, a third is a condensation of a larger work, and the

fourth is a new presentation of the subject. Professor Bullock has issued a third edition of his *Economics* (which has served as a standard text in many colleges for over a decade), with some revision and the addition of new chapters on finance and railway transportation. Professor Ely's *Outlines*, after fifteen years of effective service, has now been thoroly rewritten and enlarged; the result is a better book in every way. Professor Seager's volume is based upon his larger work, but it is simplified, and the practical part is enlarged so as to appeal especially to students of technical and professional schools. The newest venture in the field of economics, by Nearing and Watson, is certainly the most striking of the

THE HOUSE OF REPRESENTATIVES
FROM THE HOUSE OF REPRESENTATIVES

tional government, while incidentally conveying the more important facts relative to the organization and functions of government. Professor Reinsch gives even more attention to the human side of government, and at the same time deals satisfactorily with the technicalities of the subject; he treats rather fully such matters as highways, schools, charities, public works, forests, liberty, equality and patriotism. There is in both books too much patriotic rhodomontade about our perfection; but it seems that a certain degree of silliness in books on "civics" is necessary to their sale. Richman and Wallach attack the problem as it appears to the city dweller in another fashion, by leaving out of account altogether the forms of govern-

group, and it would be interesting to know whether it represents the tendency among the newer generation of economists. The theories of rent, profit, interest and wages are disposed of in half a hundred pages; "value" does not appear in the index or table of contents; it is a book about labor, business organization, trusts, railways, municipal monopolies, trade unions, open shops, "the square deal," single tax, socialism and Government regulation, and it closes with a positive program of social work. Shades of Ricardo! are these your sons? Surely in looking over this group of school books there is reason for congratulation—we are nearer to reality, more human in our views of history and politics, and more confident than ever in the future of democracy. The teacher has a great work to do, and the books for good work are better than ever.

Mathematics

- Trigonometry.* By Arthur G. Hall and Fred G. Fink. Holt. \$1.40.
Plane and Solid Geometry. By Elmer A. Lyman. American Book Co. \$1.25.
Standard Algebra. By William J. Milne. American Book Co. \$1.
Practical Elementary Algebra. By Jos. V. Collins. American Book Co. \$1.
Algebra for Secondary Schools. By E. R. Hedrick. American Book Co. \$1.00.
A Secondary Arithmetic. By John C. Stone and James F. Millis. Sanborn. 75 cents.
The Appleton Arithmetics. By J. W. A. Young and Lambert L. Jackson. Appleton. Primary, 35 cents. Grammar School, 55 cents.
Lessons in Telegraphy. A textbook for schools and individual students. By C. H. Sewall. Van Nostrand. \$1.00.

Almost all recent textbooks go to show that the days of the old-time, formal, disciplinary textbooks have passed; for the writers of books no less than philosophers have come to know that books as well as other things must have more than a disciplinary value—they must be practical, making for efficiency in some line of human effort. In no class of books was the need felt more up until recently than in the most formal of all the sciences—mathematics. Even what was known as "applied mathematics" had a delightful way of keeping clear of the concrete. In olden time men were taught to ascend into heaven by the discipline of mathematics; today we are told that even mathematics must rather "bake bread." So it is that Plato's test for the true thinker has become an instrument of service to the race. But to render an abstract science such as

mathematics practical means the preparation of many textbooks, with especial reference to the field in which it is to be applied; for the student who has familiarized himself with certain general, if not fanciful, problems, may be and generally is ill prepared to take up real problems in a given field. What such a book should be is well illustrated by the *Trigonometry* prepared by Prof. A. G. Hall, of the University of Michigan, and Mr. F. G. Fink. The book is published with especial reference to technological students and their needs are kept always in mind. In treatment, in general arrangement, as well as in the selection of problems, the authors have quite wisely kept close to the concrete. The more abstract nature of the function of the general angle is sufficient reason for considering this subject later in the work, while the arithmetical solution of angles comes in for an early treatment. The book is quite complete, containing as it does a chapter on logarithms, a table of logarithms, and an explanation of the slide-rule, which is strongly recommended as a check upon the numerical solution of problems.

Professor Elmer A. Lyman, of the Michigan State Normal, has proceeded upon the hypothesis that in mathematics as well as in other subjects the student's interest must be awakened, which means that the student must be allowed and encouraged to do much of the work himself; hence he leaves the proof of quite a large number of theorems that are usually proven outright either in part or entirely in the hands of the student.

In *The Standard Algebra*, by Prof. William J. Milne, of the New York State Normal College; *Practical Elementary Algebra*, by Prof. Jos. V. Collins, of the Wisconsin State Normal, and the *Algebra for Secondary Schools*, by Prof. E. R. Hedrick, of the University of Missouri, we have three standard textbooks for secondary schools. In each case the author has shown wisdom in the selection of his problems, which are as far as possible of a concrete nature. The book of Professor Milne is to be especially commended for its full treatment of factoring, the treatment of which is not infrequently crowded into too few pages;

while that of Professor Collins emphasizes probably more than has ever been done before the value and feasibility of checking up the answers to examples, thereby dispensing with the answer-book as far as possible. The work of Professor Hedrick, which in many respects is the most attractive of the three, was written especially for those students who can get no further than the high school. For this reason he has relegated to the appendix much that is usually met with in the body of the text, and that, too, without loss. Great stress is placed upon graphical illustrations.

In the publication of *A Secondary Arithmetic*, Messrs. Stone and Millis have followed to the extreme the doc-

More after the fashion of the old-line book and yet in keeping in touch with the new theories of teaching mathematics is the *Appleton Series of Arithmetics*. This series takes a very sane position, following the middle road between the two extremes of the old and new:

"In addition to giving proper attention to the culture value peculiar to the exact reasoning of the school mathematics, this book fully recognizes the utility of arithmetic. The problem material is rich in data drawn from the student's own experience."

Physics and Chemistry

A Textbook of Physics. By A. Wilson Duff et al. Blakiston. \$2.75.
Elements of Physics. By George F. Heath. Appleton. 1000 B. & C. Co.

A LEASH OF HOUNDS. BY ORKNEY.
 From Wilson's *Physical Study in Elementary Science*.

trine that the study of a textbook should result in practical preparation for the duties of life. They write:

"Such a course in arithmetic should be practical and informational. It should be free from pedantic and obsolete processes. It should set forth the actual business practices of the time. It should contain nothing but the processes actually used in commercial and industrial work today."

Physical Laboratory Handbook. By George A. Hoad. Appleton. 1000 B. & C. Co.
Physical Laboratory Handbook. By E. L. Hart. Appleton. 1000 B. & C. Co.
Electricity, Sound, and Light. By Robert A. Millikan and Lake Mills. Appleton. 1000 B. & C. Co.
New Laboratory Manual of Physics. By S. E. Coleman. Appleton. 1000 B. & C. Co.
Science at Home. By T. Baron Russell. Fenno. 75 cents.
A Textbook of Experimental Chemistry. By Edwin Jones. Boston. 1000 B. & C. Co.
Elementary Chemistry. By Hollis Gifford. New York: Longmans, Green & Co. \$1.10.

A Text-book of Physics, an excellent manual for colleges, is the common work of Professors Duff, Guthe, Hallock, Lewis, Goodspeed, Carman and McClung. The plan here employed renders seven experienced teachers jointly responsible for the text, and has the good point of having specialists to write with authority upon their own particular fields, into which they seem to have entered with enthusiasm in every case, in addition to the fact that all alike have taken a general interest in the work as a whole. If any one subject has been touched upon by more than one author, the student is certainly anything but a loser thereby. The book contains 666 pages—a rather extended treatment of the subject. The omission, however, of those parts in fine print will render the book serviceable for a briefer course.

Those acquainted with Professor Hoadley's previous work on *Physics* will be glad to know that he has published a concise new textbook, which retains all the good qualities of his other work, and that it is written primarily for those students just beginning the study of physics. *Applied Mechanics for Engineers*, by Prof. E. L. Hancock, is prepared for engineering students of the junior year at college. The author believes that problems in mechanics should be practical engineering problems, and in the writing of this book he has kept this idea well in mind. Especial attention is called to the chapters on moment of inertia, center of gravity, work and energy, friction and impact, as being very full treatments of the subjects. *Electricity, Sound and Light*, by Professor Millikan, of the University of Chicago, and Professor Mills, of the Western Reserve University, is a valuable text-book, built up around a laboratory outline, and put forth after much experience with the course in the classrooms of several universities, among others the two named above. The method of treatment is analytical rather than descriptive. The book is written for college sophomores. Sixteen of the twenty-eight chapters are devoted to electricity, while sound and light are allotted five and seven respectively. The book covers thoroly its limited field.

A new *Laboratory Manual of Physics*,

by Prof. S. E. Coleman, contains seventy-six experiments specifically designed to meet the college entrance requirements. *Science at Home*, by T. B. Russell, is a volume of simple experiments for young people, rather more novel, attractive and practicable than such books usually are.

A Text-book of Experimental Chemistry, by Prof. Edwin Lee, of Allegheny College, is a manual for the use of students of general inorganic chemistry. It is not intended to take the place of descriptive chemistry, but there are descriptive notes embodying discussions, applications, formulæ, etc., intended to make obvious the relationship of experiment to theory.

Godfrey's *Elementary Chemistry* is a reversion to an older type, to the descriptive, poetic and moralizing style of our forefathers, which has been replaced by the dry, mathematical and experimental treatment of the subject. Such a book as this is undeniably more readable, and it may, by its many references to the composition of common things, serve to interest some who would be repelled by a textbook of the kind now generally used, but it contains much that is not chemistry. Its illustrations, both the verbal and pictorial, are frequently far-fetched. For example, a picture of Trinity College, Cambridge, is introduced because Cavendish was educated there, and the author compares the symbols of chemistry with hieroglyphics, and backs up the simile with a cut of the Rosetta Stone. Many of our textbooks are weak on the philosophical side, but we have not for some time happened upon so amusing a confusion of conceptions as the following from p. 76 of Godfrey's *Chemistry*:

"The laws of nature, the great laws which underlie natural science on the other hand, are infallible, unerring, so that whether we wish or no they require obedience. For those who try to disobey them, the punishment is certain—injury or death results. High up on the snow of the Alps stand shelves of snow whereon crossing may sometimes be made. If the ice holds strong, the mountaineer can cross. If the sun melts and weakens the shelf of snow so that it can no longer bear the weight of the climber, the man who tries that path plunges headlong to destruction. He has disobeyed the laws of nature. The force downward of gravitation was greater than the supporting force which acted upward."

Music and Art

The Elementary Music Course. By Ida Prentice Whitcomb. American Book Co. Book I, 25 cents; Book II, 30 cents; Book III, 40 cents; Book IV, 50 cents. *Picture Study in Elementary Schools*. A Manual for Teachers. By L. L. W. Wilson. Macmillan, \$1.00.

ite songs for school and home. Edited by Clifton Johnson. American Book Co. 50 cents.

Aiken's Music Course. By Walter H. Aiken. American Book Co. 50 cents.

Young People's Story of Music. By Ida Prentice Whitcomb. Dodd, Mead. \$2.00.

Picture Study in Elementary Schools. A Manual for Teachers. By L. L. W. Wilson. Macmillan, \$1.00.

The head of the department of music of the University of Chicago School of Education has drawn upon the children's song literature of many nations for the *Eleanor Smith Music Course*, her endeavor being to present music which shall assist in the best technical and artistic training possible to children. So far as we have been able to observe, practically everything in the four books possesses genuine artistic quality—that is, is worthy of inclusion in such a course. Many folk-tunes as well as songs by eminent composers are included, and the whole has been carefully graded as regards difficulty and musical maturity. Mr. Aiken, who is supervisor of music in the Cincinnati public schools, has prepared a music reader in which he has essayed to take up systematically the simpler elements of instruction, to present them clearly, and to illustrate them copiously with single-voice songs and part songs. A big book for little folk has been made by Ida Prentice Whitcomb in *Young People's Story of Music*. The author was actuated by a worthy motive in attempting to tell a "story" that would "enable young readers to listen more intelligently and with greater enjoyment to the opera, the symphony, the oratorio and all the modern forms of good music," but by trying to include something about all those forms and something about the lives of all the leading composers she has made an unwieldy book of very uneven interest—more or less of a hodge-podge of information, some of which is none too accurate.

In the ten years since their initial publication Wilson's two little manuals on *Picture Study in Elementary Schools* have proved a boon to many a teacher awakening to the value of beauty in the school room, for they provided a unique and a potent aid for imparting to children

the beginnings of a true appreciation of and love for the paintings by the world's great masters. This new edition puts the two parts in one volume.

Education. By Ralph Waldo Emerson. Riverside Educational Monographs. Houghton, Mifflin. 35 cents.

During the past year the eloquent Professor Kuehnemann, of Breslau, has held for the second time the Kaiser Wilhelm exchange professorship at Harvard. His little volume on *Charles W. Eliot* is at once a tribute to the retiring Harvard president and an attempt to interpret to the German people something of the significance of Eliot's life and work. It is not, like Fräulein Müller's fascinating life of Carla Wenckebach, primarily a study in personality. Rather is it a study of ideas—of the democratic ideals which have dominated Eliot's social and educational philosophy, together with a description of their unfolding in the evolution of Harvard University. Fräulein Müller has a story to

tell—the story of a vigorous Frisian baby, ambitious and impulsive Hanoverian schoolgirl, adventurous governess in the distant Caucasus, and, finally, Wellesley professor, rugged, scholarly, inspiring.

The head mistress of the Manchester High School for Girls, Miss Burstall, visited a number of American universities and city high schools last year, and now we have her well-stocked volume of observations and impressions. Miss Burstall finds it hard to understand the paucity of women in executive positions

then work with a greater zeal and effectiveness than when employing the more usual mechanical methods. Prof. Frank McMurry believes this so thoroly that he has written a book on *How to Study and Teaching Children to Study*, a book that will bring home to many teachers the conviction of a neglected duty and also point out to them the better way.

Both Miss Burstall and Professor Kuchnemann have been deeply impressed with the American's extraordinary faith in the importance and power of education. That this faith grips not only the

PESTALOZZI AND THE ORPHANS OF STANZ.

From Hoyt's "History of Modern Education."

in our schools. She is impressed by the degree of independence and power of initiative which American pupils exhibit in their school work. Dr. Earhart's investigation of the ability of elementary school pupils to study, to find the subject of the lesson for themselves, to organize the subject-matter, to verify the author's statements and supplement the text—sheds on the American schoolboy no such rosy light. The encouraging portion of Dr. Earhart's research is found in her demonstration that children in the fourth grade *can* be taught to study logically and systematically, and that they

populace, but some of the educational leaders as well, is evident to the reader of President Thwing's *Education in the Far East*. Industrial and technical training in India, moral and religious instruction in Japan, more numerous and better prepared teachers in China; these are the paramount needs of the Far East.

The lively interest of the American public in education gets sharply focused, our visitors remind us, on different problems from time to time. At one of these foci of interest today one finds the problems of vocational education. A recent number of the *Annals of the American*

Academy, given over entirely to "Industrial Education," contains more than a score of contributions from practical school men and writers who lead in social and educational thought. The treatment of this theme in Prof. A. H. Chamberlain's textbook called *Standards in Education* redeems an otherwise somewhat disappointing volume. "The Administration of Vocational Education" is the title of one of the best of the thirty-odd chapters in Dutton and Snedden's comprehensive and scholarly textbook in the important field of educational administration.

Professor Dinsmore's book of straightforward, homely advice on *Teaching a District School* gives the kind of help needed by an untrained beginner. If he wants to find out how to teach anything, from the three Rs to agriculture and singing, Dr. Boyer's *Modern Methods* will tell him—after a fashion. It is doubtful whether he could extract any inspiration from Dr. Felix Arnold's elaborately wrought *Textbook of School and Class Management*.

Teachers of psychology who believe that the "Dewey movement" is the most significant feature of contemporary education—and their number is increasing—are giving a warm welcome to Dr. Miller's *Psychology of Thinking*, for here the biological point of view, together with Professor Dewey's doctrine of the nature of thinking and its function in the reconstruction of experience, are worked out in detail, and in such plain language that the book may safely be placed in the hands of undergraduate students. If the reader desires to come into touch with Professor Dewey's thought at first hand, undoubtedly one of the best opportunities is provided in Part II of the Dewey and Tufts's *Ethics*. In this middle portion of the book Professor Dewey develops his conception of the moral situation as essentially involving a selection from among discrepant ends of action. Part I, by Professor Tufts, is a vivid and convincing portrayal of the beginnings and growth of morality in primitive life, among the Hebrews and the Greeks, and in the modern period. This historical method of approach at once simplifies

the problem for the student and gives him needed perspective. Another rather bold and successful innovation appears in Part III, where the ethical concepts and principles developed in the preceding chapters are tested by application to some of the large unsolved moral problems of contemporary political, economic and social life. Especially strong are Professor Tufts's chapters on unsettled problems in the economic order, and on the family.

Of the four authors of new textbooks in the history of education, Professor Graves, formerly president of the universities of Wyoming and Washington, treats his subject with the most breadth and adequacy. The two writers on modern education, Dr. Misawa and Dr. Hoyt, both cling to an ideal which we had hoped was on the wane. They would make the history of education course a study of the biographies and educational doctrines of a few representative educational reformers. Dr. Hoyt's brief text employs all the didactic devices of maps, chronological charts, outlines, lists of supplementary questions and the like, and even departs so far from the beaten path as to introduce full-page portraits of each of the half dozen educators studied. Dr. Misawa adopts none of these devices, but relies upon an unusually vivid, facile and graceful pen to illuminate the characters of his thirteen *Modern Educators*. Dr. Anderson has hit upon a taking title that will win for his book a quick entrance into numerous training schools, where every item of instruction admitted to the curriculum is challenged to show its direct bearing upon the problems of the common school teacher.

The Sage Foundation has let its inquisitors loose upon the schools. One of them has been trying to find out the proportion of pupils that drop by the wayside before finishing, and the number that repeat a portion of the work. Statistics are often dull and incomprehensible to the uninitiated. Mr. Ayers makes his figures comprehensible and they are startling. *The Laggards in Our Schools*, those who are older than they should be for the grades they are in, constitute 33 per cent. of all the

school children. Most of these 6,000,000 "retarded" children will not finish the elementary school, but will drop out at the age of fourteen, while they are still in the fifth or sixth grade. In the lower grades, the average rate of progress is at the rate of eight grades in ten years. "Our courses of study are fitted not to the slow child, or to the average child,

but to the unusually bright one." Another statement formidably supported with figures is that our schools are better fitted to the needs and natures of the girls than of the boys. Such a book, at once readable and scholarly, scientific and popular, critical and constructive, is typical of the best in educational literature.

RICHARD COCKBURN MACLAURIN

Who was inaugurated President of the Massachusetts Institute of Technology on June 1, 1900. He was born in Scotland, received his education at Cambridge, and has served as Professor of Mathematics at Wellington College, New Zealand, and as Professor of Mathematical Physics at Columbia

The Adamantine Mind

BY ALFRED AUSTIN

POET-LAUREATE OF ENGLAND.

I

Let the world change, we need not change;
Nor yield dominion of the mind,
But with ancestral freedom range
The mightier days behind.
Should Statesmen abdicate control,
They who should rule be toppled down,
Nought can dethrone the regal soul,
Or rob it of its Crown.

II

Against the adamantine will
Rebellion's billows vainly beat.
Let Insurrection rise and shrill
And scared Authority retreat.
Conscience surveys the rabble-cries
As mountains gaze on heavy main,
Unmoved among the loftier skies
By transient hurricane.

III

Be of good heart, then, wavering souls,
And stand upon the ancient ways;
The forward hours wise Time controls
Are but as righted yesterdays.
When disaffection's storm is spent,
Authority resumes its rod,
From continent to continent
Proclaiming trust in God.

Copyright, 1891, by Alfred Austin.

The French Anarchists

BY ALVAN F. SANBORN

This volume is a translation from the French of the book by Alvan F. Sanborn, "The French Anarchists," published in 1891. It is a translation of the book by Alvan F. Sanborn, "The French Anarchists," published in 1891. It is a translation of the book by Alvan F. Sanborn, "The French Anarchists," published in 1891.

THE winning of converts is the first desire of every convinced anarchist in France as elsewhere. "Woe is me if I preach not the gospel" and "Woe is you if you preach not the gospel" is the burden of his self-communion. The most simple and natural manner of nature of the case, for other ears than winning converts, whatever the doctrine concerned, is by the oral propaganda, and the most simple and natural form of oral propaganda, as well as the most effective, is the heart-to-heart talk with one's neighbors and friends. These heart-to-heart talks, however, are not, in the very those of said neighbors and friends, and,

except as the imagination and the insight of the novelist may succeed in reproducing them, are a quantity with which the general public can have nothing to do. Oral propaganda thru the "group" ("*le groupe*"), then, is the simplest oral propaganda of which a mere descriptive article can take cognizance.

The anarchist "group" is the loosest sort of an organization of which it is possible to conceive, so loose, in truth, that it is barely organic. Its identity is that of a brook and its consistency that of a cloud. It is dependent for its existence on affinities which did not exist yesterday and which may not exist tomorrow, and appears and disappears with equal suddenness. It has no conditions of membership. It has no officers. It has neither constitution nor by-laws and recognizes no precedents. Its numbers are limited only by the operations of the affinities aforesaid. Its place of meeting is the only thing about it with an approach to fixity, and even this may shift from café to wine shop, from wine shop to private dwelling, and from private dwelling to café or wine shop again. The programs of group meetings likewise vary with the ever-varying affinities on which the groups are based, but they may be said to consist, speaking in the large, of

"The reading of original essays and poems; reports on the progress of the cause at home and abroad; a consideration of the bearing on the cause of the latest events; an exchange of journals and brochures, accompanied by expositions and discussions of their contents; a volunteering of service for the tasks in hand; and untrammelled exchange of ideas, sometimes degenerating into dispute and boisterous disorder."

The groups keep up fairly close relations with each other, in spite of their fluidity and irresponsibility, thru the columns specially reserved for correspondence in the anarchist press—very much as do the local societies of the Boys' League, the King's Daughters and the Christian Endeavor Union thru their chosen organs. Thus:

"The group '*Rayon de Soleil*' would like to put itself into communication with other groups. Those who are willing to write us are invited to direct their letters to 13 Rue L—, Monmartre."

"Gustave Guinon, 5 Place de la Halle, Saint Chamond (Loire), desires to correspond with the *camarades* of the group of La Seyne sur-

Mer (Var) and with a *camarade* of La Ciotat. He desires also the address of Sabatino for an urgent affair."

"'*Les Resolus*' of La Charronne invites the groups of Belleville, La Villette, La Goutte d'Or and Ménilmontant to a meeting which will be held in the back room of the Silver Pheasant, Sunday, January 6th, at 8½ o'clock."

"Vanier, at Angoulême. Your idea is excellent. Since the municipality exacts the octroi tax of 16 francs on the Marennes* and 8 francs on the Portugaises* you have only to arrange to sell them in the country. This will make your profits bigger and at the same time will give you a splendid opportunity to spread the word. J. Mazel."

Union meetings of groups which are not too far separated from each other geographically are frequent, as the third of these notices indicates, but these union meetings can take no action that is binding on their component parts.

District, national and international anarchist congresses are held more or less regularly, at which the groups are represented by such of their members as choose to attend—their principles forbidding them to name formal delegates. None of these bodies, however, exercises any authority of any sort whatever over the groups. They are merely convenient arrangements for an exchange of ideas, and their power is purely moral, wherein they offer a striking contrast to the Socialist congresses, whose power not infrequently verges on the despotic.

Anarchist mass meetings are relatively rare, because large halls are too expensive for the anarchists' slender purses; because the proprietors of such halls are unwilling to let them to anarchists; and because the police are likely to forbid at the last moment the opening of their doors, even when the anarchists have succeeded in hiring them. But they contrive by the registering of bogus political candidacies to get the free use of national and municipal buildings at election time for meetings in which they preach, with superb irony, abstention from voting, and they are infinitely skilful in capturing and carrying on with their own speakers the mass meetings of the Nationalists, Radicals, Socialists, etc., by packing the hall and electing presiding officers of their own persuasion. This capture (to the end of which they do not hesitate to lay aside their scruples against parliamentary tactics) is not always ac-

* Two varieties of oysters.

complished peacefully. It often precipitates a general resort to fisticuffs, and has been known to result in bloodshed. Once a fight is on between the rightful occupants of a hall and the interlopers, only the evacuation thereof by the police or the turning off of the gas by its proprietor will secure order.

Joint debates ("*assemblées contradictoires*") likewise are almost sure to end, if these meeting-capturing anarchists flock to them, in rough-and-tumble scrimmages.

The anarchist, like other reformers, employs various innocent strategies for getting his doctrine listened to. He gives *punchs-conférences* (punch-talks) and *soupes-conférences* (soup-talks) and *déjeuners végétariens* (vegetarian lunches) in the winter, and organizes propagandist picnics (*ballades de propagande*) in the summer. He presents incendiary theatrical pieces, which are under the ban of the censorship, evading the law by issuing invitations and imposing a cloak-room charge instead of an entrance fee. Thus:

"The 'Groupe Germinal' (of Lyon) has organized for Sunday, January 24th, at 8 o'clock, Salle Charamande, Café de l'Isère, a theatrical representation by the *camarades* of the Théâtre d'Art. All militants are cordially invited.

"Obligatory cloak-room fee 10 sous.

"Invitations may be procured in advance at the Café de l'Isère or by applying to the Camarade J——, Number 19, Rue de P——."

The anarchist theatrical performance is frequently accompanied by a lecture which explains or supplements the teaching of the play, as is the practice in several legitimate Paris theaters dear to French bluestockings.

The anarchist combines pleasure and profit in "family nights" ("*soirées familiales*") also, to which, as to the theatrical performances, admission is by invitation only. Thus:

"'Soirée Familiale,' Saturday, February 6, at 8½ o'clock, in the Hall of the Café Barnave, Passage Barnave, close by the Grand, Maison Universelle. Address by the Camarade Emile J——, subject, 'L'Anarchisme à travers les Ages' ('Anarchy Thru the Ages'). Concert by l'Association Théâtrale, which will also present 'Le Fardeau de la Liberté,' by Tristan Bernard. The exercises will conclude with a ball and the drawing of a *tournoi* (lottery). Invitations may be procured at the Café Barnave. Obligatory cloak-room fee (which gives the right to a ticket for the *tournoi*) 10 sous. The *tournoi* prizes include oil paintings, bronzes,

books, etc., etc., more than a hundred prizes in all."

One's first impulse is to criticise severely the anarchist, who professes to hold gain in abhorrence, for appealing (thru a lottery) to the love of gain. But one recalls the church fairs and charity balls of "good society" and is humiliated into silence.

Another form of oral propaganda in which the French anarchists have great faith is the popular revolutionary *chanson* (*chanson populaire révolutionnaire*). Many of these popular revolutionary *chansons*—the majority, perhaps—are never put into type. They are transmitted from group to group, as were the folk-songs of yore, by such anarchists as are by nature lyrically inclined, particularly by the picturesque *trimardeurs*.* Such of the *chansons* as are printed retail at 2 sous each, and wholesale at 90 sous a hundred. They are sung in the public squares and on the street corners of the large cities by itinerant singers, who act as so many singing masters, teaching their audiences the words and airs of the *chansons* they sell them.

All attempts to establish a daily anarchist paper in France have failed, but the written propaganda of anarchy counts several weekly papers that may be reckoned prosperous as anarchist prosperity goes. The oldest and best known of these, *Les Temps Nouveaux* (ex-*La Révolte*, ex-*Le Révolté*), founded many years back by Pierre Kropotkin and Elisée Reclus, is an eight-page sheet, sold at 2 sous a copy. It is an exceedingly able and well-nigh dignified publication, almost as much read by the intellectually alert Frenchmen who are not anarchists as by those who are, in consequence of its literary supplement, which consists mainly of excerpts from the eminent authors, living and dead, who have exposed, without confessing themselves revolutionists, the injustices and corruptions of modern society.

The *Temps Nouveaux* is more especially the organ of the communist-anarchists. The *Libertaire*, a close second in age and in repute, emphasizes, on the other hand, the individualistic phases of anarchy.

*The *trimardeurs* are members of the great small-clothed companies of anarchists and hangers of France at one and the same time.

Scarcely a month passes that does not see the birth and death of more than one anarchist periodical publication in Paris alone. Consequently, any list of anarchist organs made out today runs the risk of being erroneous tomorrow. For the moment, the weeklies, fortnightlies and monthlies that are either anarchistic or so near to being anarchistic that anarchists are officially advised to read them are: *La Voix du Peuple*, *L'Action Directe*, *Pages Libres*, *L'Oeuvre Nouvelle*, *L'Ennemi du Peuple*, *Les Cahiers Féministes*, *Les Cahiers de la Quinzaine*, *Le Cri de Paris*, *La Bonne Lutte* and *L'Idée Libre*. The French fondness for almanacs is turned to the account of the propaganda by the publication of the *Almanach de la Révolution*, now in its fourth year (6 sous a copy).

The French art sense is similarly utilized by the issuance of reproductions (sold for home decorations at 10 to 30 sous and as illustrated postal cards at 1 and 2 sous) of anarchist drawings of remarkable artistic worth. Indeed, it may be remarked in passing, there is an intimate connection between anarchist thinking and the most advanced movements of contemporary French art which calls for a profound psychological study.

The anarchist papers and periodicals

"serve to keep the individual *camarades*, the groups and the *trimardeurs* in close touch with each other and with the whole anarchist body, as well as to narrate events, establish the real significance of the casualty columns of the bourgeois press, and expound the doctrine. They also lend themselves to mutual relief work—raising subscriptions for the *camarades* in distress from lack of employment, and securing comforts for the *camarades* in prison and for their families; signal *Mouchards* (police spies) and predict their movements; rehabilitate *camarades* unjustly accused of espionage; denounce the crookedness of employers; arrange for lectures; and, especially, utilize for the best interests of the movement the varied information gleaned here, there and everywhere by *trimadeurs*, who are for them so many unsalaried correspondents."

The anarchist press occupies an anomalous and difficult position in the newspaper world. The special obstacles with which it has to contend are legion. Among them may be mentioned:

I.—Lack of funds. Prevented by its principles from accepting the advertisements of capitalists, it is obliged to depend for its support on meager subscriptions, and when these are insufficient, as

is almost always the case, on the still meager contributions of the faithful.

The following balance sheet of the *Ennemi du Peuple* (2 sous a number and 3 francs a year) for one of its numbers illustrates admirably what the struggle for existence of an anarchist paper means:

No. 16. RECEIPTS: *Subscriptions* — Doré, 3 fr.; Clarin, 3 fr.; Heintz, 1 fr. 50; Garnery, 3 fr.; Le Pic, 3 fr.; L. Michaud, 3 fr.; Philippon, 3 fr.; Prudhomme, 1 fr. 50; Simon, 1 fr. 50; Fribourg, 3 fr.; Baudet, 1 fr. 50; Benon-Villiers, 1 fr. 50; Revillon, 1 fr. 50; Billon, 1 fr. 50; Pierre Martin, 1 fr. 50; total, 36 fr.

Sale—Raicter, 14 sous; Leglohahoc, 1 fr. 35; Kiénert, 4 fr.; Antignac, 3 fr.; Verplanche, 1 fr. 40; Paris, 25 fr. 85; Genteur (with subscription), 4 fr. 45; total, 40 fr. 75.

Contributions—Salle Jules, March 17, 4 fr. 50; Carteron and Michel, 3 fr.; Arthur Fen, 30 fr.; Ker Raicter, 2 fr.; total, 39 fr. 50.

Total receipts, 116 fr. 25.

EXPENSES: Postage and sundries, 21 fr. 85; printing, 108 fr. 75.

Total, 130 fr. 60.

Deficit, 14 fr. 35.

II.—The reluctance of lukewarm anarchists to put up with the inconveniences to which they are surely subjected if they are known as anarchists in their neighborhoods. "The wonder is," Augustin Léger makes his hero say in his novel, "*Le Journal d'un Anarchiste*," "that my concierge didn't take a pair of tongs to hand me my anarchist paper. He held it toward me with the tips of his fingers in a horrified fashion, full of bourgeois indignation at the idea that the *Père Trimard* came to one of his lodgers."

III.—The difficulty of finding a printer willing to print an anarchist sheet.

IV.—The unwillingness of the newsdealers to handle anarchist wares.

V.—The malice of the railway and post office authorities in delaying the transportation and delivery of anarchist printed matter.

VI.—The machinations of the secret police and the exceptional rigor anarchistward of courts and judges.

But there are no limits to the capacity

of the sincere anarchist for martyrdom. Anarchist proselyting zeal seems only to be whetted by these various obstacles, and combats them so courageously that it is permitted to doubt whether they are serious deterrents in the long run. When an anarchist periodical is suppressed by the Government, it is quickly replaced by placards and handbills, bearing no imprint, which are the bitterer and the more violent for being clandestine and irresponsible.

"Travailleur tu ne voteras point!

Soldat, tu ne tieras pas!"

is the significant title of one of these handbills which appeared recently.

When not angered by some direct insult, oppression or persecution of themselves or their constituencies, the editors of the greater part of the anarchist periodical publications show themselves more inclined to appeal to the intellect than to the passions of their public.

In fact, education and not excitement is the chief object of the more thoughtful and capable anarchists, and there is no section of the contemporary press where the observations on persons and events are more high-minded and sagacious, or where the fundamental problems of abstract and applied philosophy and ethics are studied with greater patience, penetration and thoroughness.

Anarchist periodicals are untiring in their exhortations to their readers to delve in the works of such world thinkers as Darwin, Spencer, Ibsen, Tolstoy, Leopardi, Björnsen, Maeterlinck, Schopenhauer and Nietzsche. They quote from these writers constantly, and keep on sale the cheapest editions obtainable of their works. They publish in pamphlet form (at 1 to 15 sous, 2 sous on an average) and in larger editions, selections from their own prophets and teachers: Proudhon, Stirner, Godwin, Bakounine, Buchner, Herzen, Palante, Reclus, Grave, Kropotkine, Louise Michel, Nieuwenhuis, Del Marmol, Lavroff, De lasalle, Cafiero, Malatesta, etc.

In truth, the more thoughtful anarchists are so possessed by the belief that the chief end of their propaganda is education in the largest sense of that word (*"l'éducation intégrale,"* to use their own terminology) that it is their pet dream to revolutionize the mental training of

children by founding schools for them which shall be free from the authoritative instruction that prevails in the educational institutions of the State no less than in those of the Church. Paul Robin's model school at Cempui (1880-1894) (which Tolstoy's model school at Yasnâia-Poliana closely resembles) was an interesting and fairly successful experiment along this line. Another relatively superficial but none the less interesting experiment is the publication of a child's anarchist paper (issued fortnightly, at 3 sous a copy), *Jean Pierre*, the text and illustrations of which are by recognized masters of art and literature.

The French anarchists, like Tolstoy, consider armies, taxes, courts of law and prisons as essentially vicious. They advocate, therefore, refusal to pay taxes, to do military service and to recognize the authority of judges, but they do this less with the idea that individuals will practice this highly dangerous refusal as individuals, here and now, than in the hope of developing gradually a rebellious state of mind so widespread that the refusal can be made ultimately without danger to individuals. There are a number of current practices, however, popularly regarded as duties, which scrupulous anarchists may refuse to sanction and do refuse to sanction without incurring more serious penalties, as a rule, than verbal abuse, ridicule or ostracism. These are: Voting at elections, marriage, the bringing of children into the world at the risk of their becoming victims of the lecherousness of the rich or the mercilessness of militarism (*"chair à plaisir et chair à canon"*), accepting interest for loans, going to law, taking oaths in court, indulging in luxuries for which the poor must pay sooner or later, currying favor with the wealthy, and the meek acceptance of the insolence of government employees, the brutality of the police, the criminal parsimoniousness of landlords, and the despotism of employers.

"For the majority of men," says the late Pierre Lavroff, "the propaganda by example is the only form of propaganda which can be successful; it alone changes habits of thinking and living. It modifies, in fact, a modification of the psychic dispositions of society; and it opens the way for society to be influenced by the energetic acts of exceptional individuals, for whom it prepares a receptive soil."

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

The Tariff Bill

IN conversation at the beginning of last week with journalists and others at the White House, Mr. Taft set forth his views about tariff revision, clearly indicating his purpose to sign the bill then in conference, and incidentally criticising with some severity the attitude and methods of the insurgent Republican Senators. Reports of what he said were published in many papers, and the reports were substantially identical. We refer now to what seems to us to have been the most interesting and significant of his remarks, that the object sought in the revision should be to prevent a further advance of prices by combined producers rather than to cause a reduction of them. Holding this opinion, he may find it an easy matter to sign the bill which the conference committee reported. By similar reasoning he could convince himself that a re-enactment of the present tariff ought to be approved at the White House.

But the people of the United States did not desire a re-enactment of the Dingley tariff, nor did Mr. Taft in his public addresses before and after his

election lead the people to believe that he favored a revision that would merely prevent an increase of prices. "The tariff ought to be lowered," he said. The Dingley rates "had become generally excessive." He declared that "revision in accordance with the pledge of the platform" would be, on the whole, "a substantial revision downward." We must be faithful to that pledge, or "suffer the consequences" which follow the breaking of a promise. Did any one who heard his speeches, or who read reports of them, understand that he desired, and that the platform demanded, a revision that would not reduce prices, but only prevent them from rising?

It was in September that he said the Dingley rates had "become generally excessive." In October, at Ft. Dodge, he explained that, under the normal operation of protection, the cost of producing was reduced, and that after a protective duty had been in force ten years it "ought to be reduced" because of the effect of it in cutting down the cost of production. But he must know that at the beginning of its term the Dingley tariff was too high for honest and reasonable protection, by the admission of the protectionists who made it. It was excessive even then, because they had made allowance in it for extensive reductions which were to be caused by treaties of reciprocity. A dozen such treaties were promptly negotiated under the direction of President McKinley, a loyal protectionist, but Mr. Aldrich and his associates in the Senate would not accept them. And so the excessive rates continued in force, "serving no useful purpose," as Mr. Taft said in his letter of acceptance, "but offering a temptation to those who would monopolize production in this country." To this temptation many of them promptly yielded, at the same time selling their products in foreign countries at prices from 10 to 40 per cent. below those which they exacted at home from their fellow citizens who had given them excessive protection.

A great majority of our people desired a revision that would restrain the greed of these over-protected manufacturers. They did not seek the destruction or the crippling of any domestic industry. They were satisfied that en-

forcement of the doctrine of the Republican platform concerning the difference in costs of production, according to Mr. Taft's interpretation of that platform, would compel a reduction of extortionate prices, not by actual competition from abroad, but by the menace of such competition. The Republican insurgent Senators, as a rule, have merely shown their appreciation of and their sympathy with this popular desire. Mr. Dolliver, for example, a loyal protectionist, has not sought to break down the protective system. He has merely opposed the abuse of protection, attempting not only to prevent unwarranted increases of rates already "excessive," but also to introduce a little reform affecting the defective foundations on which these increases were to be built up.

If the revision that was promised was to be one that would merely keep prices from rising, the promise has not been broken by the greater part of the bill which the conference committee reported. In several schedules, however, notably the one relating to cotton goods, it invites higher prices and offers that temptation of which Mr. Taft spoke in his letter of acceptance. But if the promise was that rates "generally excessive" should be reduced, and with them the cost of living, which has risen by 30 or 40 per cent. since the Dingley tariff was enacted, it has been broken, and the failure to keep it cannot be concealed by Mr. Payne's misleading table concerning this country's entire consumption of commodities, both domestic and imported.

It is true that the conference committee's bill was improved in spots by the President's influence, but he got only half of the free list upon which he originally insisted, and the effect of the reductions due to his attitude will be scarcely perceptible to the average consumer. Probably the relief given by them will be outweighed by the new burdens imposed in the cotton goods schedule alone for the benefit of Mr. Aldrich's friends. The reduction of the already low duty on bees, which has been a leading subject of discussion, affects an industry in which it is well known that free competition prevails. The consumer would gladly exchange

this reduction and the free-listing of hides for a just revision of the duties on woolen and cotton goods and of rates that are abused by greedy combinations. As for the reductions in the iron and steel schedule, as a rule they will not be effective. We have Mr. Carnegie's testimony that the steel industry needs no protective duties whatever. Incidentally it may be mentioned that prices of steel products have been advancing during the last two weeks and that further increases are expected.

We presume that the bill will be passed in the Senate this week, and that the President will promptly sign it. This he can do without any serious qualms of conscience, if all along he has been seeking only such a revision as would prevent a rise of prices. But the people have been led to believe that such a revision would not satisfy him.

Selecting Immigrants

THAT our regulation of immigration has as yet become even an approach to a satisfactory policy no one who really understands the problem believes. Only the theoretical cranks of politics would stretch our welcome to the opprest of all nations so far as to invite jail birds, dissolute persons and defectives that must become a public charge. On the other hand, it is stupidity to turn away healthy, able-bodied men and women of good character on account of poverty. Not only is their labor needed here, but so also is their unimpaired vitality to invigorate the American blood and maintain a normal birth rate. Something more than "shake-ups" and administrative changes at Ellis Island is needed to improve our dealing with the flood of immigration. We need much study of the subject by the people, to the end that we may have an informed and reasonable public opinion on the subject.

It is pleasant to turn from the mistakes, and worse, at Ellis Island, to the efforts that some of the interior and Southern States are making to obtain from among the new arrivals a desirable addition to their rural and industrial populations. Some time ago South Carolina and Louisiana began systematically to encourage immigration into those States.

They did not leave the matter wholly to chance, but, thru various agencies, undertook to obtain families and individual laborers that promised to be in all ways desirable citizens. We understand that the experiment has met with encouraging success.

More recently, Missouri has adopted a similar policy. The State authorities, with the active co-operation of Governor Hadley, have been studying ways and means to increase the value of farming lands, especially by attracting energetic settlers and laborers, and the Missouri State Society of New York has brought about an arrangement between the authorities at Ellis Island and the Missouri State authorities, whereby a competent agent stationed here will induce immigrants of the right sort to look for homes in Missouri.

Work of this kind should be done on a large scale, and, if it were, we should soon discover that our "immigration problem" had ceased to be alarming and it would not long be even troublesome. This country offers a great variety of opportunities, and immigrants that lack the instincts and the energy to become good farmers could, with intelligent direction, be placed where their services would be of maximum value. Coming to our shores without knowledge of the country, or means to travel, they stop in the Eastern cities, where unskilled labor is often superabundant, and their congestion produces the undesirable conditions which we too hastily attribute to immigration itself.

Obviously it is not the interest of private parties to direct the extensive and judicious distribution of immigrants. State authorities are on all accounts the proper agencies to conduct this undertaking. The resources and industries of the different commonwealths are unlike, and each State is the best judge of the kind of new citizens it wants. Undertaken by State authorities, the distribution of immigration would be at the same time a selection by each region of the population best adapted to it, and not an arbitrary "placing out" of a nation's wards, often with little appreciation of the fitness of things, which distribution by a Federal bureau might become.

Perhaps a Federal bureau for this work

is needed, and it is not improbable that, with our present tendency to centralize governmental functions at Washington, a Federal agency of some kind for this purpose will be created. This possibility increases the importance of State activity meanwhile, because a national distributing agency could accomplish good results only with the co-operation of the State governments.

One More Co-operative Effort

DR. FREDERICK VAN EEDEN, the distinguished poet, novelist and dramatist of Holland, with whose writings the readers of *THE INDEPENDENT* are already familiar, is in the field with a somewhat remarkable scheme for settling a large colony in North Carolina. He has got a number of men interested in New York City, and has secured an option of 11,000 acres of land near Wilmington. He proposes a co-operative company, aiming to produce wealth from the land that shall entirely revert to those who produce it. He proposes community of interests, best scientific knowledge in the working of the property, elimination of waste in marketing, saving effected in purchasing, and honest as well as capable management.

The capital stock of the company is to be \$500,000, which is to be used in the purchase of the 11,000 acres, preparing the land for small farms, building houses, and arranging for market and incidental expenses. This will make the farmer his own landlord, and give him a return for his labor so satisfactory that Dr. Van Eeden believes the temptation to go back to the city will be eliminated.

The trial is worth the while, but it must not for one moment be forgotten that a very large part of those who drift into city life drift from more favorable conditions in the country—or they so have been drifting. The tendency outward—that is, back again into the country—which is growing in force, is a tendency that has to deal with instincts and overcome them. Those instincts include a love of company, and a preference for those forms of labor which give regular hours, and the fewer the better. It will be impossible to sever farm life

from long days of toil. The only escape will have to be by ennobling labor, and charging it full of enthusiastic interest.

Dr. Van Eeden has foreseen some of the difficulties that we are suggesting. He is by no means resting on the idea that his company or colony will be satisfied with equal sharing of profits. He will add co-operative stores, combine industrial enterprises, such as dairy and canning factories. Better yet, he will try for an education of wide scope that shall train the settler for his work. Managers and wage-workers will be paid according to the wages in the labor market. The money raised will be turned into assets of real estate, which by the labor of the settlers will continually increase in value, but remain common property. The company will seek fair profits, without speculation; but all profits will become common property, and will be used to enable more workers to join the community. The general manager is to be appointed by a board of trustees, and the trustees elected by the members at large.

The enthusiastic hope of our Holland friend and poet is to establish a nucleus of workers of high efficiency, who will get trained in co-operative methods, and thereby make co-operation a public sentiment. He thinks that this can be done by giving to each member of his company all the advantages of ownership, without being able to follow its abuses. He must not have the full title of the land, and yet he must be practically owner. He will have to submit to strict supervision regarding his products, as the company will be responsible for the goods marketed; and he will also have to submit to strict rules of hygiene and sanitation.

Of course, we are glad to see any effort for the amelioration of our rural conditions tested. We still remain convinced that we shall have to follow rather than lead in this country-home movement. So far it has got its strength by means that we could not have foreseen. It is the agricultural college, with its experiment stations; it is the change of frontage toward industrialism in our schools; and it is the enlargement of country life with the trolley, telephone and free mail delivery that have been

doing the work. We are inclined to believe that it is by putting our efforts behind these agencies we are to achieve the re-establishment of a right sort of country life. Make country life attractive, open its poems as well as its storehouses, teach the rising generation to see these things, and you cannot keep them out of the country. The establishment of postal savings banks and a parcels post are our next efforts in this direction. We must pull all together until we have taught our politicians that they must obey the instincts of the people.

Still it is only by countless experiments, whether with Nature or human nature, that the better way is discovered, and we accordingly shall watch Dr. Van Eeden's experiment with much interest.

Maternal Care and Infant Mortality

PROBABLY one of the most interesting papers that has been written on the death rate of children in recent years was that by Dr. Stowell, a visiting physician to the New York City Children's Hospital and Schools, which was read not long ago before the New York Academy of Medicine. Ordinarily it is assumed that, because of the progress of scientific medicine and especially of the science of pediatrics, there has been a great reduction in the death rate of very young children, that is, under one year of age, in recent years. Careful studies have been made of infant feeding and diligent observations accumulated in institutions of all kinds and in private practice, until there seemed to be no doubt that science was doing much to keep young children alive who formerly succumbed to the dangers incident to unsuitable food. The statistics collected by Dr. Stowell do not confirm this conclusion, however, but serve to show very strikingly that it is the personal care and attention of the mother or the nurse of the infant, and not our scientific progress, that accomplishes results in reducing the infant death rate.

As a matter of fact, surprising as it may seem, the death rate of children under one year has not been materially reduced in the last forty years, if the available statistics are to be accepted as

representing the truth of the situation. This is true for all of the countries of Europe, and therefore there seems no doubt that the statistics must be considered true to life. In England, for instance, the death rate per thousand living for the five years before 1880 was 145. For the ten years from 1893 to 1902 it was 152. Not a single bit of improvement is manifest, tho the English physicians have been particularly diligent in their work on infant feeding. In France the deaths per thousand living for the five years before 1880 was 163. For the five years before 1902 it was 158. In Prussia the story is the same. For the former five years 205, for the latter 199. - In the United States, for the former five years 166, for the latter 165. It is true that in Italy the death rate for the five years before 1902 is only 173, as compared with the five years before 1880, which was 249, but there seems to be another factor, a rather large reduction in the birth rate, which complicates these statistics. There are more detailed statistics for the United States. Deaths are registered in such a way as to be available in this country only in one-half of the population; that is, in the cities of over 8,000. In the registration area the deaths under one year of age for every thousand deaths were in the various decades as follows: In 1860, 207; in 1870, 229; in 1880, 231; in 1890, 234; in 1900, 191; in 1906, 202; in 1907, 190. In nearly all countries there was a maximum of infantile deaths about 1890, since when there has been a slight improvement, but that improvement has not yet brought us beyond the figures of earlier decades, about 1870.

The most important factor in infantile mortality is the lack of the mother's care or such imperfect maternal care as makes the child practically an orphan. Dr. Stowell shows by statistics in and around New York City for the last half century that without a mother's care an infant has four times as many risks of dying under the age of one year as with a mother. In certain parts of England the death rate of illegitimate children is nearly twice as great as that of the legitimate, because of the frequent neglect by the mother and because they are so often sent to overcrowded institutions, where

they die in large numbers. In Washington the death rate of negro children is seven times that of white children, because negro mothers so often neglect their babies. During the American Civil War there was a great falling off in infant mortality in the manufacturing cities of England. The cause of this was directly traced to the war. The South ceased to a great extent to export cotton to England, and many of the factories in which mothers used to work were closed, and they had perforce to stay at home, with the result that their infants were nursed regularly and had a mother's care, and survived.

It is often said that density of population makes a great difference in infant mortality, but, as Dr. Crowell points out, it is not so much the density as the condition of living of the population that makes the difference. It is perfectly possible for a large number of people to be housed on a limited area of land in excellent hygienic condition. Dr. Stowell cites the example of the Ansonia, New York's largest apartment hotel, which covers 1.6 acres of ground and houses 2,000 persons in 2,500 rooms. This makes a density of population per acre of 1,262, almost as dense in this respect as the notorious Chrystie street block, which has 1,280 persons to the acre. In the seven years since this hotel was open there has been no infant death there, nor has an employee, of whom there are 400, given up employment because of tuberculosis. All rooms open on the outside, and the building has sixteen inhabitable floors, so that in reality the persons living here occupy 26 acres of floor area. This shows beyond all doubt that, with modern hygienic methods of building in large cities, it is possible to have great density of population without a high death rate.

The one important factor for the reduction of infant mortality that Dr. Stowell has found is the personal, intelligent care of the infant. The best work has been done in France by encouraging mothers to nurse their children and by having them come back to the hospital every week to report with regard to it. In England the Mayor of Norwich offered a prize of a pound sterling to every infant alive at the end of its first year. This

made an excellent opportunity for trained visitors to inspect the children occasionally, so as to advise mothers with regard to the care of their children. Usually this proceeding is resented, because mothers are perfectly sure that they know their own business. Just as soon as it became clear, however, that such advice helped them to the gaining of the prize and to that proud moment when they could exhibit their year-old child in public for its reception, then the advice was received very willingly.

The New York Association for Improving the Condition of the Poor has, as pointed out by Dr. Stowell, accomplished very much in recent years by this same method of maternal instruction. The Caroline Rest Fund of that association centers its attention upon the mother. Their nurses instruct the tenement mothers before confinement as well as giving advice after the child arrives. The work is new, but the results published in 1908 for over 300 cases shows that the infant deaths in cases visited before confinement were scarcely one-third the number occurring where visiting began only after the birth. Evidently what is needed more than anything else is the proper instruction of those who care for children, and as far as possible the securing of the mother's whole time for this purpose. Mothers who work lose their children in very large proportion. Mothers who are ignorant but devoted are quite as unfortunate. Probably 50 per cent. of the deaths are preventable, and prevention is much more a matter of humanity and simple knowledge than of scientific advance.

The Censorship of Books

THE Encyclical on Modernism has, as THE INDEPENDENT pointed out some time ago, a special warning to superiors of religious orders not to allow anything to be published by any of their subjects without their own permission, and also that of the ordinary. All religious were hit by this new law, except the Jesuits, who in restraints of this sort deny that they are religious and claim to be Clerks Regular.

Perhaps the first use of this power has just been made by the Archbishop of

Paris. Quite a noted Dominican preacher, Père Gaffre, who is on the staff of the Royalist journal, *Le Soleil*, has just published the sermons preached last Lent in the Royalist Church of Paris—St. Clotilde. When, in obedience to the Encyclical, the book was submitted to the Archbishop, he required that *sixteen pages* be stricken out. They contain a fierce, unchristian attack on the Jewish people, who, said the writer, are the original authors of the sin of "anti-patriotism," i. e., Republicanism. The privilege which Jehovah had given the Jews by making them His chosen people has fallen to France, which for fourteen centuries has been loyal. But the Jews have sworn that France shall cast off this zeal of the House of God and therefore they inaugurated the Republic—always "anti-patriotism" in the words of the friar. Next they joined hands with Free-Masonry with the same end in view. Lastly they dispossessed themselves of landed property and turned their wealth into personal, stocks, bonds, etc., ever, of course, to carry on the work of "anti-patriotism." Property in land, so teaches this French friar in unison with Archbishop Corrigan's attack on Henry Georgeism, is the primordial and natural law established by God, while personal property is the Golden Calf, to worship, which is "anti-patriotism," i. e., Republicanism. Here Père Gaffre seems to re-echo the teaching of the Catholic Church on interest. Never has she approved interest, looking upon it as usury. With the growth of modern industrialism Rome has been besieged times without number on the lawfulness of taking interest. The answer has ever been the same: Let the people alone. "*Non sunt inquietandi fideles.*" There are still living the children of a Catholic gentleman of Vermont—the owner of considerable stock—who was obliged, whenever he went to confession, to pass over into Canada, because his own pastor held that interest was usury and would not absolve the stock-holding penitent.

The *Libre Parole*—the organ of Drumont, the Jew baiter—secured the suppressed matter and is publishing it in long extracts, expressing, meanwhile, admiration at the rhetorical style and also at the truthfulness of the details, but sur-

prised that there could be found any criticism of the Church in those suppressed pages. No doubt the Jesuits are laughing in their sleeves at the discomfiture of the Dominicans. But Mgr. Amette will find that he has stirred up a hornet's nest about his ears, for Jesuit, Dominican, Franciscan and all the rest will turn on him. Already the first buzzing is in the report that the Archbishop of Paris keeps his moneys with the Rothschilds, the well known Jewish bankers. There's the rub, perhaps?

The Coming New York Campaign

The forces in New York are now beginning to line up for the fall mayoralty campaign. Already "The Committee of 100," which represents the large independent sentiment of the city, has been organized and is in the field. The Republican machine, the Citizens' Union and the Hearst Independence League are also showing signs of activity, while the usual small fry "strike" parties are springing up overnight like mushrooms. Tammany, the common enemy, will scarcely let the billion-dollar budget slip by without a death struggle, and it will obviously be requisite for her to split the Fusion forces to insure another four years' feeding at the public crib. Plenty of second-rate candidates for Mayor are in the field, but there is no "logical" candidate in either the Tammany or Fusion forces. This is the year for the unknown man. As the traction issue is likely to be the dominant one, no conservative man of the Chamber of Commerce type will have the ghost of a show to win on either ticket. The entrance of the Citizens' Union into city politics in 1897 taught the people that the parties organized on national lines were not thereby fitted to run municipal campaigns; the success of the Fusion movement in 1901 taught the voters that an independent ticket could be elected in New York; and the phenomenal vote for Hearst in 1905 showed that the labor men and the masses can be weaned from Tammany, provided platforms and candidates are offered them whom they can trust. With a progressive platform and candidates

sound on the traction issue, Tammany can be defeated this year. If "The Committee of 100" can bring about a fusion that will be acceptable both to the anti-Tammany forces and to the voters at large, Fusion should have an easy victory. The "Committee of 100" holds the key.

His Plea the Statute of Limitations

A shameful record has been made by the Sugar Trust and its agents. Found guilty of cheating the Government by means of fraudulent weighing machines, it was forced to pay into the Treasury more than \$2,000,000 which it had gained in this contemptible way. Sued for damages by the receiver of a Philadelphia bank that had been wrecked by its plot against Adolph Segal's new sugar refinery, it virtually confessed its guilt by paying \$2,000,000 for a settlement. But the facts brought to light before the discontinuance of the suit so clearly indicated a violation of the criminal provisions of the Sherman act that the Government took up the case and speedily procured the indictment, a few weeks ago, of the Trust's officers and Gustav E. Kissel, a banker or broker, who, acting in the interest of the Trust, had obtained for Segal the loan by means of which the latter's refinery was closed. Now an addition to this discreditable record is seen in the plea of Kissel to the court. He asks to be freed from indictment because of the statute of limitations. That is to say, he asserts that he was not formally accused until more than three years after the offense in question was committed, and therefore cannot lawfully be prosecuted. Such an appeal to the statute of limitations does not commonly commend to the public the man who makes it. The prosecution of the eight indicted men by the Government should be earnest and vigorous. If found guilty, they should suffer the full penalty of the law.

A Woman Superintendent of Chicago Schools

Those who are interested in the advancement of women will rejoice at the election of Mrs. Ella Flagg Young to be

superintendent of the public schools of Chicago. It is a position of almost as much dignity and of more influence than the presidency of a great university. When E. Benjamin Andrews resigned the presidency of Brown University and took this office he was not regarded as being reduced in rank. The salary is \$10,000 a year, the same as is received by Superintendent Maxwell, of New York City. There were many strong candidates in the field and their claims have been urged upon the board ever since the resignation of Edwin C. Cooley a few months ago. The board preferred a Chicago teacher to any outside candidate and finally to settle the matter the chief applicants, five men and one woman, were called before it in alphabetical order and questioned as to their educational aims and principles. At the conclusion of the session the position was awarded to Mrs. Young by a unanimous vote. Her closest rival, John D. Shoop, supervisor of vacation schools, is given a new office of assistant superintendent, and is in line of succession. What is more remarkable, considering the tendency to lower the limit of superannuation, Mrs. Young is sixty-four years old. She was born in Buffalo, N. Y., and has taught school ever since 1862. She was the first woman to become district superintendent in Chicago and held the office from 1888 to 1899 when she resigned because she believed that Dr. Andrews interfered with her methods. She was professor of education in the University of Chicago from 1899 to 1905, and has edited the *Chicago Bi-Monthly* since 1896. Misogynists have been compelled to admit that women could teach, even in the higher grades, but they have clung to the opinion that women as a rule are incompetent to fill executive positions. That opinion may be correct—as a rule. It is at least harmless so long as it does not make one blind to the fact that some women are competent and therefore such positions should be opened to them.

Cuba's Government

Recent news from Cuba is not wholly creditable to the insular Government. Money has been wasted upon office-seeking politicians, but

so little of it was appropriated for sanitation that Dr. Guiteras, widely known as an authority concerning yellow fever, has given up his place at the head of Havana's Health Department. For the expenses of the wanderings of Loynaz del Castillo, an active political general, in South America as a special envoy, with duties undefined, \$40,000 a year was readily granted, but Dr. Guiteras cannot get enough for defense against fever. When we read of the elaborate preparations for the drawings of the "national lottery," we regret that a part of Governor Magoon's legacy to the Cuban people could not have been the prevention of this nuisance. Some continuing restrictions were imposed by the Government of Intervention. Unfortunately they did not include prohibition of national lotteries. This country is directly interested, because a large sale of tickets in the States is predicted. If it be true that two Cabinet Ministers who have been displaced were implicated in an attempt to defraud the Government of \$254,000 in connection with the purchase of land for a military camp, it is to the credit of President Gomez that he annulled the transaction and got rid of them. He does not appear to have been fortunate in his selection of Cabinet officers. His Postmaster-General shot an editor last week and is a fugitive from justice.

Peace at Any Price

In his present state of hysterical paranoia over the threatened German invasion, no wonder that John Bull has officially repressed Bernard Shaw's latest play, "Press Cuttings." In times that try men's souls,

"Tis his nature that things
To be a funny man."

Hear the irrepressible shocker:

Isabelita—The Germans have killed three more Dreadnoughts.

Miriam—Then you must lay down twelve.

Balsquith—Oh, yes; it's easy to say that, but how do you do it?

Miriam—Think of what it would cost to be invaded by Germany and forced to pay an indemnity of five hundred millions.

Isabelita—You say that if you get compulsory service there would be an end of the danger of invasion.

Miriam—In this country, my dear fellow, it increases the danger tenfold, because it in-

creases German jealousy of our military supremacy.

Balsquith—After all, why should the Germans invade us?

Mitchener—Why shouldn't they? What else has their army to do? What else are they building a navy for?

Balsquith—Well, we never think of invading Germany.

Mitchener—Yes, we do. I have thought of nothing else for the last ten years. Say what you will, Balsquith, the Germans have never recognized, and until they get a stern lesson they never will recognize the plain fact that the interests of the British empire are paramount and that the command of the sea belongs by nature to England.

Balsquith—But if they won't recognize it what can I do?

Mitchener—Shoot them down.

Balsquith—I can't shoot them down.

Mitchener—Yes, you can. You don't realize it, but if you fire a rifle into a German he drops just as surely as a rabbit does.

Balsquith—But dash it all, man, a rabbit hasn't got a rifle and a German has. Suppose he shoots you down?

Mitchener—Excuse me, Balsquith, but that consideration is what we call cowardice in the army. A soldier always assumes he is going to shoot, not to be shot.

* * * * *

Balsquith—The absolute command of the sea is essential to the security of the principality of Monaco. But Monaco isn't going to get it.

Mitchener—And consequently Monaco enjoys no security. What a frightful thing! How do the inhabitants sleep with the possibility of invasion, of bombardment, continually present to their minds? Would you have our English slumbers broken in the same way? Are we also to live without security?

Balsquith (dogmatically)—Yes. There's no such thing as security in the world, and there never can be as long as men are mortal. England will be secure when England is dead, just as the streets of London will be safe when there's no longer a man in her streets to be run over or a vehicle to run over him. When you military chaps ask for security you are crying for the moon.

Mitchener (very seriously)—Let me tell you, Balsquith, that in these days of aeroplanes and Zeppelin airships the question of the moon is becoming one of the greatest importance. It will be reached at no very distant date. Can you, as an Englishman, tamely contemplate the possibility of having to live under a German moon? The British flag must be planted there at all hazards.

Sometimes, however, " 'Tis a very funny thing to be a serious man." Last week the Premier, Mr. Asquith, announced that four new "super-Dreadnoughts" will be built at once; "it is the only program consistent with the safety of the Empire." This is what might be called

the peace that passeth *all* understanding. Tho we lay ourselves open to the charge of being a mollycoddle, we desire to call England's attention to Mr. Bartholdt's bill, recently introduced into our Congress, appropriating \$100,000 for the appointment of two commissions, one to hasten the formation of the Hague Court of Arbitral Justice and the other to study the question of the limitation of armaments. If Congress passes this bill and Mr. Taft appoints the commissions as suggested by the recent Chicago and Mohonk peace conferences, there is little doubt that England would appoint a similar commission, and then the other nations would follow suit. Let Congress pass Mr. Bartholdt's bill. It will be of more advantage to humanity than raising the tariff on kid gloves and stockings.

War Against War This, the wacry of anti-militarism, is taken very literally in

Catalonia. The Catalans, in spite of the fact that they have been incorporated into the kingdom of Spain for eight hundred years, are still unreconciled and refuse to regard themselves as Spaniards. They form the richest and most industrious part of the population and realize that the burden of a foreign war would fall chiefly upon them. When Spain was involved in war with this country the Catalanian National Union met openly in Barcelona and resolved that no taxes be paid until the Madrid Government put an end to the war. Then, as now, the troops had to be employed in fighting the mob that ranged the streets of Barcelona for several days. But we do not have to go so far afield for a parallel. Our own commercial metropolis resisted a draft in an unpopular and expensive war, just as Barcelona does now. The mob in New York City hunted negroes in 1863 with the same fury as the Catalans hunted priests and nuns. The Colored Orphan Asylum in New York was sacked and burned with manifestations of delight, as was the Catholic Orphan Asylum in Barcelona. In both cities women and children joined with the men in torturing the prisoners of the mob. The combined fiendishness of cruelty and obscenity was

exercised on the victims, alive or dead, while thousands looked on, laughing and cheering. During the four days when New York was in the hands of the mob more than a thousand persons were killed and property to the value of a million and a half dollars was destroyed. Whether the mob in Barcelona was more destructive than this cannot be told from the meager dispatches. Such scenes as these force us to realize that there are worse evils than war. For patriotism is an ennobling passion even tho it is aroused by an unwarranted war, while riot, however justifiable, is degrading. More Spanish ammunition was expended at Barcelona than at Melilla. The Communists injured France more than the Germans. The second siege of Paris was worse than the first. War has been in the course of centuries so conventionalized that it can be pursued in an impersonal, almost an unimpassioned manner, but riot knows no laws and gives the latent savagery of human nature full vent.

A French Scandal At present the Affair Bassot fills a large space in the press of Paris. An ex-religious, Mlle. Le Fer de la Motte, opened and conducts a sort of home for young girls known as "La Maison Sociale." Unhappily for her, a M. and Mme. Bassot confided their daughter to this home. The young lady ran away by means of a convenient automobile. Then she brought suit against her parents for confining her. The suit was compromised. *Le Matin* secured her written account of her experiences and daily presents tidbits to its readers. The affair promises to become a serious scandal and will involve the ecclesiastical authorities. Dr. Peries, formerly Professor of Canon Law at the Catholic University, Washington, is already involved. His experiences with American newspaper men seem to have taught him nothing, for he got hopelessly entangled in a recent interview with a Parisian reporter, who appeared to have the whip hand of the doctor in canon law. This affair even involves the report that Archbishop Amette will have to resign the see of

Paris. He is a *persona non grata* to the present Curialists, who are about to take advantage of the fact that Mgr. Amette did not report to Rome the Affair Bassot. The girl's father went to Rome and brought the case to the notice of Cardinal Del Val, who would like to hang Amette's scalp to his cincture. That he can do anything by virtue of canon law is no doubt an error. The entire *Corpus Canonicum* is on the Archbishop's side. But "what is the Constitution between friends"—or foes?

Where is the poet of the aeroplane? The locomotive has proved to be intractable material for poetry, and M. Sully-Prudhomme seems to be the only poet who has ventured to handle the balloon, but the new flying machines, with their resemblance to birds and sailboats, give some promise of idealization. If it were not for that clattering motor! But M. Maeterlinck, in his dithyramb in honor of "Speed," has shown that the automobile may be made to go in poetical prose. "Darius Green and his flying machine" came to the ground with a jounce, but the Wrights have triumphed, and if literature can feel no thrill it is indeed dead.

King Edward has offered to make J. M. Barrie a Knight, but Barrie says "No sir." He ennobles himself by his refusal. A man who has touched the hearts and opened the eyes of the men, women and children of two continents needs no such title. It would be as inappropriate as it would have been in the case of that other Scotchman, True Thomas, of whose refusal Kipling tells:

"I bid thee go up to the Throne of God,
I bid thee harp thy secret soul in three;
I bid thee go down to the Halls of Hell
And ye would make a knight of me!"

Mr. Eliot's five-foot bookshelf seems to be too long and tedious a way to a liberal education for the American people. Some of our enterprising newspapers are condensing it at the rate of a volume to a page. This is more reasonable. Almost anybody would be willing to do five inches of reading to acquire a liberal education.

Insurance

The Insurable Value of a Life

THE Aetna Life Insurance Company, of Hartford, Conn., recently published some figures regarding the insurable value of a life that are worth far more than passing notice. The idea of insurance is to replace something lost, as when a building is destroyed by fire, it is the province of insurance to replace the loss sustained. Again, when an insured man dies, it is similarly the province of insurance to replace him in so far as money can. The question is, therefore, What is the insurable value of a life? Of course, a man may insure his life for five hundred thousand or even for a million dollars, and who shall say he is overinsured? But let us suppose that a certain man is earning \$1,000 per year. In case death overtakes him, what amount of insurance should he have carried in order to replace the money value of his life, based on his earning capacity? The Aetna sets forth that the man's expectancy of life can be determined from statistics, and the present value of an income of \$1,000 per year for the number of years thus represented will show, at least approximately, the money value of this man's life, otherwise the amount needed to purchase \$1,000 per year for the particular life expectancy. The accompanying table incorporates the expectation of life from age 20 to age 60 and the present value of \$1,000 to be received annually during that expectation. The sums named are somewhat in excess of the proper insurable value, since in life the man devotes at least a portion of his income to himself and to his own expenses. If the man we are considering was accustomed to the consumption of two-fifths of his income on himself as an average, the remaining three-fifths, or the amounts appearing in the final column, will closely represent the insurable value of this life to those dependent upon it.

Age.	Expectation (in even years).	Present value of \$1,000 per annum (4% interest) during expectation.	Insurable value to dependent ones.
20	42	\$20,186	\$12,112

✱

WE had supposed that an insurance policy was payable to the beneficiary named therein and to no one else, unless with the written consent of the beneficiary endorsed upon or attached to the policy. It would seem, however, that this feature of the policy contract has been assailed in Folk County, Ia. It appears that one Thomas F. Brinsmaid, who was drowned some months ago while bathing in the Pacific Ocean, had an accident policy, in which the name of his mother was written as the beneficiary. Following the death of Brinsmaid his will was found to contain a provision devising the face of the policy to a young lady in whom the dead man was interested. She has brought suit for the bequest. The issue will be most interesting.

Steel Common Dividend

THE steady rise of the market price of Steel Corporation common shares for some time past has been the subject of much discussion. Some predicted an increase of the dividend to the old rate of 4 per cent. It was generally held by conservative financiers, however, that such an increase would not be warranted. During the last few weeks, the very decided revival of activity in the iron and steel industry has modified the views of those who expected no addition to the 2 per cent. rate. On the 27th ult., the directors declared a quarterly dividend of $\frac{3}{4}$ of 1 per cent., thus increasing the annual rate from 2 to 3 per cent. Net earnings for the June quarter were \$29,341,491, an increase of \$6,000,000 over those of the March quarter and of \$9,000,000 over those of the corresponding quarter in 1908. The following figures show the earnings of this year's two quarters:

June quarter	\$29,340,491
March quarter	22,921,208
January	7,262,605
February	7,009,330
March	7,089,327
April	8,163,244
May	9,001,228
June	11,510,019

It will be noticed that the monthly increase since March has been large and steady. Unfilled orders on hand, June 30, were for 4,057,939 tons, a larger quantity than had been reported since December, 1907. An increase of the dividend rate to 3 per cent. is warranted now by the situation. It does not follow that the stock for investment is worth \$74½ a share, the new high record price to which it rose on the 31st.

Crops and Trade

REPORTS concerning the food crops continue to be highly favorable. A large yield of spring wheat is assured, and the greatest crop of corn ever harvested appears to be at hand. Trustworthy authorities say that the farmers of Minnesota and South Dakota will receive more

than \$300,000,000 for their wheat this year, or \$165,000,000 in excess of the proceeds of last year's crop. Railroad earnings are quite satisfactory. For the first three weeks of July they were only 3½ per cent. under those of July, 1907, three months before the panic. Failure liabilities for the month are less than in any other month since early in 1907. Lake traffic for the season thus far exceeds that of last season by 65 per cent. In the steel trade, additional increases of prices were announced last week—\$1 per ton for bars by the independent companies, and \$2 for wire products by the Steel Corporation. This addition of \$2 makes \$4 in all since May 1. The structural mills have more work than they can do. Owing to the tariff settlement at Washington, the higher dividend on Steel common shares, and the general situation, there was a revival of activity in the closing days of the week on the Stock Exchange, where large transactions were accompanied by higher prices.

....Grange Sard has resigned as vice-president and director of the National Commercial Bank, of Albany, and his son, Russell B. Sard, has been elected a director in his place.

....August disbursements by railroad and industrial corporations, according to the *Journal of Commerce*, will amount to \$77,643,684, an increase of \$4,552,565 over those of August, 1908.

....Reports published by the Department of Agriculture show the following advances in average prices at the farm from July 1, 1908, to July 1, 1909: Wheat, .923 to \$1.208; corn, .757 to .770; potatoes, .778 to .910; oats, .502 to .562; barley, .581 to .670.

....The thirty-fifth annual convention of the American Bankers' Association will be held in Chicago, beginning on September 13. Addresses will be made by Governor Deneen, Speaker Cannon, Comptroller Murray, James J. Hill, James B. Forgan, Dr. Kilgo, President of Trinity College, Durham, N. C., and others.

The Independent

VOL. LXVII NEW YORK, THURSDAY, AUGUST 12, 1909.

No. 3167

Survey of the World

Final Passage of the Tariff Bill The tariff conference report, which had already been passed in the House, was passed in the Senate on the 5th, and the bill was signed by the President at 5:05 p. m., about three hours later. The final vote was 47 to 31. Seven Republicans, as follows, were counted in the negative:

Iowa—Dolliver and Cummins; *Minnesota*—Clapp and Nelson; *Kansas*—Bristow; *Indiana*—Beveridge; *Wisconsin*—La Follette.

Mr. McEnery, Democrat, of Louisiana, was paired in favor of the bill. Fourteen Senators were paired, but no other Democrat stood with him. If all had been present and had voted, the two totals would have been 54 and 38.—Early in the week those Western Senators who had consented to the removal of the duty on hides only upon condition that the duties on shoes and other manufactures of leather should be reduced discovered that this reduction would be prevented by the peculiar wording of the conference committee's bill. They demanded a correction, and insisted upon it even after Mr. Taft had tried to convince them that the bill as it stood really met their wishes. It is understood that he afterward changed his opinion about this. As these men were talking of voting against the bill, there was danger that it would be defeated. They were appeased by a concurrent resolution of correction, prepared by the conference committee and passed without opposition immediately after the passage of the bill.—During the debate of the two days preceding the final vote, the most vigorous speeches were made by the Republican insurgents. Mr. Bristow analyzed the bill, asserting that the Dingley rates affecting 65 per cent. of the

imports had not been touched, that increases affected 21 per cent., and decreases only 14 per cent. He pointed out increases which, he alleged, would enlarge the profits of Trusts and similar combinations. The increases in the cotton goods schedule affected the cheap, plain unbleached and bleached cotton cloth. The bill, he declared, violated pledges which had been given. Mr. Clapp, in the course of his criticism, asserted that the net earnings tax provided for no real publicity concerning the affairs of corporations. Mr. Cummins gave credit to the President for doing what he could within a very narrow range, saying that doubtless he could have done more if he had begun at an earlier day. The Senator said he had held that with respect to commodities of which our manufacturers could supply the home demand, high duties were not harmful so long as competition was effective in the home market:

"I have seen, however, competition in the most important fields of production grow weaker and weaker, until it has been easy to perceive that with many things prices have not been fixed by the fundamental and essential law of commerce, but by the arbitrary will of the producer, and solely with reference to the utmost profit that the trade will bear. Under these conditions, it seemed to me that excessive duties would necessarily become a shield for avarice and greed, and that duties should be so adjusted as to prevent the domestic producer from raising his price above a fair level without exposing himself to foreign competition."

He would vote for no revision that did not make such an adjustment. Mr. Dolliver attacked the increases in the cotton goods schedule and defended his Republicanism. The bill was a swindle of the American people, and he would not be a party to it. On the Democratic side Mr. Bacon attempted to show that the Demo-

crats had voted consistently for revenue duties, and Mr. Bailey asserted that this was the last extreme protection measure that any party would ever dare to propose. Mr. Aldrich briefly defended the bill. He denied that it favored monopolies. American enterprise had made monopolies in protected products impossible. He opposed the net earnings tax and said he would not have consented to an increase of the tobacco tax if the President had not insisted upon free hides.—Mr. Beveridge, in a speech favoring the appointment of a tariff commission, pointed to the exclusion by the committee of provisions allowing experts employed by the President to inquire as to production costs here and abroad. But Mr. Aldrich had said, he added, that the bill did authorize the use of experts for that purpose. Whereupon Mr. Hale (of the committee) assured him that this was an error, and that the conference committee had intentionally provided that there should be no authority to employ experts except for the purpose of ascertaining whether there was such discrimination by foreign countries as would require the imposition of the maximum rates. The President so understood it, he added. It is reported, however, that the President is planning to have the experts inquire as to production costs in the cotton goods and woolen goods schedules, and may at a future session ask that these schedules be revised.—On the evening of the 5th the President issued the following statement:

"I have signed the Payne tariff bill because I believe it to be the result of a sincere effort on the part of the Republican party to make a downward revision and to comply with the promises of the platform as they have been generally understood and as I interpreted them in the campaign before election.

"The bill is not a perfect tariff bill or a complete compliance with the promises made, strictly interpreted, but a fulfilment free from criticism in respect to a subject matter involving many schedules and thousands of articles could not be expected. It suffices to say that except with regard to whiskey, liquors and wine, and in regard to silk and to some high classes of cottons—all of which may be treated as luxuries and more objection of a revenue tariff—there have been very few increases in rates. There have been a great number of real decreases in rates, and they constitute a sufficient amount to justify the statement that this bill is a substantial downward revision and a reduction of excessive rates.

"This is not a free trade bill. It was not intended to be. The Republican party did not promise to make a free trade bill. It promised to make the rates protective, but to reduce them when they exceeded the difference between the cost of production abroad and here, making allowance for the greater normal profit on native industries here. I believe that while this excess has not been reduced in a number of cases, in a great majority the rates are such as are necessary to protect American industries, but are low enough, in case of abnormal increase of demand and raising of prices, to permit the possibility of the importation of the foreign article and thus to prevent excessive prices.

"The power granted to the Executive under the maximum and minimum clause may be exercised to secure the removal of obstacles which have been interposed by foreign Governments in the way of undue and unfair discrimination against American merchandise and products.

"The Philippine tariff section I have struggled to secure for ten years last past, and it gratifies me exceedingly by my signature to give it the effect of law. I am sure it will greatly increase the trade between the two countries and it will do much to build up the Philippines in a healthful prosperity. The administrative clauses of the bill and the customs court are admirably adapted to secure a more uniform and a more speedy final construction of the meaning of the law.

"The authority to the President to use agents to assist him in the application of the maximum and minimum section of the statute and to enable officials to administer the law gives a wide latitude for the acquisition, under circumstances favorable to its truth, of information in respect to the price and cost of production of goods at home and abroad which will throw much light on the operation of the present tariff and be of primary importance as officially collected data upon which future Executive action and Executive recommendations may be based.

"The corporation tax is a just and equitable excise measure which, it is hoped, will produce a sufficient amount to prevent a deficit, and which incidentally will secure valuable statistics and information concerning the many corporations of the country and will constitute an important step toward that degree of publicity and regulation which the tendency in corporate enterprises in the last twenty years has shown to be necessary."

Governor Johnson's Address at Seattle Minnesota's day at the Alaska-Yukon-Pacific Exposition was the 3d inst., when a bust of James J. Hill was unveiled. Governor Johnson made an address. "It is time," said he, "that the West threw off the shackles of the Past."

"I would remove our sectional divisions and our sectional states, but Minnesota and Washington and the States between them, with these

to the south of us, should rise in their might and claim for themselves that fair share of influence in the halls of Congress and in the administration of national affairs to which they are entitled by every law of common sense, as well as of political economy. We, as an integral part of the American people, should cast our influence and our votes, not only to advance the material interests of our own particular section, but we should be broad enough and big enough to labor for the common good of our common country. We have in the States west of the Mississippi the undoubted balance of power, no matter under what name the national Administration at Washington exists. In the years that have passed our population and our material wealth have not enjoyed that representation to which they are entitled, and, furthermore, our leaders have been content to follow in no small measure the leadership of men who represent relatively small constituencies and smaller commonwealths."

The call of the West, he continued, was for patriotism and progress, for emancipation from every form of Old World and New World caste and privilege, from the tyranny of wealth and birth, and from the domination of the Trust and the political machine:

"Fifty years of national folly in the enactment of navigation laws and high protective tariffs have crippled American shipping, until over 90 per cent. of our Atlantic commerce is carried in foreign bottoms. Notwithstanding this half century of maritime shame, the United States flag floats today over a merchant marine of about 4,000,000 registered steam tonnage, which carries to the markets of the world nearly 200,000,000 tons of American products. But on what waters float the colors of this merchant marine, and what freight do these American ships carry? One half of this vessel tonnage is on the Great Lakes; while the Pacific Coast, the Great Lakes and the Mississippi combined boast nearly 70 per cent. of the total. And the freight which it carries consists of the great staple productions of the West on their way to Eastern and foreign markets—the products of that great army of Western yeomen who demand no fostering hand of government and ask only for that justice and freedom to which they are entitled by natural right under the guarantee of our Constitution and our flag."

Letters in commendation of Mr. Hill from Ambassador Takahira, Lord Strathcona, John D. Rockefeller, Cardinal Gibbons, Speaker Cannon and others were read.

Mr. Taft's Projected Tour

The President left Washington on the afternoon of the 6th for his summer home in Beverly, Mass., and he does not intend to return until the

middle of November. He will remain at Beverly until September 15, when he will begin a long journey of more than 13,000 miles, in the course of which he will visit all but eight or ten of the States and also the two Territories in the Southwest. An outline of this tour has been published. From Boston, Mr. Taft will go to Chicago, and thence to Madison, Minneapolis, St. Paul, Des Moines, Omaha, and Denver. In Colorado he will visit Colorado Springs, Pueblo, and Glenwood Springs. He expects to reach Salt Lake City on September 24, and to remain there two days. Thence he will go to Pocatello, Butte, Helena, Spokane and Seattle. After spending two days at the Exposition, he will go to Portland and San Francisco. Three days will be passed in the Yosemite Valley. Thence the President will proceed to Los Angeles, the Grand Cañon, Albuquerque, and El Paso, where he will meet President Diaz. He will be received in San Antonio, Corpus Christi, Houston and Dallas, and will remain four days on his brother's ranch near Corpus Christi. Going directly from Dallas to St. Louis, he will begin on October 25 a four days' trip down the Mississippi on a steamboat assigned to him by the Deep Waterways Association. On his way to New Orleans he will stop at Cairo, Hickman, Memphis, Helena and Vicksburg. After three days in New Orleans he will go to Jackson, Birmingham, Macon, Savannah, Charleston, Augusta, Wilmington, and Richmond, and he expects to arrive in Washington on the night of November 10. At nearly all of the places mentioned he will make public addresses. He has promised to attend the installation of the new president of Wesleyan University, at Middletown, Conn., on November 11, and he has engagements at Norfolk and Hampton, Va., for November 19 and 20. On the 21st he will be in the White House at work on his message.

End of the Strike in Hawaii

The strike of more than 6,000 Japanese plantation workmen in Hawaii, which began about two months ago, came to an end on the 5th, a discontinuance of it having been ordered by the Higher Wage Association. The planters had steadfastly refused to make

any concessions, and the authorities had vigorously prosecuted the strike leaders for conspiracy and acts of intimidation. Many had been indicted, and altho the jury disagreed at the first trial of men so accused, the attitude of the planters and territorial authorities convinced the strikers that they could gain nothing by keeping up the contest. They had gone on strike for an increase of wages. It is said that the prosecution of those arrested and of the indicted men not yet tried will be pressed by the authorities. On the 3d, L. Mori, a Japanese delegate to a convention of laborers, attempted to assassinate Sometara Sheba, editor of the Japanese paper Shimpō. Sheba had opposed the strike. He was stabbed in the neck, but the wound was not mortal. The Higher Wage Association, at a meeting hurriedly called, formally expressed its disapproval and regret. Judge Deboldt has received an anonymous letter, in which the writer promises to kill him if any of the indicted Japanese are prosecuted to conviction.—The Navy Department intends to keep a flotilla of submarine torpedo boats at Cavité, near Manila. Two are there now, two are on the way from this country, and four more will soon be added.

Countries South of Us

The vacancy caused by the resignation of President Rafael Reyes, of Colombia, was filled, last week, by the election of Gonzales Valencia. About one year of the presidential term remains. Valencia was elected Vice President when General Reyes was elected President. He resigned because he represented the party that opposed Reyes. It was said that the recent revolutionary uprising at Barranquilla was in his interest, but he denounced the movement and was loyal to the Government. It is predicted that the tripartite treaty, to which the United States, Colombia and Panama were parties, and which was favored by President Reyes, will now be rejected at Bogota. This treaty was designed to settle the controversy over the secession of Panama. General Reyes, now in Switzerland, urges the Colombian people to make a coalition Government. He gave the following statement to the press:

"My only reason for resigning a year before the expiration of my term was the condition in my health. I am worn out and tired in mind and body. I came to Europe for rest and also to join my daughter. I have worked fifteen hours a day for the last five years for my country, which I left in peace politically and financially sound. Political motives did not enter into my resignation. I learned yesterday that my friend, Gonzales Valencia, had been elected to succeed me. I cabled to him my congratulations and assurances of my support. I consider him the best man in Colombia for this post."

He intends to return a few months hence, but in case of revolution or war before the time set for his return he will go at once and support the present Government.—Early reports did not show the full extent of the effect of the recent earthquakes in Mexico. Acapulco was completely destroyed. Seventy-three shocks were felt there in two days. It was necessary to throw down with dynamite the few buildings which remained standing. In that part of Mexico the growing crops were ruined. There were great fissures in the earth, and the moisture was taken out of the soil. In Mexico City more than 2,000 buildings were damaged by the shocks, and several large steel frame structures are found to be badly out of plumb.

A Strike in Sweden

On August 4 a general strike was ordered and resulted in an almost complete cessation of industry thruout Sweden and great hardship to all classes. The trouble began in a disagreement about wages in the paper, woolen and cotton industries involving 13,000 men. A Government board of arbitration negotiated a compromise which was acceptable to the Employers' Association but rejected by the General Federation of Trade Unions. The employers then extended the lockout to 40,000 men in the same industries and announced their attention also locking out the men in the iron and other industries on August 2. The Federation therefore called for a general strike and 300,000 men responded. All traffic was tied up and Stockholm ran short of provisions in two days. There was no ice and milk was delivered only for children by the soldiers. Meat and bread went up to famine prices. The

strikers camped out on the beach by thousands and spent their time fishing. The sale of liquor of all kinds, even of methylated alcohol, was stopped by the authorities. The undertakers and grave diggers joined in the strike and paupers from the State poorhouses were set to do their work, the funerals being under military escort. The gas and electric light plants were guarded and run by the soldiers. In spite of the general chaos and animosity there was very little violence. Civic guards of workingmen and other classes assisted the police and military in the maintenance of order. King Gustav called the leaders of both parties before him but could not get them to agree or to accept Government arbitration. Two regiments of soldiers mutinied out of sympathy for the strikers. It was not intended at first to call out the printers and telegraph and telephone operators but within five days after the beginning of the strike they also were ordered to leave work and generally obeyed. No drays or other wagons were permitted in the streets, even if driven by their owners, unless the driver had a permit from the strikers. Large contributions in support of the strike are coming in from other Scandinavian countries. According to Swedish law it is a crime to incite State employees, such as railroad men, to strike, and a Stockholm journalist will be prosecuted on this charge.

Barcelona Quieted

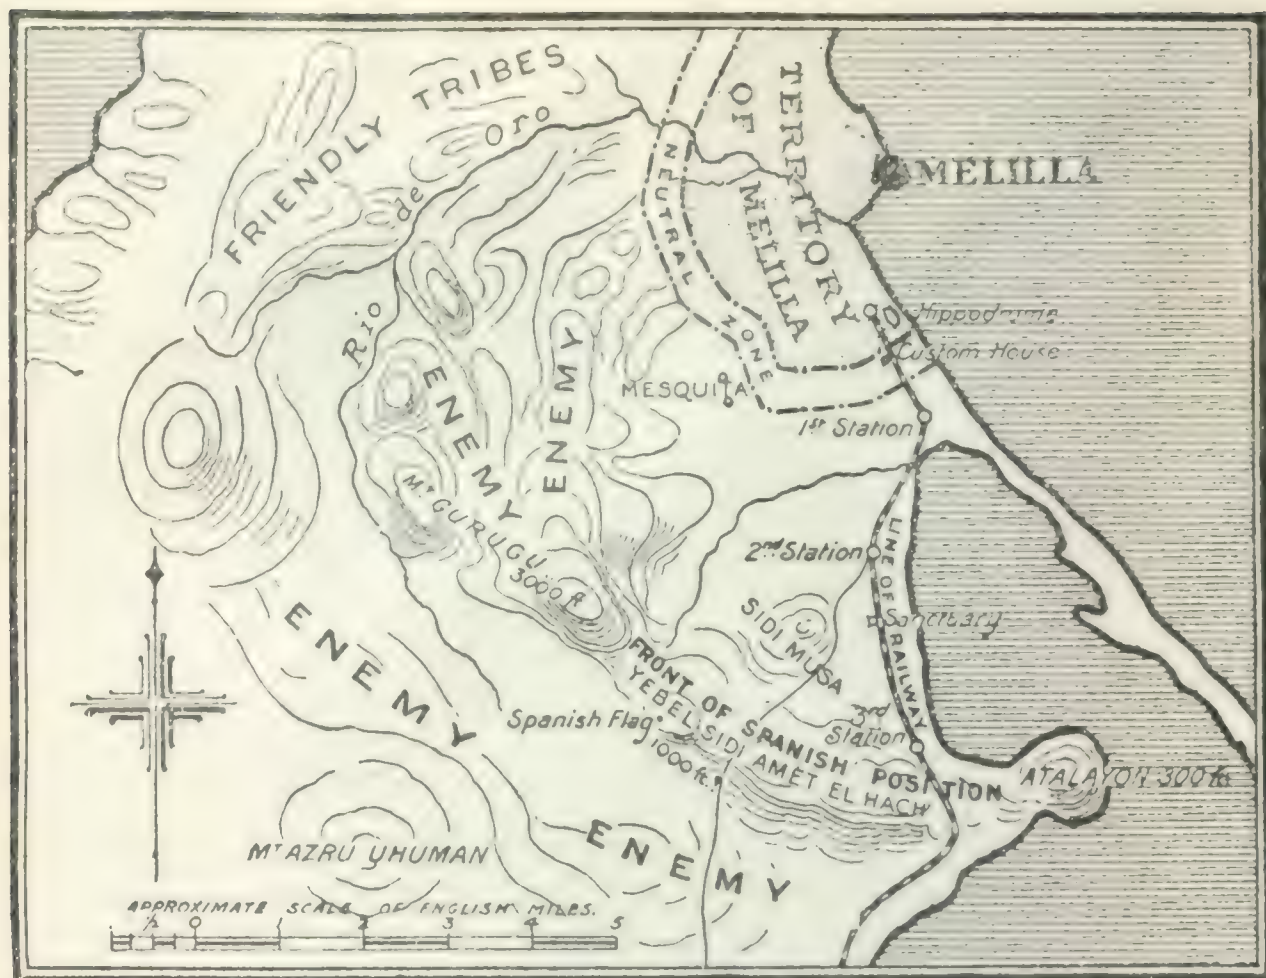

All the insurrectionary movements in Catalonia have been put down without difficulty by the troops and in Barcelona business and pleasure have resumed their normal course. Except for the ruins of the burned churches and the broken streets the city presents little evidence of the recent disorders. It is still impossible to form any definite conception of the character and extent of the rioting. The censorship is rigidly maintained and reports vary widely according to their sources. The estimates of the number of persons killed range from less than 100 to over 2,500. In contradiction to the reports of atrocious wholesale murders on the part of the revolutionists and the massacres of the people by the victorious troops we have the statement of Señor Solortega, Republican Senator,

who says that during the two days that the revolutionists were masters of the city they did not commit a single assassination or act of cruelty, and the announcement by the Government that there have been no executions. Five of the prisoners, however, have been condemned to life imprisonment in chains, and several hundred are still retained. A number of the captured revolutionists, including some of the leaders, have been released. In Sabadell, Mataro, Granollars and other towns, communes sprang up and a republic was declared. The people called together in the square in front of the town hall voted by acclamation for the prohibition of religion and the destruction of the churches. A list of thirty-five churches and convents which were burned has been published but this is probably incomplete. The libraries of the Christian schools and the Scientific Museum of Barcelona, containing altogether 70,000 volumes, were destroyed. The damage to bridges, railroads and stations by fire and dynamite is very great. Apparently a plot was made for a concerted strike in Madrid, Bilbao and other cities of Spain at the same time as the Barcelona outbreak, but the precautions taken by the Government or the disinclination of the people interfered with the plans. King Alfonso wished to go to Barcelona in order to exert his personal influence for the quieting of the people, but Premier Maura refused to permit him to risk his life in this way. Don Jaime, the successor of the late Don Carlos, as pretender to the Spanish throne, left Paris for Vienna and issued a proclamation declaring that he has no intention of taking advantage of the present disorders to advance his claims. The will of Don Carlos upholds the Salic law and reaffirms his rights as the head of the Bourbon family to the thrones of France and Spain.

The Defense of Melilla

Now that the insurrection in Barcelona is quelled, reinforcements are being dispatched to the relief of General Marina in Morocco. He has now about 35,000 men with modern artillery. A circle of blockhouses are being constructed around Melilla and along the railroad line leading to the mines for the purpose

From the London Times.

THE SPANISH POSITION ON THE RIFF COAST IN MOROCCO

of warding off the raids of the Moors. Each blockhouse will be garrisoned by sixty men. The Moors are attempting by night attacks to prevent the building of the blockhouses and occasionally they tear up a part of the railroad, but General Marina has succeeded in keeping the line open and in sending daily convoys of supplies to the outposts. The mines over which the trouble has arisen are about twelve miles south of Melilla down the coast and near Zeluan. About half way down the line on the seaward side is Mount Atalayon, held by the Spaniards, and opposite to the westward, the much higher Mount Gurugu, which is the stronghold of the Moors. From a captive balloon the Spaniards can see the ravines are filled with tribesmen, but are unable to drive them from their fastnesses. The last attempt resulted in a terrible disaster when the Spanish troops moving in solid masses thru a gorge were attacked from the hills on both sides and, unable to escape or retaliate, lost half their men and three-fourths of their of-

ficers. The medical and commissary branches of the service showed the same inefficiency and unpreparedness as the military, greatly increasing the loss of life among the wounded. The tribesmen of the vicinity being in part the descendants of the Moors expelled from Spain under Boabdil after the capture of Granada are hereditary enemies of the Spaniards and thirsty for revenge for ancient humiliations and recent wrongs. Melilla has been in possession of the Spaniards since 1496. It was until late of little importance, having scarcely a population of 3,000, many of these fugitives from justice, but in 1887 it became a free port and the center of commerce for the Riff coast, then the exploitation of the lead and iron mines to the south made it necessary to increase the garrison. The mines are worked by two Spanish companies, backed, it is said, by French and German money. They hold franchises of doubtful validity from the Moorish authorities of the vicinity, and the fact that prominent officials and

churchmen of Spain are largely interested in the companies has given rise to charges of financial and political corruption, which accounts for the antagonism the Spanish people show to engaging in war in their defense.

The Cretan Problem

The withdrawal of the troops of the four protecting Powers from Crete has, as was expected, caused a renewal of the agitation for the former annexation of the island to Greece. There has been so far no disorderly manifestations in Crete, but a considerable party in Greece are openly urging the annexation and the Turkish Government is firmly insistent that there shall be no change in the present status. In fact, the Porte has demanded, either verbally or in writing, a very explicit disavowal on the part of Greece of any intention to annex the island. Greece has so far failed to return a satisfactory reply, but has informed the Porte that the Greek officers in Crete have been stricken from the army list since 1906. Zealous patriots in Greece are, however, unofficially collecting money for the strengthening of the army in anticipation of a war in behalf of Crete, and on the other side a volunteer regiment has been formed in Macedonia, ready to begin a march toward Athens. There is no probability, however, that the affair will be allowed to lead to war. The four Powers, Great Britain, Russia, France and Italy, are working in harmony and will be prepared to exert their concerted influence on Turkey and Greece to prevent any outbreak.

The Antung-Mukden Railroad

Japan has notified the Powers that despairing of gaining the consent of China to the reconstruction of the Antung-Mukden Railroad, the work will be entered upon immediately regardless of Chinese opposition. Japan points out that the Peking Treaty of 1905 permits Japan to reconstruct the road so that it will be "fit for the conveyance of the commercial and industrial goods of all nations." China has, however, pursued her "well known policy of construction and procrastination" and has maintained "an unyielding

and unaccommodating attitude which gives no promise of anything but vain and unprofitable negotiations." Therefore the construction of the line according to the plans which the Japanese engineers have long ago prepared has been started. It is not known yet whether China will offer any resistance or not. The Regent, however, has expressed a wish to continue the negotiations. Before the war with Russia Japan built a railroad from Fusan, on the southern cape of the Korean peninsula, to Seoul, the capital. As soon as the war broke out this line was extended as rapidly as possible thru Korea from Seoul to Wiju on the Yalu River, and thence forward into Manchuria, as rapidly as the army advanced until it reached Mukden, the capital of Manchuria, where it connected with the railroads from Port Arthur to the southward. The line, however, was laid on the easiest levels and in the most inexpensive manner, and has a gage of only two feet, six inches. The Japanese have reconstructed the Korean Railroad since their occupation in that country, making it a standard gage, and have put a steel bridge across the Yalu River from Wiju to Antung which has become a Japanese city and controls the timber trade of the Yalu, the bone of contention of the Russo-Japanese War. The Japanese will now, if nothing prevents, transform the narrow gage line from Antung to Mukden to standard gage, and by the construction of tunnels and bridges shorten the distance between these points from 188 miles to 150. The interior of Manchuria will then be in direct connection with Japan, with an eight or ten hour sea passage across the Strait of Shimonoseki to Fusan. The reconstructed railroad will form practically an extension of the trans-Siberian line to Europe.—W. D. Straight, representing the American financiers who want a share in the Hankow-Sze-Chuen Railroad, is negotiating in London and Berlin with the syndicate which obtained the concession. It is understood that America demands the right to subscribe to one-quarter of the loan of \$27,500,000 and also to have an equal voice in the appointment of the engineers in charge of the construction in order to insure that one-quarter of the contracts for rolling stock and material be placed in the United States.

Thrilling Times in Westminster

BY JUSTIN McCARTHY

FEW tragic events occurring in our modern history have created so profound a sensation thruout Great Britain and Ireland as the murder of Sir Curzon Wyllie by the Indian assassin Dhingra. Indeed I may say that a like sensation has been felt thruout all the civilized countries of the world and most assuredly in the United States and Canada. I need not attempt to relate for my American readers the story of that tragedy, which must have become fully known in the United States almost as quickly as it was proclaimed thruout horrified London itself. The immediate consequences of the crime, however, have been the very opposite of those which the assassin himself must have yearned to bring about if we do him the poor credit of assuming him to have been a political assassin and not a murderer merely inspired by selfish hatred and a selfish passion for vengeance. A distinguished Indian professional man lost his life in endeavoring to come to the rescue of Sir Curzon Wyllie, and the father and the brother of the murderer himself have joined in expressing with horror-stricken emotion their utter condemnation of the crime.

Ever since the murder there have been continuous declarations from all Indian associations and conspicuous representatives of Indian opinion thruout the English dominions and in India itself—declarations of horror at the crime and utter repudiation of any manner of sympathy even with the supposed political opinions of the criminal. It was well known of course in England already that Sir Curzon Wyllie's career during his military and civil services as one of the representatives of England's dominions there had been conspicuous for its enlightened and benevolent treatment of the native populations who came under his rule and for his close attention to their wants and wishes and national claims.

I can recall to memory no similar sensation created in Westminster and thruout all London since the memorable day when the terrible story came of the mur-

der of Lord Frederick Cavendish in the Phoenix Park, Dublin. On that day, too, there was at first a feeling even among many Englishmen who ought to have known better that the motives of the crime must receive distinctively the sympathy and approval of a large proportion among the Irish National representatives who were then maintaining the cause of Home Rule in the House of Commons. I am never likely to forget the feelings which filled my then parliamentary leader, the late Charles Stewart Parnell, and myself when we heard the appalling news from Dublin, and thought among all its other horrors of the only too probable fact that it might impress many even among those British supporters of our cause in the House of Commons and outside it that the sympathy of the Irish Nationalist population in general would go with the perpetrators of the murders. So it seemed indeed only too probable in the first instance, but I need hardly now remind my readers on either side of the Atlantic that Parnell and his party were afterward proved to be, even before the tribunal created by constitutional authority for the purpose of a full and decisive inquiry, entirely free from any share in or sympathy with the plot which had been got up by the most ignoble enemies of the National cause. The world has already obtained the clearest evidence that the intellects and consciences and hearts of the native populations of India had never given the slightest support or encouragement to any conspiracy got up for the promotion of murderous crime. From every region of India and from among all the Indian residents in England have come the most unqualified denunciations of the recent crime.

I may add that it has come lately to my knowledge that Sir Curzon Wyllie and the beloved and noble-hearted wife who followed his remains to the grave have always been active promoters of the work undertaken by the organizations formed for the prevention of cruelty to animals.

THE LATE SIR CURZON WYLIE.

The death of the Marquis of Ripon will bring back the memory of the civilized world to the story of a political and personal career alike entirely deserving of honor. That career, however its close may be lamented at home and abroad, had not come to an end before accomplishing a lifetime of noble work. Lord Ripon had lived to a far advanced age—he was in fact already approaching towards the close of his eighty-second year when the illness came which brought his noble life to an end. Lord Ripon had in fact retired from public office towards the end of last year feeling that his physical powers were no longer equal to the task of rendering full justice to the daily work of the public office in which he engaged. He was emphatically a man who could not endure the thought of remaining at the head of a political department when he felt himself no longer able to attend fully and conscientiously to its duties. In 1874 he became a convert to the faith of the Catholic Church and the impressions of most observers at the time was that this

decision must change for him the whole course of his public career and close against him the doors of ministerial office from that time forth. It would indeed have little mattered to Lord Ripon if his conscientious decision had brought with it such exclusion. But there were statesmen in England who held more exalted and in the true sense more absolutely religious views than those, and among these statesmen was Mr. Gladstone, who appreciated all the more sincere religious devotion in others because his devotion to his own form of faith was absolutely sincere. Gladstone came back to office and power after Lord Ripon's adoption of the Catholic faith and in 1880 he as Prime Minister appointed Lord Ripon to be Governor General of India. The rule of the new Viceroy made itself one of the memorable chapters in the history of British government there and will always be held in honor by all who appreciate the true principles of Indian administration.

Lord Ripon was ever a philanthropist

THE LATE MARQUIS OF RIPON.

SIR SQUIRE BANCROFT

in the true sense of the word and he consistently and energetically lent his help on behalf of suffering animals as well as of suffering human beings. My Irish fellow-countrymen in the United States will hardly need to be reminded that he was a thoro supporter of Ireland's claim for the right of national self-government. I may say that I had the honor of an acquaintanceship with Lord Ripon during many years and thus had ample opportunity of appreciating his genial and charming qualities in private life as well as his eminent characteristics in the world of politics and statesmanship.

I need hardly say that events such as those I have been describing have for the time turned public attention away from the immediate study of the political and financial questions which had been absorbing the interest of the Lords and the Commons and the rate-payers generally. The House of Commons of course kept to its financial work with steadfastness, but in the outer world for some days little was heard of Mr. Lloyd-George and of the Conservative Opposition and the

Tariff Reformers, and whenever one came to join in a group of men or women conversing here or there he was sure to find that all were thinking just as he was himself thinking of Sir Curzon Wyllie's murder and of Lord Ripon's death. The assassin of Sir Curzon Wyllie has since proclaimed himself a political avenger, but even the nearest members of his own family do not, as we have already seen, credit him with anything but a deed of private and personal crime.

"The Bancrofts" is the title of a handsome volume just published by John Murray, of Albemarle street, London. The title page of the volume describes it as "Recollections of Sixty Years." I need hardly tell any of my American readers who take an interest in the life and movements of the drama that the authors and also the hero and heroine of this volume are Sir Squire Bancroft and his gifted wife, Marie Bancroft, known thru all her early career by her stage name of "Marie Wilton." In a preface to the volume, which bears the initials S. B., reminds those who need such reminder that "shortly after the close of our twenty years of management, in 1885, we devoted two volumes to an account of our careers both on and off the stage." The book, which I can remember well, had a great success and passed thru several editions. Since then, however, the author and authoress have been inspired with the very happy design of bringing out in a somewhat different and somewhat more condensed form the whole of their memories belonging to stage life and real life. "This," Sir Squire says, "is our apology for retelling in a different way, and with that greater freedom which is born of the lapse of time things which happened in the first half of that long period." The volume is richly and lavishly illustrated with admirable engravings taken from pictures or photographs of all the leading figures who are described in its pages, with pictorial reproductions of stage scenes from plays made successful by the Bancrofts, and with engraved copies of autograph letters from celebrated men and women of the time. I may say that the volume includes many portraits, letters and reminiscences of distinguished men and

women who never figured on the stage or wrote plays or even criticisms of plays, for the Bancrofts had close and intimate friends among celebrities in all manner of pursuits, and indeed had many close and valued friends among men and women who never were or attempted to be celebrities in any department of life. American readers will find in this volume descriptions and allusions to compatriots of theirs who have made themselves personally known in Europe and of some even who are known in Europe only by their genius and their fame.

In the field of fiction too we have lately had a very interesting production. This is "The House of Intrigue," the latest novel of Percy White, and published by Messrs. Hurst & Blackett of London. This story, and more especially in its character-drawing, shows us the author in some of his brightest and most characteristic moods. The author does not, so far as I know, claim to be or endeavor to be a great romancist, and his principal ambition seems to be to give us scenes and persons such as might be met with in the everyday life of our own time and to make them as real, as living, as varied, and, some of them at least, as intensely interesting as tho they belonged to the realms of the most fanciful and thrilling romance. Such is indeed Mr. White's special endowment. With the lightest touches of his pencil he enables you to see distinctly the living reality, the inner man or woman, of some human creature endowed with an individuality which makes itself felt all thru its own little world and yet has nothing in it of the melodramatic or the fantastic, of the stage villain or the stage hero or heroine. Such is to my mind the principal charm of this very clever story, and although Mr. White is a most rapid worker and has given to the public novel after novel without any long interval between the appearance of one story and its next successor, there is no sign whatever in this his latest book that he has worked his productive capacity too much.

My readers, I am sure, will be interested in the news which comes to me from a very authoritative source that a biographical volume on John Bright is

shortly to be published by Messrs. Smith & Elder, of London. The book is to be written by Mr. R. Barry O'Brien, the author of the very interesting, able, and accurate account of "Dublin Castle and the Irish People," of which I made a review not many weeks since in the pages of *THE INDEPENDENT*. The strange fact is that so far as I know there has as yet been no life of John Bright given to the public, although his was one of the noblest political careers in the England of our time and although he may, I think, be ranked as on the whole the greatest popular and parliamentary English orator of that period. He was, as I know full well, appreciated thoroly in the United States as a devoted opponent of slavery and therefore a supporter of the great national cause which President Lincoln advocated and represented. Mr. Barry O'Brien was a close observer of John Bright's public career and a sympathizer with his noble purposes and an admirer of his genius as an orator, and will, I trust, give us a work worthy of the occasion.

LONDON, ENGLAND.

LADY BANCROFT

'Twixt Hay and Grass: A Midsummer Medley

BY BRANDER MATTHEWS

"A MAN who knows little of Nature may write one excellent description, and a poor man may have one bright gem; real excellence consists in having many." So asserted Walter Bagehot, no countryman himself, but a "city man"—in the British special meaning of the word. The acute critic of men and of government was a townsman of the strictest sect, no rustic, but urban and urbane, keen to peer into the intricacies of the British constitution and of the Lombard street which is its firm foundation. Yet he was sagacious also and suggestive when he chose to unbend his mind over a book. How was it, then, that he himself did not leave us his one excellent description of Nature? Perhaps the explanation is to be found in the fact that to him, as to the Greeks of old and the Romans also, and even to the French of the classical period, Nature was far less interesting than human nature. Only in the past century is it and since Constable opened our eyes to a charm unsuspected before that we have ceased to prefer the landscape with figures to the lovelier view which expresses only the vague, uncrystallized emotion of the painter himself. What must Constable have thought of Watteau—who complained that Nature put him out?

It is a pity that Thoreau never went to Europe and never had occasion to record his opinion of the suave French artist who was at home only with the least rural of shepherds and shepherdesses in a landscape that was sophisticated out of all simplicity. Thoreau never saw a Watteau, probably, and had no opportunity to edge a phrase that would take away that painter's reputation. The Yankee artist in words had been nourished on the Greek poets; and he was able now and again to give to one of his sentences the unexpected ease, the winged felicity, the lapidary concision which so often delights us in the Anthology. He wanted Nature all to

himself, and he would have been put out sorely if he had caught sight of a beribboned and berouged shepherdess sauntering self-consciously thru the Walden woodland. He was so friendly and familiar with all outdoors that a townswoman of his once sharply protested that "Henry talks about Nature as if she had been born and brought up here in Concord!"

And, pray, why should he not? Where should Nature be born and brought up except in Concord? Where would she find herself more at home? Where could she associate with more friendly folks? Nature had just as good a right to be born in Concord as in the remote Bandusia, where gushed the spring that Horace loved. Why should not Nature have as many birthplaces as she needs? Was not Homer born in seven contending cities, more or less? And why should not Nature, whom he followed afar, have been born in seven hundred welcoming countries, if so be she had a mind to? Even if Nature cannot "get religion" why should not she be "born again"—over and over again—even unto seventy times seven?

Thoreau was a polished rustic who went to the woods for a purpose of his own, totally satisfied with his own birthplace and refusing to adventure himself abroad for what he could find at home readier to his hand. "It is not worth while to go round the world to count the cats in Zanzibar," so he insisted. His were fireside travels, journeys taken by the hearth, heaped with the wood that had warmed him twice, once with its cutting and again with its blazing. Truly rural as he was, he had a right to make Lowell's brag also and say "I am a bookman"—that Lowell who was to write his humanity with a tang in it of the bitter-sweet they both cherished. Tho he chose so to entitle them, Lowell's were less "fireside travels" than Thoreau's; and even his "garden acquaintance" was

less intimate, even if it was as sincere. But Lowell also gave his whole heart to the Elmwood where he was born; and his thoughts went longingly back to it even when he was happy enough in that distant London which he described as "seated in the hearing of a hundred streams" of thought and of intelligence. At one Fourth of July reception at the house of the American Minister a friend told him of a visit to the Cambridge home only a fortnight before; and the master of Elmwood asked wistfully: "Do the trees seem to miss me?"

Disraeli once declared that he had been "born in a library"; and yet bookish as he was he found rest and surcease in listening to the plash of the fountains of Beaconsfield. Bookish tho we may be and bred in a library tho we may have been, there is profit in our getting out of the town which is dramatic into the country which is lyric. Once in a while every bookman ought to subscribe to a fresh air fund for himself and to seize the first chance to escape from those pulsing cities of ours, where even the grass seems to be living on its nerves. Views afoot may be more significant than even the most instructive of foot-notes; and Nature publishes her poetry in a legible text. In the spring it is good to loaf and invite your soul, where she has spread her free lunch, by the brink of the Pierian spring which is always ready to "set them up again" without money and without price. And once more in the fall, it is good to go forth and to woo the virgin forest where every tree is an old maid, no matter how many rings she may have and where the delicately-minded maples blush red even before the other trees begin to bare their limbs—which may be accepted as an outward and visible sign of that modesty of Nature which Hamlet invoked.

It is hard enough for the craftsmen of the pen not to be vain of their gift of expression; and perhaps it is not a little difficult for them not to be puffed up by the belief that what they cannot express is not worth expressing and that what they do not know is not knowledge. But even the most conceited of us would find profit in taking a day off now and then to enumerate a few of the interstices of his omniscience. How many of us real-

ly can tell the wild flowers from the birds? How many of us are subcutaneously conscious of that suburbanity which is only Westchesterfieldian? How many of us have ever heard a catbird mew or have ever caught a catfish from a catboat?

It is something to break out of the city gates even if only for the briefest of outings. It is something to get away from the clock that lifts itself silently above the sidewalk to a greener space, where time is measured only by a sun-dial not made by hands. Of course we can claim no more than a bowing acquaintance with Nature, we can assert no long-standing friendship, if we do no more than exchange calls once a year, ignoring each other's existence the rest of the twelvemonth. But Nature is a cunning politician; she never forgets a face once familiar; and whenever we raise our hats in greeting she is ready to return the unexpected bow with the smile that won't come off. Nor need we pay our call in state, since there is no porter in her lodge to repel those who do not roll up in costly equipages. Nature is no distinguisher of persons; even if she does belong to an old family, she does not take a false pride in her social position; and it may be that she has often a warmer welcome for the casual pedestrian than for the complete motorist, offending the atmosphere with sound and smell.

Even that up-to-date vehicle, for which the out-of-date name was horseless carriage, will not carry you into Nature's domain more rapidly than you can go on your own legs. "I have learnt that the swiftest traveler is he that goes afoot," so Thoreau informs us; and it takes little money to make shank's mare go or to pay for its stabling over night. You can fare along in the best of good company with but a single comrade. Even if this boon companion has set himself astride of Pegasus, you can keep pace with him if only you are mounted on a hobby of your own; and then no five-barred gates can deny you entrance into fresh fields and pastures new.

Nor need the visitor to Nature's realm hesitate to travel by the broomstick train sparkling thru unexpected rurality or even to let himself be carried on his way by the iron horse with its fiery belly and

its breath of bellowing steam. There is not a little of Ruskin's characteristic arrogance in his churlish irascibility toward the railroad. How was it that he dared to forget Turner's perception of the innate poetry revealed in "Speed, Steam and Storm"? It is in this domineering egotism of his for one thing, that Ruskin, who prided himself on being a gentleman and a scholar, disclosed himself as the true son of the wine-peddler who drove about hawking his intoxicating wares. Thoreau is a native gentleman, with all the courtesy of the savage, which is quite as genuine as that of civilized man and often more elaborate; and the Yankee had no hostility toward the space-devouring engine. Perhaps, when he had secluded himself at Walden, on the edge of the pond, he did not disdain the friendly greeting of the locomotive, out of sight even if not out of sound. It may have supplied a human note not unwelcome to his solitude, reminding him not impertinently that he was not alone in the world.

Probably the pencil-maker of Concord would have appreciated, even if the phrase-maker of Brantwood might not, that now vanished glory of Manhattan, when the westering sun shot its rays athwart the filmy clouds that used to wreath the swift trains of the elevated railroad sweeping past the cross streets at the changing hour when the dusk was setting down on the busy city. At times it seems as tho one trouble with Ruskin was his inability to understand that there must be some paradoxes that are not true. Vociferous dissatisfaction with the present and a shrinking horror from the future may tempt a man to pull his boat against the stream of time, whereby he gets fatigued even if he does not get anywhere. "I would rather sit on a pumpkin and have it all to myself than be crowded on a velvet cushion," so Thoreau maintained; but he at least was above the childish hope that a fairy god-mother would happen in one of these fine days and touch the pumpkin with her wand and change it into a gilded coach, soft with a multiplicity of velvet cushions.

By train or by trolley, afoot or afloat, it matters little, so long as you fare forth with your eyes open, your heart friendly

and your mind free. Nor does the season of the year import much, for whatever the week, you will find the book of Nature open so that he who runs may read. The friendly woodpecker will telegraph his welcome with a moss code of his own; and the chipper little chipmunk will flash across the road and then sit up on the fence to take notice, before starting off on a new game of tag. The ears of the traveler will be filled by the monotonous combination of the bumblebee, and his eyes will be rejoiced by the sight of a casual goose erect on one foot, like the poet-bore from whom Horace could not escape, *stans pede in uno*. If he is in good luck the wanderer may chance to behold the crows holding one of their frequent political conventions, and he will perceive for himself the futility of the frequent assertion that these gatherings are only camp-meetings. Any one maintaining this contention, even for a moment, may be dismissed at once as a nature-fakir, hopelessly ignorant of animal psychology. Hawthorne was absolutely in the right when he declared that "a crow has no real pretensions to religion, in spite of his gravity of mien and black attire; he is certainly a thief, and probably an infidel." Indeed, the more advanced students of animal psychology are said to be unanimous in believing that very few crows have now any knowledge of the Great First Caws.

It is well enough to have a spot in mind toward which to fare as slowly as you choose; but this goal matters little or its attainment either. It is the going on which is worth while, and not the getting there with both feet. Nor need the choice of this terminus torment you. One place is as good as another, if you do not really care whether you reach it or not. You may wade up stream under willows persistently weeping for their lost youth. You may tramp along shore listening to the wild waves as they repeat their devout orisons, "Let us spray." You may climb the foot hills, past the broad fields of buckwheat whitening in the early August sun, and past the orchards of heavy-laden apple trees, twisted with rheumatism brought on them by their reckless exposure to the weather.

Perhaps this last is the most enchanting, for there is peace on the hilltops, as Goethe declared; and there is incessant transformation also. The mountains are not monotonous, as the ocean is, with its habit of saying ditto to itself. The everlasting hills change color while you wait, and custom cannot stale their infinite variety. It is true enough that up on the heights the weather is likely to be fickle, and perhaps no better than it should be. But, after all, what is a wetting once in a way? And after every storm the sky will look as tho it had been fresh washed—and the blueing left in. Even if the clerk of the weather is a little humorsome and even if he does not know his own mind for an hour at a time, the result of his indecision is often delightful. Sooner or later there will be a rift in the clouds as they get ready to turn their sleeves inside out, that they may display silver linings that are never out of fashion.

And if the rain keeps on falling, as if the walls of the celestial reservoirs had broken, carrying away all the dams in heaven above us, what of it? All that you need is a tight roof over your head and a wood fire under your toes—a wood fire, brought up by hand like a child that has lost its mother, demanding affectionate care and repaying you in the end with a grateful warmth. Then you may speedily find yourself under a cloud—of your own puffing, if you are ready to smoke the pipe of peace as you drowse, dreaming that you have buried the hatchet—in the heads of your enemies. You may find this warm welcome at an inn which provides entertainment for man and beast, whereby the hobby you have ridden need not be left out in the wet. You may seclude yourself at the hearth of a friend, so sympathetic that your talk has silent patches and lays no burden on either of you. Or better yet, you may have gained your own ideal home, but dimly glimpsed before. Is not every man's house his castle?—and never more his own than when it is a castle in the air.

Then, when you are thus gently imprisoned by the rain which drips steadily from the eaves and copiously refreshes the later flowers of the fall, there is a topic to which the talk turns, like the

needle to the pole. In default of Nature outdoors you can spy out the secret of human nature, cribbed, cabined and confined within village habitations. Wherever you may be, there is ever some new thing to hear and to tell about the Natives, those uncanny creatures who wake up in the early spring to feed on the Summer Boarder and to carry on their undying feud with the Cottager who is given into their hands as a prey. For the sunny months at least they have to live with the Cottager, and they manage also to live on him, with wild surmises as to his habits and with tolerant contempt for his ignorance. To them the Cottager is a "city feller," which is the rustic equivalent for the urban "hayseed." The feeling of the Native for the Cottager seems to be commingled of equal parts of pity, of envy and of "despisy" (as the darky called it). What other feeling could they have for erudite persons who may be familiar with the opinion of Pythagoras concerning wild fowl, but who don't know an oak from an acorn tree.

When the Summer Boarder and the Cottager foregather they have their revenge in their own way, swapping strange tales of the manners and customs of the Native and exchanging anecdotes about his characteristics, linguistic and pecuniary. It was a Native, with a daughter a teacher of the district school, who declared that the name of his house was "Edgewood," and who then volunteered to spell it—"E-d-g-w-u-d." It was a Native, again, who was driving a party past a hotel fresh with new paint, and who informed his hearers that the building was now twice as large as it had been, explaining that the landlord had "built on the bigness of the old house." It was a Native, once more, who had, in the glen at the edge of his place, a little waterfall which went dry in midsummer, so he had built a dam to impound the stream, so that it might be craftily released for the city folks at the modest fee of a quarter each. When one party came in September to gaze on the brook that ought to have gushed down the rocks of the ravine, and when there appeared only a tiny spurtle, even tho the gates were opened wide, he conquered his natural desire to get the best of them

and to make the most out of them. "Well," he said, "that ain't much of a waterfall this morning, is it? I don't think it fair to charge you all full price for that. What do you say to 19 cents apiece?"

It was a Native, also, who met the request of a strayed reveler in rurality to be put on the road back to the hotel with the counter question, "Do you want the highest way or the sightliest?" And when the whimsiness of this moved the inquirer to respond that he would prefer the sightliest, the Native smiled broadly and cheerfully returned, "Well, that is the highest!" And it was a Native, driving a stage coach in the New England mountains, who was mightily irritated by two of his passengers, because they kept stopping the vehicle that they might get down to pick an unusual flower or to chip a rock that seemed to have no right to be found just there. The third member of the party explained their strange conduct by telling the driver that the two restless enthusiasts were naturalists. And the next time the Native drove that way he described their annoying doings to his new load of passengers, ending with the remark that "their keeper called 'em naturals, and certainly they behaved as sich!"

But the Native is no longer what he was only a little while ago. The invading foreigner is ousting him from his lair, Portugee on the shore and Canuck a little further back. In certain parts of New England now the wanderer who wants to ask his way had better begin with the question, "Do you speak English?" Of course, this is unnecessary if the questionee is young enough to be at school, for then, whether a Dago or a Dutchman by descent, he will have attained an elementary knowledge of Anglo-Saxon speech. But Dago and Dutchman, Portugee and Canuck, are not the only foreign folk to be found afield. Now and again the solitary horseman will happen on a negro settlement, and more infrequently still on a little nest of the aborigines. Nor is it unprecedented that the redskin has intermarried with the black; and then the papoose-pickaninnies have high cheek

bones and no kinks in their wool. Still stranger sights are possible on occasion; and once, in the foothills of the Berkshires, when the twilight was making ready to let her curtain down and pin it with a star, there was a startling vision at the cross-roads. It was a Sioux Indian on a bicycle, herding home the cows. But this red man was no survival; he was an importation. He was a Carlisle Indian, who had hired himself out as a farmhand in the intermission between the football seasons.

The Native has not only been crowded out by intruding aliens of every tinge; he is suffering also from dry rot. For a century or more the ambitious young fellows have been going out to push their fortunes where opportunity was larger, leaving behind them the lazier and the less enterprising to bring forth after their kind. The best have been bred out, and the least worthy have been in-breeding only too closely, generation after generation. In many a nook and corner the Native is now the result of the survival of the unfittest. And when the nook and corner happens to have been captured by the Summer Boarder and the Cottager, the Native is exposed to the contagion of idle frivolity and of empty leisure. It is small wonder that he is likely to be demoralized and to find his frayed ethical standards falling to rags about him. Sometimes it drives him to an increased craftiness and sometimes it leads him down to an indurated shiftlessness. There was a Native once who was town treasurer, and he kept the accounts on his cuffs, and when they happened to go to the wash, his bondsman had to make good the results of his casual cleanliness.

But what need is there for the wayfarer to tarry with the Natives, the flotsam and jetsam of human nature. Soon or later the Clerk of the Weather will turn off the rain and turn on the sunshine again. And then all outdoors proffers itself once more; and he who has known the flower-de-luce only as it is virgin on the royal banneret of France or blushing on the urban shield of Florence, can go forth to find it for himself by the edge of the swamp.

NEW YORK CITY.

Some College Spelling

BY WILLIAM B. BAILEY, Ph.D.

ASSISTANT PROFESSOR OF POLITICAL ECONOMY AT YALE UNIVERSITY.

SOON after Easter of this year the members of my course in American Social Conditions in Yale College submitted their essays upon the relation of the local to the State government in the towns or cities in which they lived. There were nearly 250 students in the course, about two-fifths of whom were seniors and three-fifths juniors. The average length of the essays was a trifle less than 3,000 words. About a third of the essays were typewritten, while 171 were in the handwriting of the students. Those written by hand were the first to be read, and I was struck at the start by the number of misspelled words. Accordingly, to relieve the tedium of the reading, and to determine the frequency of these mistakes, a list was made of the words misspelled by the men whose essays were in their own handwriting.

As a result of this tabulation some interesting facts appear.

In 25 essays there was not a misspelled word. In 86 per cent. of the cases less than 10 words were incorrect, while in 14 per cent. 10 or more were misspelled. One man misspelled 22 and another 31 words. The average per student was almost exactly 5.

Since a number of men misspelled the same word several times in an essay, the total cases of misspelling were much more numerous than the total number of different words misspelled. Thus 17 per cent. of the men made less than 10 mistakes in spelling, while 29 per cent. made 10 or over. Two men made 45 mistakes each. The total number of cases of misspelling was 1,237 from 171 essays, or an average of a trifle over 7 per essay.

There were 443 different words incorrectly spelled in these papers. Of these, 315 were misspelled in but one essay. There were 10 words in which mistakes were made by over 10 men, and in 1 case there were 21 offenders and in another 29.

The number of times in which certain words were misspelled shows great variations. We find 289 words which were misspelled but once, while 21 were misspelled 10 or more times. One word was incorrect in 33 cases, two in 41, while one was misspelled 81 times.

In 385 cases the words were misspelled in only one way, but in 41 cases they were incorrectly spelled in two different ways; in 10 cases in three ways; in 5 cases, four ways; while one word offers a choice of five different methods, and another of six. The word *privilege* was a stumbling block to 17 men. Four men insisted on spelling it *privelege*, 3 men each preferred *privilige*, *priviledge* or *privelege*, while 4 men divided their choice equally between *privilidge* and *privilage*. We have authority for spelling comptroller as *comptrollar*, *controller* or *comproller*, while 1 man, confident that the letter *p* should appear, chose *contromplar*. Committee was misspelled by 6 men, who were divided between *committe*, *commitee*, *comittee* and *comitee*. To the men from New York City Bellevue Hospital became *Bellvue*, *Belvue*, *Belleview* and *Bellview*. To 10 men the chief State executive was a *govenor*, to 2 a *governor*, while to 1 each he was *govornor* or *govener*. Borough and incompetent were misspelled in four different ways each, while appellate and council offered three choices. Superintendent and separate were misspelled by 29 and 16 men respectively, but all made the same mistake.

It is of interest to determine the character of the mistakes which were most frequently made.

Mistake	Number of words misspelled	Example of mistake
Single for double consonant	66	commisison
Double for single consonant	26	controll
e for s	15	concent
s for c	12	conserning
a for e	33	independant
e for a	28	separate
e for i	20	detrimental
i for e	14	defined
a for i	11	charaty
i for a	10	comparative
o for e	8	coronor
e for o	6	corperation

Nearly 50 men made the mistake of placing an unnecessary *e* at the end of a syllable, as *département*, *développement*. A very common error was to transpose the vowels *ei* and *ie*. Relieve and receive were the words most sinned against. Preceding and succeeding offered difficulties to many, while offered and preferred proved troublesome. Why principal and principle should be so often incorrectly used by college students is a mystery. There are a few simple rules for spelling which should have prevented at least half of the mistakes. Before the age of fourteen these rules should be part of the educational outfit of the student in the grammar schools.

Another question which would naturally arise is whether the students who have proved themselves most efficient, when judged by the character of their work in the classroom, are the ones to make the fewest mistakes in spelling. In order to reach a conclusion upon this point, the 171 men were divided into three groups. In Group A fell 24 students whose work in the college courses had been decidedly good, due either to exceptional ability or industry. A large proportion of these were members of the honorary society of Phi Beta Kappa. In Group B came 78 men whose work entitled them to a position upon the appointment list. They were, perhaps, a trifle above the average. They represent the type which does pretty consistent classroom work without aspiring to high honors in scholarship. Group C, with 69 representatives, includes those who are not on the appointment list. Many of them are warned from time to time for unsatisfactory work, and some of them have been conditioned in one or more courses. The most that some can hope for is to be graduated with their class. They are the most undesirable students with whom an instructor is called upon to deal, for they rest contented with the minimum amount of work which will enable them to pass a course. The most undesirable of this class have fallen by the wayside before junior year has been reached, but every college class contains a number of these men, whose scholarly ambition is satisfied with the attainment of a college degree. Of course, no hard and fast line

can be drawn between these groups; and sometimes men who are prominent in literary work or other college activity are to be found in the lowest group, and some men have been handicapped by sickness or the necessity of earning all or a part of their college expenses.

The average number of cases of misspelling by a student in Group A was 4.2; in Group B, 7.2; and in Group C, 8.3. We find that in the lowest group the mistakes were almost twice as frequent as in the highest. But the average is liable to be misleading in this case, for the number of representatives in each group is so small that the presence of a very few of the extremely bad cases would unduly affect the average. To obviate this possibility of error, the following table was made. The men in each group were divided into five classes, according to the number of mistakes in spelling. Those who made no mistakes were kept separate, as were those who made 1-5, 6-10, 11-20, and 21 mistakes and over. To make comparison easier, percentages have been substituted for absolute numbers:

NUMBER OF CASES OF MISSPELLING.

Scholarship Group.	None	1-5	6-10	11-20	21 and over
A	29.1%	4.2%	16.7%	12.5%	37.5%
B	15.4	42.3	15.4	21.8	5.1
C	8.7	43.5	17.3	18.9	11.6

The percentage of those to make from 1 to 10 mistakes is nearly equal in the three classes, but here the similarity ends. The proportion of accurate spellers in group A is twice as great as in group B and over three times that in group C. On the other hand, there is not a representative of group A among those making over twenty mistakes, while over a tenth of group C come within this undesirable class, and over a twentieth of group B are to be found in the same column. The proportion of group A to make 11-20 mistakes is much smaller than of B or C.

This difference in the ability to spell correctly, which distinguishes the best from the poorest college students, is simply one manifestation of something far more fundamental. It is a difference in accuracy of detail. In other words, the exceptional student has a greater capacity for taking pains. His wits may not

be so sharp for the ready guess in the class room, he may not be so alert to make the most of an emergency, but he is the stuff of which scholars are made.

Doubtless many of the mistakes in spelling were due to carelessness and haste. Any one who is acquainted with the American college student will admit that one of his chief faults is procrastination. He will postpone work on any required subject until the last possible moment, when it is finished or half finished with a rush. There is no time for a leisurely reading of an essay to make sure that there are no trifling mistakes due to carelessness. The essays which form the basis of this study were due upon a particular day. Nine were handed in before they were due. Seven of these were written by men in group A, the remaining two in group B. Twenty-seven were from one to seven days late. Of these, twenty-one were from group C, five from group B, and one from group A. The average number of misspellings in the essays which were late was almost exactly fourteen.

In the course there were seventeen men who were either editors of some of the student publications, or had been prominent in the literary activities of the college. The essays of all but six of these men were typewritten and therefore could not enter into the comparison, but of the six remaining there was not a misspelled word in five of them, while the sixth furnished two mistakes. It is unwise to generalize from such meager data, but it is evident that if a student expects to become a leader in the literary activities of the college he must at any rate have learned to spell correctly. Cause and effect are here doubtless closely interrelated.

I was interested in reading the essays of the two Chinese students in the course, for I expected that they would be greatly troubled by the intricacies of the language, but not a mistake in spelling was to be found in either essay, and the handwriting was particularly clear. Similar praise could not be given to the penmanship of all of the essays submitted, al-

tho in most cases it was easily legible. One essay in particular was returned with regret, for it was the finest specimen of an illegible scrawl I ever encountered. Doubtless the mistakes in spelling were more numerous than these statistics imply, for the student was given the benefit of every doubtful case.

Poor spelling is evidently not confined to students of Yale College. Less than a week ago I received a letter from a graduate of a Western college, asking what steps were "necesary" to obtain the degree of M. A. at Yale. He also informed me that he held at present a "batcheler's" degree!

It is evident that something should be done to raise the standard of spelling among college students. But the college is not the place for such instruction. It should be part of the elementary education. So many additional studies have been crowded into the grammar schools that spelling no longer occupies the position of prominence which it held fifty years ago. The spelling bee was then possibly the chief intellectual test of the community. To be the best speller was a coveted honor. So many studies have been added to the curriculum that the time devoted to spelling must be curtailed. Perhaps we have gone too far. Certainly college students are deficient in this respect and the college authorities are trying to place the blame where it belongs by making one of the tests in English the ability to write grammatical English in words correctly spelled. Doubtless spelling is, to a considerable extent, a memory test, which some persons find it extremely difficult to master. Others can sympathize with Aldrich when he writes:

"My mind lets go a thousand things
Like dates of wars and names of kings."

But no one can blame the colleges of this country if they demand as one of the requirements of admission the ability on the part of the student correctly to spell words with which he would express his thoughts.

NEW HAVEN, CONN

The World's Greatest Shooting Preserve

BY ROBERT A. SUFFERN

[MR. SUFFERN has just returned from an extensive tour through British East Africa and has given THE INDEPENDENT the following interesting account of his experiences.—EDITOR.]

OUR Western States no longer offer a good hunting ground, and in most of the other parts of the world advancing civilization has spelled the doom of big game. However, there are still some places where vast herds of wild animals can be found, but even in these remote parts of the world their ranks are becoming thinned and the more valuable kinds of game are fast becoming exterminated.

There is one country which perhaps more than all others offers an inducement to the sportsman and tourist who is anxious to catch nature in one of her primitive moods, and to see man and beast in their original untamed condition. Roosevelt has heard the call of East Africa and many other sportsmen are also hastening to that field. I was fortunate enough to complete my trip before the approaching invasion of sportsman and tourist had grown great enough to overtax the ready hospitality and somewhat limited accommodations of the country.

Mombasa is the principal seaport of British East Africa, and from there a narrow gauge railroad penetrates the game country and brings Lake Victoria Nyanza within an easy two days' journey of the coast. Only seven years ago a large expedition with armed escort was necessary, and it took six weeks of hard travel to journey from the coast to the lake, but the railroad has not only remedied that, but it has sounded the death knell of slavery. No edict of the British Government could deliver as strong a blow at slavery in the heart of the continent as did the easy communication and effective control following the lines of the railroad.

But there are other changes which the sportsman and tourist will not like so well. The wild game is giving place to cattle and sheep, and the simple-hearted natives are losing some of their picturesque customs and are beginning to acquire a veneer of civilization. However,

to the passing tourist and to the sportsman who has only a limited amount of time at his disposal, the present offers a far greater inducement than was the case before the building of the railroad, when it was impossible to reach the game country in the interior without considerable danger and many difficulties, as well as great loss of time.

Mombasa is only a twenty days' trip from London, and the voyage can be made in comfort on board a good line of steamers. The town of Mombasa was discovered by the Portuguese about the time of the discovery of America. Many evidences of the Portuguese occupation may be observed, and the student of the humanities will marvel at the cruelties of the Portuguese and wonder whether it was altogether an improvement on the Arab civilization it displaced. Mombasa island is a beautiful spot. Groves of the evergreen mango tree, the strange twisted baobab, and the bright colors of the tropical flowers make a tremendous change from the bare sand wastes of the Somali Coast and the borders of the Red Sea. About the time I arrived in Mombasa, three natives were hung for murdering a European. The rain had not been as abundant as usual before the time of the murder and as the natives were suffering on account of the drought they consulted their medicine man or witch doctor. He recommended as a sacrifice a European's heart, hence the murder.

Neither the tourist nor the sportsman will care to stay very long in Mombasa and brave its damp heat and somewhat depressing climate. If the sportsman should want to try some hunting near the coast, he could find buffalo not many miles outside of Mombasa. These animals are generally to be found in difficult country, and some of the coast strip with high tangled grass and thorny bush offers a good haunt for them. When buffalo were more plenty and before they had learned to dread the white hunters,

they were very numerous upon the grassy plains, but they seem to have become more wary and retiring of late years. It is very dangerous to hunt buffalo where there is high matted grass and impenetrable bush, since in such country you cannot see your quarry until you are almost on top of it, and then should you chance to wound but not kill, the hunted buffalo may decide to bag the hunter.

It is not well to stay in the tropical jungle on the coast very long on account of the fever, so the hunter will shortly return to Mombasa en route to the highlands.

From Mombasa, three trains a week start for the lake. Near the coast the railway line passes thru a large plantation of banana, palm and mango owned by one of the old Arab Sheiks whose family controlled the country before the advent of the white man.

About 100 miles up the line lies the station of Voi. It is one of the first places that would interest the sportsman and the tourist. The shooting toward

the German border is fair and some lions can be obtained in this country. Around Voi are some plantations of rubber and fibre, and just over the German boundary eighty miles away the snow-covered peaks of Mt. Kilimanjaro reach an altitude of over 19,000 feet above the sea level.

Further up the line we pass into the Athi plains and enter the game preserve made by the Government along this part of the railroad. Within a strip ten miles wide extending along one side of the railway for several hundred miles, no game is permitted to be shot, and the animals not being molested have become quite tame. Herds of zebra oftentimes of fifty to one hundred head can be seen from the car windows, and the rumble of the approaching train does not seem to affect their contented grazing. Hundreds of antelope, such as Hartbeest, Thomsonii and Grantii, can be seen, and sometimes an occasional giraffe, a wildebeest or a rhinoceros. A flock of ostriches may try to scuttle over the track in the blind, idiotic way that our domestic

THE UGANDA RAILROAD AT KIKUYU ESCARPMENT.

barnyard hen always shows in trying to get out of danger.

The abundance of the game in these plains would make a ranchman wonder if it would not be equally good for sheep and cows, and the mind of the capitalist would turn to the possibilities of investment. On later observation it would be found, however, that the water supply was far inadequate for ranching purposes. For hours we ride thru these wide plains and rolling prairie lands with half-parched grass and no trees in sight save an occasional stunted thorn bush. These plains used to offer great hardships to travelers in the old days when they had to push across them in forced marches, suffering from lack of water and supplies.

About 225 miles above Mombasa is the station of Simba, whose name it might be interesting to note. This place was formerly quite famous for lions, and that they have not all been shot off can be proved by the fact that two of my friends shooting near here in the last part of 1908 reported seeing tracks of four lions around the body of an eland they had killed and left over night. Naturally it had all been eaten by morning and the vultures and jackals were found picking over the bones. Simba was rendered quite famous by the baboo (Indian station master) who in 1905 sent a telegram to the railroad headquarters in Nairobi, stating that lions had treed one of the assistants, who had taken refuge on top of the water tank. The incident was recorded in the Nairobi local newspaper at the time, since the baboo, hedged in by red tape which he feared to break, had asked for instruction. Evidently the baboo was not much of a sportsman, since on another occasion when the lions were in control of the situation he wired for some loaded cartridges, adding, with childlike candor, that he had blanks "but that you could not shoot lions with blank cartridges." The construction of the railroad was much disturbed by the activity of the lions, and many of the interesting stories of that time are now widely known. The lions did not cease their raids upon the completion of the line, but on one occasion a lion jumped through the door of a train and made off with a passenger. However, the rail-

road authorities all agree in stating that it was only a second class passenger and that if one rides first class no danger will occur.

Midway up the line from Mombasa is the town of Nairobi. It is in about the center of the country and it is the seat of the government and of the railroad administration. This is the point from which most of the sportsmen start their safaris. The word "Safari" is the Swahili for expedition or outfit for a journey, and the word is really a little more comprehensive than any word we have in English. It is to be presumed that the sportsman coming to East Africa has already made his safari arrangements, as quite an extensive caravan has to accompany each party of sportsmen. In addition licenses have to be procured from the Government granting the necessary permission to hunt. There are several good firms in Nairobi making a specialty of safari business and advance arrangements can be made with them either by correspondence or thru their local agents at London or New York. A good caravan will contain about 100 men, including native headmen, gun-bearers, porters and several hunters. The size of the caravan depends, of course, upon the character of the country to be visited, the length of stay, and the number of Europeans in the party. It is interesting to see a large safari starting out. The men walk in single file and the column may extend a quarter of a mile in length. At regular intervals all down the column some men will drum upon boxes or tom-toms, and the men will chant in a dull, monotonous way, sometimes for hours together. It is said that they often chant the praises or demerits of the huntsman, and on one occasion when a European came into town with heads and skins he pretended to have shot, his men gave him away by telling the story in a chant.

After the Government put up railroad and Government buildings at Nairobi the town quickly grew around it in true Western fashion, and in some ways today Nairobi bears a likeness to some of the frontier towns in our own Western States. Seven years ago lions were hunting where the streets of Nairobi now stand. Today there is a mixture of

AN ELAND ANTELOPE.

cheap buildings made of corrugated iron and tin and fine stone houses, lighted with electric lights. The business town and settlers' residences stand at the foot of a hill and the Government houses on its summit, and this difference only emphasizes the lack of unity that is shown in some ways between the two bodies.

Not many weeks ago a herd of about fifty zebras became frightened by some prowling lion, and stampeding they dashed thru the streets of the town. Five of the zebras became entangled in the barb-wire fence near the club house and were killed by the natives, who are very fond of zebra meat. Some months previous to this a herd of buffalo stampeded into the town of Nairobi.

The hunter leaving Nairobi will be guided as to the part of the country he visits according to the particular game he wishes to hunt. As to these matters the safari agent at Nairobi will give the aid of his advice and directions. If the hunter wants lions and general game and is willing to hunt in a dry and waterless country, he might continue up the rail-

road line to Kijabe and from there take a course towards the German border. During the last few months two Englishmen who were shooting in this district secured ten lions and four rhinos as well as a fair general bag. At one time there were a great many buffalo in East Africa, but in 1890 the rinderpest killed most of them off and the plains at that time were said to be littered with their bones. Since then the buffalo have begun to get more numerous, tho they will probably never be as plenty as they were in the days previous to the time of the disease.

The "latest" sport in East Africa is what they call "galloping lions." Of late several hunters have departed from the old custom of shooting lions and tried the more exciting method of chasing them upon the plains. As soon as they sighted a lion on the treeless plains they would gallop their Abyssinian ponies after it and probably would succeed in running down the lion until it turned at bay. They would then shoot it before the lion succeeded in getting

IN THE ELEPHANT'S FOOT.

near enough to them to do any damage. This sport is very exciting and requires good nerve on the part of the huntsman.

In approaching Kijabe station the railroad reaches an elevation of 8,000 feet, and from the top of the escarpment a wonderful view is afforded of the great Rift Valley, lying some 2,000 feet below. Fine forest trees line the top of the escarpment and cloak the precipitous descent to the valley at its foot. Above the railroad depot at Kijabe lies the station of the African Inland Mission, an American institution. The mission buildings are perched 7,500 feet high upon a well-wooded hillside and from the verandas of the director's house a magnificent view can be obtained of the whole country side. The baboons from the tropical forest occasionally raid the garden and carry off a good part of its produce. Not far back of the mission station there is a large bamboo forest that is well worth visiting.

Around Kijabe most of the natives belong to the Kikuyu tribe. They are easily distinguished by their ear decorations as well as by the fact that they are

not as finely formed as the Msai, who also are to be found all thru this section. The Kikuyus enlarge holes punched in the lobes of their ears until they get them large enough to hold a tobacco jar or a jam pot. They are a good-natured race and although at one time they gave the British much trouble, they are now most peaceable. An amusing incident was related by a traveler some years ago. He had a timid Kikuyu boy quite unused to European ways who showed a great anxiety to please his master. Upon finding a dirty cup on the table, the master reproved the boy, who appeared much frightened and distressed. The boy

A UGANDA BELLE.

seized the dirty cup and spitting vigorously upon it, he then polished it off bright and shiny and returned it to his master, who had been watching meanwhile with a horrified expression on his face.

The Rift Valley to be seen from Kijabe shows evidence of its volcanic origin. On one side is an old extinct volcano with a tangled piece of woods growing in its crater. Further down the valley is a strange death hole or vent in the earth thru which very poisonous gases escape. These gases are so dan-

gerous that no man or beast can venture into the place, which has become famous in native folk lore and legend.

A few hours above Kijabe lies Lake Naivasha, said to be the most beautiful lake in Africa. In this lake many hippo can be found by anyone canoeing along its reedy shores in early morning. At this time the many birds will be saluting the morning with wild cries, and circling about in search of the fabled early worm, frog or fish.

There are thousands of coot and duck, also pelican, geese, cormorants, cranes, and many other kinds of water birds. Near some parts of the shore great patches of blue water lilies can be found. These lilies, barring the difference in color and the fact that the blue African lily has a delicious perfume, are just like our white pond lilies.

On the hills to the north above the lake are some Msai villages, and great herds of goat and cattle are kept by this pastoral people. In fact, now that the British Government keeps them from warring on the other tribes and checks their hunting proclivities, they have but

little else to do beyond multiplying their herds. The Msai when fully dressed wear a skin or blanket over one shoulder and carry a large spear. They are tall, finely formed people, with impressive bearing. They have small, well-shaped hands and feet, and well-modeled features proclaim them aristocrats among the African peoples.

The lake is about 6,500 feet high and the climate is dry and stimulating. The temperature thruout the year is quite even and the place is on the whole decidedly healthful. In fact, from both beauty of location and excellence of climate the place would make an ideal health resort. The magnificence of the sunset as seen from the eastern hilltops on the lake side is almost unparalleled and it makes one marvel to see the Msai in the villages near by going about dull and unimpressed by the beauty around them.

The next important place above Naivasha is Nakuru, the present seat of the government of the Naivasha province. The town lies about two miles away from a lake about fifteen miles long. Thousands of water fowl congregate around the shore of the lake. When startled from their feeding great flocks of beautiful flamingo will rise into the air and perform their graceful evolutions over the traveler's head. The sun shining thru their pink and white coloring adds the crowning touch to the beauty of the scene. Lake Henington, by the way, has a great many more flamingo, but it is much more inaccessible. Soon the traveler from a temperate zone will feel the heat of the sun's rays and begin to realize that he is within one or two degrees of the equator. The high altitude makes the temperature quite cool and delightful, but at noonday the sun is burning in its intensity. At the end of the dry season the grass is parched and brown, and in parts of the surrounding country not a patch of green can be seen or a tree or shrub to give shelter from the sun.

There are some creeks leading into the lake and near the shores are papyrus and swamp lands where the hippopotamus finds shelter. There is but little use in shooting hippos in such places, as when shot they promptly sink from sight and

THE COURT JESTER OF THE KING OF
HUYORO, UGANDA.

there is almost no chance of being able to secure the wounded animals.

Some two or three years ago game was very abundant around the lake, and friends at Nakuru have told me of zebra breaking down their fences and lions coming near their houses.

Several miles north of Nakuru is the Mennigai crater, about three or four miles across. The volcano is now extinct, but that it still keeps up some sort of communication with interior fires is shown by the living jets of steam that may be found at one side. Within the crater is a wild tangled growth that shelters numerous game and beasts of prey. Here elephants are said to go to breed their young. The interior of the crater can only be traversed by following along the beaten elephant tracks or some other path made by wild animals. Along the mountain are deep gullies which afford a shelter to packs of wild dogs. These dogs are fierce and savage and an encounter with a lot of them would be an unpleasant experience.

Above Nakuru on the railroad is the small town of Njoro, where Lord Delamere has a large place. He has succeeded in combating sheep diseases so that he has at last been successful in raising a very good half breed Southdown mutton. There are several very good farms around Njoro. The land here is over 7,000 feet high and is good for both wheat growing as well as for cattle and sheep. In this high land the climate is delightful and the place is very healthy. There are many sections of East Africa, as in the district around Njoro, where the land offers great possibilities of wealth.

A little north of this strip of treeless plateau the railroad ascends the Mau Escarpment and passes thru a beautiful stretch of forest. Great trees reach fifty or seventy-five feet in height before a single branch occurs. This forest is, of course, better somewhat off the line of the railroad. At very narrowly it has been thinned out along the line. Beneath the trees a dense growth of shrubs and flowering plants makes the forest almost impenetrable unless it is cleared out by cutting or the small trees become broken by the passage of herds of elephant or other large game. Even from the railroad one

can obtain a good idea of its denseness by looking down some dark glade when the sun does not penetrate the leaty roof of the overhanging trees.

Buffalo are not found in the dense forest, but are more likely to be secured in the patches of burnt or cleared ground that occur in the forest at intervals. Oftentimes this cleared stretch will be only an acre or two in extent and somewhat marshy. The land will be covered with high buffalo grass and affords an excellent place for buffalo. This section is one of the most beautiful parts of East Africa and a great deal has been written about it by many enthusiastic sportsmen and travelers.

In this forest land lions were very numerous one or two years ago. In these stretches there is some good shooting and there are still some herds of elephant here, although the full grown males have mostly been shot off. One of the dreams of the pot hunter has been to find the elephants' "graveyard." Many good hunters declare that a sick or wounded elephant always tries to drag himself away to die in some secret spot. Several eminent hunters have declared that the elephant with his extraordinary intelligence would, when he felt death-pains stealing upon him, take himself off to some spot where others of his tribe and kindred had also gone to meet their fate. Should such a thing as this be true the graveyard would be a rich one and the numerous tusks of ivory well worth the finding. Possibly in the recesses of some extinct crater or the bottom of some African bog the answer to this riddle may be found.

The days of the elephants are already numbered, as the ivory hunter is fast exterminating them for the sake of the small amount of ivory they carry. Thousands of these most noble beasts are constantly yielding their lives to supply us with billiard balls and piano keys. Already the once numerous herds of British East Africa are thinned and scattered. Uganda has been for the last few years a great source of supply, but lately the herds of Uganda have greatly diminished. Now the hunters are turning their attention to the Eastern Congo, and immense kills have been made there of late.

Of late years several sportsmen have taken their wives with them on their hunting trips. In the East African protectorate the hardship is not too great for a woman, and if shooting is done in healthy districts there should be no danger on the score of health. One lady who had just made a trip from Nakuru told me that they had been in the woods when a herd of elephant, cows and young calves but no large bulls, had passed them. The wind was blowing away so that the elephants did not catch their scent and the herd of forty or fifty animals passed quite close. The danger is great during such times, for if the elephants had smelled the party they would have demolished it, as it is almost impossible to turn aside these powerful beasts when they have once made up their minds to charge.

The sleeping sickness, malaria and many forms of tropical diseases will help to protect the elephant in the districts around Lake Victoria and Lake Albert from the inroads of the sportsman, but the regular ivory hunter does not fear these diseases sufficiently to be deterred from seeking his quarry on that account.

It is whispered in Central Africa that when the Mahdi fled at the dispersal of his forces before Khartoum, that immense quantities of ivory were carried by his fleeing followers. It is thought that this ivory was buried on the shores of Lake Albert Nyanza, and some traders when they see a discolored tusk arriving on the coast wonder if the hiding place has been found and who has been the lucky discoverer.

The great herds of elephant that were in East Africa only ten or fifteen years ago have now become sadly thinned out and most of the animals now left in the accessible portions are but a remnant composed of cows and calves. This is due not so much to the sportsman as to the ivory hunter, who, until stopped by the Government, killed without hindrance every elephant that came across his path. However, there are still many bull elephants in certain localities far off the beaten lines of travel and the sportsman who visits the proper places can still look forward to shooting his elephant.

When a herd of quietly feeding elephants becomes alarmed, the old males

will form a circle around the cows and calves and pushing them in a close body they stand outside facing the danger, thus showing an almost human intelligence and chivalry. After seeing a sight like this, one becomes sorry to shoot a beast that is so noble.

In Uganda the Government has brought a tame elephant over from India in the hopes of using it in taming African elephants. There is but a little chance, however, that they will succeed in so doing, as the African elephant is very wild and difficult to reduce to captivity. Even should they succeed in taming the elephant there is but little likelihood that the tame African elephants would be a success commercially, as even in India the age of steam has limited the value of the elephant and the range of their activities so that no longer do they occupy an important economic position.

There is always much talk among hunters about which kind of shooting is the most dangerous. Some consider the lion the most terrible, while many others think the rhinoceros and elephant are more dangerous antagonists. The lion, if a man eater, will stalk his human quarry or attack the hunter upon sight, but unless it is a man eater a lion would not be likely to attack a man during the day time, unless he was wounded or finally forced to bay. The rhinoceros, however, will attack men upon getting sight or scent of them or upon becoming alarmed by the snapping of a twig. Occasionally a rhinoceros seems to run amuck and an infuriated beast will charge against a caravan that comes across his path, overturning everything in his way. They seem at such times to try and do as much damage as possible from simple malevolence, and the hunter will always exercise every precaution when he sights a rhino. Elephants are occasionally very dangerous and a wounded buffalo is sometimes a deadly enemy to contend with.

The rhinoceros are apt to be found in treeless plains, so that stalking them is rather difficult. The animals when in a bunch of high grass are not easily discerned and a hunter may often come almost on top of them before he sees them. The presence of the rhino is very often

given away by the rhinoceros bird. The thick hide of the rhinoceros is full of parasites, and the rhinoceros bird will perch upon the back of the rhino while feasting upon the well stocked larder he carries on his back. If some of these birds are flying above the back of a quiet rhinoceros the birds may be seen long before the animal himself becomes visible.

The element of chance plays a very important part in East African hunting, as according to the season the game wanders about from one place to another. Sometimes the matter of water and the state of the grass seem to dictate the choice of a new locality, at other times there seems to be no reason apparent for the desertion and migration to some new spot. Formerly Lake Baringo was one of the finest shooting grounds, but of late it seems somewhat overshot. Mr. Geoffrey Archer, the British Commissioner stationed there, stated that on one evening in the year 1906 he had seen 300 eland, 100 oryx, 32 giraffes and 3 rhino, besides the ordinary smaller game.

Within a few minutes after an animal

is shot vultures begin hovering around, and if the body is left exposed the birds and beasts of prey make short work of it. The vulture is not left to do its work unaided. Very often the lion drives away all smaller scavengers and helps himself to the carcass, or in case the lion is not about the hyena and jackal are always ready for a feast of decaying flesh. Sometimes the marabou will drive the vultures away and try to keep the carcass free from all smaller birds. The marabou is a sort of degenerate form of stork that has forsaken the good habits and vegetable diet of his cousin in Holland.

After passing over a level of somewhat over 8,000 feet the railroad gradually descends to Kisumu (or Port Florence) on the shores of the Victoria Nyanza Lake. One of the most interesting parts of a trip in Africa is the study of native life, and nowhere else within three weeks of London can a more unusual sight be found than in the native market of Kisumu. There stark naked savages without even a bead to protect them from

A DEAD RHINOCEROS.

the early morning chill may be seen squatting around beneath the shade of a tree or walking about all unabashed and undisturbed.

Port Florence is the terminus of the Uganda Railroad, which road, although it is styled the Uganda Railroad, does not actually penetrate Uganda since the terminus at Port Florence is some distance from the beginning of that protectorate. At one time the Kavirondo Province was embraced under the administration of Uganda, but for some time this has been included in the East African Protectorate. Kisumu or Port Florence is the largest city in Kavirondo Province. There are a small number of Europeans here connected with the Government and the administration of the railroad. There are also a few European traders stationed here and Port Florence is the headquarters of the small fleet of steamers that ply on the Victoria Nyanza. There is always a great deal of sickness here among the Europeans. The sun and climate cause fits of depression and loss of memory. Black-water fever and other malarial diseases are common.

The Kavirondo Province is quite rich, although it is so unhealthy that no Europeans could ever expect to settle there permanently. The natives are industrious and in that way contrast very favorably with the other East African tribes. In every village or small collection of huts the Kavirondo women can be seen tilling the soil or cultivating patches of "mealies." Mealies or Indian corn are the principal food of the natives in many sections and the natives can be quite often observed eating a handful of parched corn without waiting for it to be ground and cooked. In many parts of East Africa the women do most of the work as far as tilling the soil and working around the huts is concerned, and in some places the women carry loads. In one section where I had to descend a mountain I was unable to get any men for porters. The men there disdained to carry heavy loads, saying that they were women's loads. Two young women carried my heavy safari bag and small leather trunk upon their backs. The heavy weight fell mostly upon the backs of their necks since their load was held to their back by heavy straps passing

across their foreheads. The Kavirondo women are all good workers. Among this tribe even the men are industrious. The natives are a large well formed race and most of the men are at least six feet in height.

While parts of Kavirondo are fairly well populated, there is no doubt but that the land would support many times the number it now has. It is only a very little while since this Province has been opened up, and some of the young officers now in East Africa tell interesting stories of their early experiences in this section.

A few months ago an American missionary told me of holding services in this Province. The natives were very much interested in the services, as the singing and the address by a white man in their own tongue were of course very new to them and they took the same interest in the services that a street gamin would in a vaudeville entertainment. The missionary related to me that the natives would come hundreds strong in a procession led by chiefs, and to the accompaniment of the beat of tom-toms, they arrived before the building, leaping and dancing as they went along.

The Eden-like simplicity of the people causes the traveler to moralize over conditions and to wonder whether the natives would be better off if they were clothed. As it is they have a much higher standard of morals than most of the African tribes who go more fully clothed. At present the stalwart blacks seem like animated ebony statues, and coverings would seem as out of place as if statues were draped in hunting. This recalls to our mind that Darwin described some naked savages of the Amazon who felt it immodest to eat while people were looking upon them. The naked Kavirondo are reported to be of high morality and many of the other African races possess some of the best moral attributes. It is not uncommon to find a boy who shows his white master a wonderful fidelity and doglike devotion, and no offer of higher wages will cause him to leave a master whom he likes. Some of the Mohammedan Swahilis are so earnest in their religion that they will not even drink water from a glass that has the odor of whisky.

The effect of the hot sun causes a man to become either a philosopher or a pessimist; sometimes the natives seem to be both. They stand suffering in stolid silence—is it because they are philosophers, tinctured with Arab fatalism or because they are pessimists who see a world too big for them to understand? Even men of great minds might become lost in wonder at the immensity of all nature's works in Africa, where every-

thing is measured on a new and vast scale. Africa has strange vagaries and there is a combination of wonderful natural beauty with loathsome disease and savage cruelty. Still Africa always claims those who come within her borders and long after the unpleasant things are forgotten one recalls the fragrance of the blue pond lilies and the glint of the sun on the flamingoes' wings.

—H. P. G.

Ethics of a Big Store

BY HANFORD CRAWFORD

[Mr. Crawford is general manager of the department store of *Marshall Field & Barney*, in St. Louis, Mo., an establishment founded fifty-eight years ago, and bearing first rank in the department stores of St. Louis. He is a member of the Retail Merchants' Association. His article is part of an address given by him before the National Methodist Federation for Social Service, at its last meeting.]

It is generally considered that it requires some skill to be a barber, and certainly a high degree of skill to be a first-class cook. But when you sit at the head of a department store day after day, in a large city, you get such an amount of advice and suggestions that it would seem to be the general impression that almost any person can do this better than the one who is really doing it. A manager of a department store may perhaps be permitted once in a way to "talk back."

A department store is a reversion to type—the type of the old, country, general store, of which here and there a few specimens are still to be found. A young man in Alabama whom I know has such an old-fashioned general store, in a town of 1,200 people, 500 of them colored. I helped him to buy his goods last fall. He carries a \$15,000 stock, and he bought carpets and millinery, plows and chains, shoes and a well-sweep, ribbons, stationery, jewelry, harness, and I do not know what else. Much of his trade is barter, but to the best of his ability he is working it as a department store.

The general store was succeeded first by the special store, and then it swung back again to what every city resident is now familiar with—the department store; the largest example of which is in Chi-

cago and carries the name of Marshall Field. In the department store the effort is made to gather together as many different lines of goods as can be profitably and conveniently handled under one roof and with one organization, so that the customer can save the time required to go from one store to another. This large organization must be able to buy for the lowest cash prices, and therefore to deliver goods to the customer at a price somewhat less than the various departments could do if they were disconnected stores. It strives to do for its customers better than they can do for themselves.

The question is often asked as to the intellectual and commercial development of the employees, compared with what it would have been had they remained in the smaller store. One does not have the two side by side and cannot compare them with absolute accuracy, but I believe that it will be found that the man at the head of a department or occupying any position of responsibility in a department store will earn more money than the same man will be likely ever to earn in the individual store. As to skill in his work, the department store man has the best of it also. When any one of us in the eight or ten large stores in St. Louis is looking for an employee to place at the head of a department, we are rare-

ly able to find that person in one of the very small stores. The man there is seldom as competent to take up the duties of the head of a department as the person is who has been trained in the broader and larger commercial field of the department store.

The department store compared with the small store has shortened hours of labor, increased the number of holidays, and practically guaranteed an annual vacation with pay to the majority of its employees. Furthermore, the real financial worry and the strain of policy is carried by the employer, and this leaves the individual employee far more time for himself and for his own improvement than he ever would have had in the care of a small store.

In a department store you have many of the conditions of a city. It is a world in itself, in its discipline, its machinery, its relations. It is beset by all the difficulties that go to make up a world. The store of Marshall Field & Co., in Chicago, has ordinarily at least 5,000 employees under its control, and in the busiest season approximately 7,500. There go thru any such store in any ten hours on a fairly busy day enough people to carry on from 10,000 to 50,000 records, transactions of one kind and another, involving the assistance of one or more of the various clerks. There is hardly a social problem that does not show itself in some form in the department store—the question of the union, the question of child labor, of woman labor, of the relation of men and women, the relation of employer and employee, and, most distressing of all, the relation of the individual customer to the clerk and the employer.

This last relation brings the entire community into contact with the store, and while it does not exist in the factory or in the wholesale business, it is the last ultimate proposition in all trade. When a manufacturer makes goods and sends them to the jobber, they are not yet sold; when the jobber repacks them and ships to the retailer, or to the sub-manufacturer, they are not sold, even tho they may have been twice paid for. They are not sold until they are handed over the counter by the retailer to the consumer, to eat, to wear, or to use in whatever way he will.

Our customers, after years of patronage, come to feel that in a certain sense they own the store and for this reason they have certain vested rights or privileges. We get our ideas of what is needed from our customers; we try to please them. We try to do the business as they would have it done, in so far as this is morally right and meets the general wishes of society. The very perplexing question of the individual consumer is in no business so involved as it is in that of the department store, whose success hangs not upon the management of any one department, but upon the uniformly profitable and successful management of all its departments.

The great problem in the department store is the contest between the profit account and the expense account. The cost prices for large quantities of merchandise have been standardized. No one store has any particular consideration as to the purchase price of goods; the ease of communication and the large amount of advertising make it impossible for any one of us to have any serious advantage over the others in the selling price. The women can go from one store to another, effectually preventing one store from being materially higher priced on the same goods than another.

The struggle over the expense account brings up the whole question of salaries—the amount that can be paid to employees directly, the amount that can be spent by us in caring for them, the compensation possible for length of service and as special incentives to increased effort, and how we are to care for them in the way of promotion. In these matters some of the most delicate questions of morals arise, involving both the employer and the customer in the treatment of the employee.

Do the employees receive for their services a fair amount of the total profit that comes to the store? It should be remembered that these large stores grow up and some large fortunes are acquired, which all people hear of, but mention is seldom made of the many large fortunes that are lost. It still remains true that 99 per cent. of the men who go into business fail of success, and that only a small percentage ever achieve great success. In some of the depart-

ment stores in St. Louis, for the last two years, at least two-thirds of the total profits received from the stores has been paid out in salaries to employees. One third is all that has been allowed to pay rent and all other running expenses, interest on capital and allied obligations. This large wage scale has been maintained simply that faithful clerks might not be thrown into the street, left without employment, and thus add still further complications to the unfortunate business conditions of the times.

Apart from the regular salaries of employees, different stores have different methods of providing additional compensation. In some cases this is based upon the increase of business done in one season over another, or upon a reduction in the running expenses of a department, or upon superior skill in buying. This principle of giving additional compensation, when possible, prevails in all department store business. Besides this, in possibly 60 per cent. of the department stores in the United States, it is as easy for an employee to buy an interest—small, perhaps, but quite likely up to the limit of his means—as it is to buy a share in a railroad. Our department store system offers increased pay for increased efficiency, and additional compensation by some form of the "bonus" system, or by the opportunity to become interested in the stock as a member of the company. It is, therefore, perfectly possible for employees to rise year by year.

As to employing boys or girls at work who are under the legal age, we find it very easy to follow the rule. The only possible difficulty is that parents and guardian will insist frequently on

swearing falsely to the age of their children. Also, in order to keep the law, we often seriously offend customers who are interested in families of poor people, and wish us not only to furnish the money with which to help them in their philanthropy, but to break the law in doing it. The moment deceit is discovered in this matter there is never the slightest discussion or hesitation in any of the large houses as to remedying the error. We all believe the law is beneficial, not only to the children and to their parents, but to our service as well.

It is frequently stated that women working in department stores are beset with peculiar temptations and difficulties. I believe that some such difficulties do exist, and there may be isolated instances where little or nothing is done by those in authority in the stores to protect them or to guide them. But I do not believe that in the entire United States there is any considerable number of such instances, compared with the vast majority of department store proprietors who endeavor to bring about the best conditions, if for no other reason than for the mere question of policy. The Christian women, however, who go in and out of stores as customers, can do much to help in this matter. The fact that they are women makes it possible for them to hear things from women employees which the employer might never hear, and which are extremely detrimental to social order or to the moral life of the individual. Customers also, by showing greater consideration in their dealings with the clerks, can make the labors of these employees lighter, their hours shorter, and their chances for censure less.

—S. J. DODD, AM.

When Love Is Great

BY JOHN WARD STIMSON

When Love is great it does not cry:
"Give me the lip! Give me the breast!"
But rather: "Let me live and rest
Within thy soul toward heaven bent."

When Love is great, it does not ask:
"What doth the world around me say?"
It only seeks the perfect way
By which it may perfect love's task.

When Love is great it does not seek
In guile or gold or braided hair
The heart it holds, to lure or snare;
But wins it by its worship meek.

When Love is great, it doth not bend
To low device of "law" or "priest"
But, in the Spirit of the Christ,
Its acts and its assertions blend.
—NEW YORK CITY.

Should the Married Woman Teach?

BY A MARRIED TEACHER

THE two dominant reasons why the woman who marries should desire to retain her position as teacher are necessity and a genuine love for the work. Both reasons are legitimate and make for quality.

The first reason, necessity, naturally gives rise to the question, "Why does the woman marry if the man cannot make a salary sufficient to keep her out of the schoolroom?" The people who ask this question are the same people who continually decry the lack of family life and the declining domesticity of woman. Ignorance of an economic situation or adamant minds alone may cause it. To them there is no connection between an income barely sufficient to support one and this apparent degeneracy. How can the man of today marry in the fullness of his youth and vigor if his salary be small? How can he in a city at least support a wife, educate his children and lay aside a sum sufficient to keep him and his wife out of the poorhouse on a salary of \$1,200 a year? If the man does not marry until his salary is sufficient for two or more, the population of the country must naturally suffer, as it is a well-known biological fact that the most productive years in the lives of both men and women are those between twenty and forty.

Teachers are the poorest paid of all professional workers. In the lower grades of some of the public schools of this country the salaries are \$300 a year, altho the average may be considered about \$700. The average for the college professor probably would not exceed \$2,000. Many of the tutors and assistants in the larger colleges receive only \$500 or \$600. It is demanded of such professional workers that they be well clothed and well housed, cultured, traveled. With the cost of living increasing at the rate of twelve per cent. in three years, the man teacher must either remain unmarried or marry a woman who can add to his income in actual money. If, as a noted sociologist claims, like-mindedness be the true basis of society,

this also means that it is the true basis of friendship and marriage, and the union of the man and woman teacher would be the ideal one. There would be a community of interests with its natural consequences, intellectual and physical development. There is every reason to believe that from propinquity at least such marriages would be frequent and early if the way were made possible.

As a profession, there is none for the woman in general or the married woman in particular that lends itself better to her physical and mental possibilities than the profession of teaching. The instinct of motherhood, developed or undeveloped, that every woman is incomplete without, gives her a better understanding of children. She has more patience than men with the peculiarities of the earlier years of childhood. The short school hours, the numerous holidays and the long vacations make it the ideal profession for her.

In the work-a-day world in general, and teaching in particular, marriage seems to be a sieve which separates the chaff from the grain. The indolent, the physically weak and the inefficient fall thru the network and are lost in the world's great maelstrom, while the energetic, the proficient and the physically strong are retained to give their best because it is needed. The women who work after marriage work because *they want to work*. It is again the survival of the fittest.

Section 67 of the by-laws of the Board of Education of New York City reads as follows:

"No married woman shall be appointed to any teaching or supervising position in the day public schools unless her husband is incapacitated from physical or mental disease to earn a livelihood, or has continuously abandoned her for not less than three years prior to the date of appointment, provided proof satisfactory to the Board of Superintendents is furnished to establish such physical and mental disability or abandonment."

This law now merely applies to those seeking new appointments. The Board has been compelled to allow, after strongly contested legal battles, the efficient

woman to remain in her position after her marriage.

The rules of the Board of Education of Philadelphia forbid the employment of married women unless they can testify before a magistrate that they have not been supported by their husbands for at least two years previous to the date of application. Chicago, with characteristic Western breadth, says that marriage shall be no bar to teaching in her public schools, but stipulates, either through a paternal desire to protect the child or because it wishes to keep down the population, that the teacher must not have a child under two years of age.

While the State Board of Education of Massachusetts has no law or rule regarding married women teaching, the regulations of the Boston School Committee provide that "the marriage of a woman teacher shall be her resignation." In a few cases women with invalid husbands, or those who have been deserted by their husbands, have been appointed with the agreement that their resignation shall take effect on the recovery of their husbands or the return thereof. The committee defends these laws on the ground "that it is contrary to the best public morals to employ married women whose husbands are contributing to their support."

The effects of such laws are bad on the educational system, because they cut out efficient, experienced, normal, healthy-minded women from teaching in public schools. They are bad for the children because they are withheld from the influence of such women and are often compelled to remain in the hands of young and inexperienced teachers. If the married man be considered the better citizen, the better business man, the better employee, why should not the same be true of the woman? Does marriage develop one and not the other? Marriage, by fixing her position in life, gives the woman a stability that she can obtain in no other way. She is generally far less emotional than the single woman. Her heart is anchored fast in a safe harbor, while her single sister is often storm-tossed on the great ocean of uncertainty. This uncertainty has a tremendous effect on the temperament. If it affects her work the child suffers. If

the teacher is cross or lacks patience the child begins by disliking her and ends by hating teachers in general, the school and everything that pertains to it. This is the greatest mental calamity that can befall the normal child.

A law that prohibits a woman from teaching after her marriage cheapens the profession and places it for women below the level of an unskilled trade. A woman today may study to be a lawyer, doctor, architect, actress, anything she will, she may marry when she pleases, and still continue her profession for the good and pleasure of society. No one prohibits her, public opinion does not even utter a feeble cry. Her private life belongs to herself and her husband; in it the world has no concern. But with teaching it is different. A girl may spend years of her life in preparatory study, have the same interest in and love for her work as the women in other professions, and yet she has not liberty of action. If she conforms with the dictates of her natural being, she is cut off by the laws of a large number of States in this great, free country, this land of opportunity, from active participation in a profession for which she has fitted herself. Where is the justice of such laws?

They are bad for the home because they either stifle, crush or make it impossible, where the man's income is insufficient for the support of two and a possible more. The woman professionally trained is not often able to perform the drudgery of a servantless household. She realizes this and hesitates to give up a congenial profession and turn to housework, of which she knows little or nothing. There has been no time for it in her training. Why is domesticity expected of every woman and not of every man? No one expects the man to build his house, raise vegetables, kill cattle or make the garments he wears. He earns the money in his specialty and pays others to do these things. Cannot the woman do the same, or must she be doomed to be the only universalist in an economic world of concentration and specialties?

Where the woman teacher is debarred by law from being a real helpmate to the man she wants to marry, she either gives him up or falls into a long engagement,

the end of which sees them no better than the beginning. This practice is most heartily condemned by Prof. Simon N. Patton, of the University of Pennsylvania, who says:

"It is more sensible for a man who is earning \$25 a week and a woman who is earning \$18, making a total of \$43, to marry. They could get along jointly very well, and be happy on such a sum. Is that not better than for the young woman who has made \$18 and spent it all to try to make the \$25 a week do for two?"

The question arises would not the home of the woman suffer thru her outside activities; in other words, can a woman teach and still keep house? If it is necessary for her to maintain a home, if being a good housekeeper does not include the drudgery of the household, the cooking, baking, scrubbing, washing, but rather superintending those mentally and physically fitted for the task, the teacher, with her executive ability, is surely a good home-keeper. The modern house and apartment do not present insurmountable obstacles. Many unmarried business and professional women are keeping house, and yet no one hears that it interferes with their earning capacity.

These marriage prohibitory laws are bad for society because they encourage a celibate sect as rigid in its method as the Roman Catholic priesthood and sisterhood. Teachers are stigmatized as "old maids." Recently, at the class day exercises of a college given over to the training of teachers, the wit of the class wrote on a placard, "Know ye, sisters, that all who enter this profession are condemned to spinsterhood." If we consider matrimony a wise and good institution of society, education as an agent in civilization should do all in its power to encourage it. The public decries the lack of marriages among its elect, its college men and women, and yet what does it do to promote marriage among them?

The laws are defended by the various boards of education on the grounds of modesty. Such objections are neither logical nor in accordance with the modern pedagogic and scientific theories; they are not only prudish, but border on absolute immorality.

In the best schools the simple biological facts of life, animal and plant if not

human, are being taught from the kindergarten up thru the grades into the secondary schools and colleges. There should be no mysteries about motherhood. Canon Lyttleton, at the International Congress of Women held in England in 1899, thus advised the early teaching of the mysteries of birth and generation:

"We have to face the fact that in spite of all the efforts that are being made, there is an immense waste of life caused, not by the growth of sensuality, but solely by the ignorance of the principles of life with which children have to face the world."

The question of the child-bearing period in the life of the married professional woman, while important, is not all-important. Society does not need or want large families. Quality, not quantity, is the keynote of citizenship today. Sociologists tell us that the apportionment of four children to each married couple would keep the population in a static position. If we allow the maximum to each married teacher, her absence from school should not exceed normally four months for each child, making sixteen months all told in a teaching career, probably not more than might be caused by her single sister, as statistics show that as an institution marriage is conducive to the health of both husband and wife.

The single women teachers defend these marriage prohibitory laws on economic grounds.

The last census of the United States gives their numbers at 302,147. These women, presumably roundly educated, are largely against the married woman teaching. This seems to denote an ignorance of the very principles of economics. As long as the married teacher does not *undersell* her single sister, as long as she demands equal pay for equal work, she does not make an economic problem. The married woman, by retaining her place in the schoolroom, is not taking the bread rightfully belonging to another. The economic balance is maintained by the fact that she must, on her part, employ others fitted for tasks she has not time to perform. If she keeps house she must employ domestic servants; if she has children a competent mother's helper; she must pay to have her gowns made and garments mended.

She must pay to have done what a large part of the middle-class women do for themselves. This gives work to the inefficient or the derelicts who have neither the courage or strength to fight life's more strenuous battles, and who would otherwise be thrown upon society for support. Trades unions of women or those of men who admit women as members simply control the scale of wages irrespective of the marriage state. Single and married women receive the same consideration. Municipal and Federal civil service positions take the same view of the subject. If the teacher retains her position when her husband is well able to support her, the crime, if it be such, is no greater than is being perpetrated every day by girls and women whose fathers are well able to support them, but yet who, for reasons of their own, prefer work outside the home.

The married teacher has no desire to supplant the single. She only asks that teaching as a profession for women be

given the same dignity as for men. That she may make it her life work, with proficiency as a standard in fair competition with her equals. If, because of this proficiency, she supplants the woman who has entered the profession as a stop gap to marriage, with little special training, no aptitude, no genuine love for children, the inefficient woman, the public will not suffer, but gain. The married woman teacher asks only for fair play, for opportunity, for justice. When she gains these, girls will not think the time spent in its special training wasted. When the profession of teaching for women shall be a permanent thing, when a woman on entering it knows that she will never come to the cross-roads where she must decide between professional ambition and marriage, then we shall have the best women attracted to it. And then it shall receive the honorable recognition among other professions that has been shamefully denied it in the past.

NEW YORK, 1900.

Not by Bread Alone

BY SILAS X. FLOYD

ALAS, in these times, 'tis true in all climes, in spite of the lark that sings,
Man goeth apace in a mad wild race, and lays down his life for Things!
If we search far and wide, on every side, the end kept in view is the same;
Man counts for naught where the battles are fought, and Things is the end of
the game.

For butter and bread, with hurrying tread, man goeth forth to the fray;
And when more and more his larder runs o'er, he thinks he has won the day.
Men hold that their strength thruout the world's length is houses and money and
lands,
And so for their souls, from equator to poles, they lift not the weight of their
hands.

Thou Giver of All, who markest the fall of the sparrows that downward come,
Who seest our way by night and by day, of truth and of goodness the sum,
Grant we may learn man's greed to spurn, and know thine age-old plan
That *Things* is not the end of man's lot, but the end of Things is *man*.

Grant we may know, as onward we go, and the sun flies fast from the South,
That we should be spurred by every word which proceedeth out of Thy mouth.
Not alone for the sake of bread and of cake grant that Thy children may
strive;

But, oh! to the song of the lark all day long, may our souls be keenly alive!

AUGUSTA, GA.

Literature

Recollections of Literary Men

MR. WILLIAM WINTER'S latest volume* recounts the story of his friendships with many men eminent in the field of letters. Born in 1836, he began his literary career in Boston at the early age of eighteen. Later he came to New York, and was a member of the coterie known as The Bohemians, who met in Pfaff's, on Broadway, near Bleecker street, in the late fifties and early sixties. All his life has been spent within literary surroundings, and he has been particularly fortunate in his friendships.

Longfellow he knew well, and it is with a tender love and reverence that he recalls the poet in these pages. Longfellow's "usual aspect was that of a sweet, gentle, pensive composure." He had no resentments, not even against Poe, who so bitterly assailed him. He was wholly devoid of envy, or of any of the pettinesses so common in human nature. In the course of a warm friendship extending over many years, the author never heard Longfellow "utter a syllable of detraction of any contemporary author." Mr. Winter finds in him a greater likeness to Cowley than to any other poet. Yet he had "an acute sense of humor," which Cowley gives no evidence of having had.

Whitman he saw often in the earlier days, and cordially disliked. "That auctioneer's list of topics and appetites," he writes, "intertwisted with a formless proclamation of carnal propensities and universal democracy, has been hailed as grandly original and distinctly American, only because it is crude, shapeless and vulgar." "It is scarcely necessary to say," he writes again, "that he did not impress me as anything other than what he was, a commonplace, uncouth, and sometimes obnoxiously coarse writer, trying to be original by using a formless style, and celebrating the proletarians who make the world almost uninhabitable by their vulgarity."

Between Mr. Winter and Thomas Bailey Aldrich a lifelong friendship existed. They were born in the same year, and the first book of each appeared in 1854. The author's judgment of Aldrich's work is of course tinged by his warm personal regard. He believes that the poems, "sweet and tender, beautifully expressive of human affection—which is the immortal part of us—and lovely in style, will endure as long as anything endures in our language." Aldrich himself was not so certain, and indeed intimated that twenty years might find his work out of fashion and discarded. Fortunately, the signs of such a change are not yet evident.

Bayard Taylor was another of the author's intimate friends, and it is a deserved tribute which he pays, not only to the poet of "The Centennial Ode," but to the man and citizen.

Stoddard, Stedman and Holmes he knew well, Lowell and Dickens less well. He has affectionate, yet discriminating, praise for each of them. But upon George William Curtis, whom he knew intimately and for many years, he lavishes all the wealth of affectionate and reverent expression of which he is capable. In his life he was the greatest of our citizens; in his death, his memory remains as a perpetual benediction.

A Great Political Educator

ONE hundred and six years ago the back bench in the strangers' gallery in the famous old chapel of St. Stephen, at Westminster, was by Speaker Abbot, in a semi-official way, set apart as the place of the reporters for the London press in attendance on the House of Commons. In the century that has intervened many men who have made their mark in English journalism and literature have been of the press gallery; but in the whole of this long period no Parliamentary journalist has had a wider fame or reached a larger, more varied, or more widely scattered reading

*OLD FRIENDS. Being Recollections of Other Days. By William Winter. New York: Moffatt, Yard & Co. \$3.00.

constituency than Mr. H. W. Lucy. He was splendidly equipped for his work when, in the early seventies, he joined the Parliamentary corps of the *Daily News*, and by the time he set up as "Toby," of *Punch*, in 1880, he was already a national character. His vogue extended as years went by, and today he occupies a place that is unique in the history of English journalism. He has long been England's greatest political educator as far as the press is concerned. Every week from 1880 onward he has had more readers than any journalist who was ever of the Parliamentary gallery, and in these thirty years he has done more to concentrate public attention in England on what was doing by Lords and Commons at Westminster than all the editorial writers of the London daily press combined. He has become as much an institution of the House of Commons as the Speaker or the Sergeant-at-Arms. It consequently follows that many of the chapters in *Sixty Years in the Wilderness** are concerned with men who have been prominent in Parliamentary life since 1870. Disraeli, Gladstone, Salisbury, Bright, Chamberlain, Balfour, Randolph Churchill, Goschen, Campbell-Bannerman, Parnell and Biggar are all of the procession that is so well marshalled in the pages of Mr. Lucy's autobiography.

Humor and lightness of touch are Mr. Lucy's outstanding characteristics. It is these characteristics that will secure for Mr. Lucy's autobiography its widest acceptance. But there are two or three chapters that are of value for the new light they throw on English political history since the extensions of the Parliamentary franchise in 1867 and 1884-85. The most important of these is concerned with the split in the Liberal and Radical party over the first Home Rule bill in 1886. Two groups of Gladstone's followers then broke away. The Whigs who parted company with the Home Rule Liberals did so under the leadership of the late Duke of Devonshire, who in 1886 was still Lord Hartington, and member of the House of Commons for the Rosendale Division of the

County of Lancaster. The Radicals broke away under the leadership of Chamberlain. They were fifty-five in number, and constituted the larger group of seceders; and one of the most interesting political revelations in Mr. Lucy's pages—a revelation fully supported by letters—is the fact that had somebody not blundered, the Radical and larger group might have been reattached to Gladstone, and the whole current of English political history since 1886 might thereby have been changed.

It was inevitable that the Whig group should break away from Gladstone and the Liberals after the extension of the franchise in 1884-85. After the death of Palmerston in 1865 it was only tradition and the claims on office that tied the Whigs to the Liberal party. Long before the wide extension of the franchise in 1884 the Whigs had finished the mission that they had set themselves at the revolution in 1688. They had accomplished the mission by acting as the more progressive of the two historic political parties, and with that mission accomplished, and with the newer political life that began after the second extension of the franchise in 1867 making itself felt in the Liberal party, the natural affiliations of the Whigs with the Conservatives became more and more obvious. Had there been no Home Rule bill in 1886 the Liberal party must soon have shed its gradually diminishing Whig group. The Whigs must inevitably have fallen back into the Conservative party, where a territorial aristocracy today almost necessarily belongs.

But apart from the Home Rule bill, there were in 1886 no reasons for expecting the movement of a large and powerfully led group of Radicals into the Conservative ranks; and as has been said, one of the permanent values that attaches to Mr. Lucy's autobiography is the evidence it affords of the mismanagement of the delicate negotiations that were intended to heal the breach between the Gladstonian Liberals and the Radicals led by Chamberlain, who, in the epoch-making session of 1886 seceded from the progressive party and threw in their lot for all time with Salisbury and the Conservatives.

*SIXTY YEARS IN THE WILDERNESS. SOME REMINISCENCES OF ONE WHO, BY DEEDS AND LIFE, SET THE EXAMPLE. BY H. W. LUCY. NEW YORK: E. P. Dutton & Co., 1916. 12s. 6d.

Essays Biographical and Chemical. By Sir William Ramsay, K. C. B. New York: E. P. Dutton & Co. \$2.50 net.

There has long been and unfortunately still is a very widespread feeling of aversion among American scientific men of the first rank toward writing so-called "popular" scientific articles for the periodical press. How unfortunate this attitude is, both for the scientist himself as well as for the public, is emphasized from time to time by the appearance of a book like the one under review. Sir William Ramsay, by right of his achievements, undoubtedly ranks as one of the most eminent of living chemists. Yet he has found it neither impossible nor inexpedient to contribute from time to time to such papers as *The Youth's Companion* the delightful popular essays on a wide variety of scientific subjects which, collected, form the present volume. As the title indicates, the essays fall into two groups. The first half of the book is devoted to the biographical essays. These papers deal particularly with the lives of some seven commanding figures (mainly chemists) in the history of science, including Cavendish, Boyle, Black, Lord Kelvin and Berthelot. The chemical essays range in subject matter from the aurora borealis to the Becquerel rays. Charmingly modest and simple accounts of the epoch-making discoveries of Ramsay and his associates are given in two essays having the titles, "What Is an Element?" and "Radium and Its Products." An address on "The Functions of a University" closes the volume. In this, as in the more strictly scientific essays, the master mind goes straight to fundamentals:

"Its philosophical faculty should impart to those who enter its halls that faculty of increasing knowledge which cannot fail to be profitable not only to the intellect of the nation, but also to its industrial prosperity. I regard this as the chief function of a university."

Joaquin Miller's Poems. In six volumes. Vol. I, an Introduction, etc.; 16mo, pp. 236. San Francisco: The Whitaker & Ray Co. \$1.25 each.

Quite unconventional is the style of editorship of the present Vol. I received. It begins with a free autobiographical sketch, in which the poet tells about

"papa" and "mother," and the juvenile experiences on the frontier and among the Indians, followed by fragments from his journal describing his experiences as an American celebrity abroad after the appearance of his "Arizonian" and "Songs of the Sierras." Then we are given a sheaf of encomiums by English journals. All this occupies more than half the first volume, and the remainder is mostly given to selected poems, "Later Lines Preferred by London," "Lines That Papa Liked" and "Lines That Pleased Mother"; but interrupted with a prose story of "A Last Interview with Mother." THE INDEPENDENT has in past years published a great many of Joaquin Miller's poems and descriptions of Western life and scenery. He has a magic pen and has come to be, in his gray old age, a sort of more conventional Walt Whitman, but possessed of a rare musical gift of song, which is not a mere melody of vacant words. He is easily the chief as well as senior of our Western poets, and stands high in the ranks of all those of the last half century. We particularly admire in him his open-shirted democracy, his justice to Indian, Chinese or Jew, a protest ever against prejudice of race. It is clear that these six volumes will present him as he wishes to be handed down to posterity, frailties or aspersions denied or forgotten, and the genuine genius and the genuine gentleness of mind and heart held in memory. He is no long-haired, high-booted, sombrero-thatched, wild son of a gun, as sometimes reported, and such we have never seen him these forty years. He deserves the honor of these handsome volumes.

Star-Glow in Song. By Charles Buxton Going. New York: Harper & Brothers. \$1.20.

These verses are marked by clear thought, a terse, compressed, yet perfectly lucid expression, born, it may be, of two or three writers whose manner still holds the public attention. The general style is at present a composite, but one which is rapidly, judging by the contents of the volume under notice, clearing itself of the salient mannerisms of Kipling and Whitman—by skilful evolution ceasing to be an unconscious imitation of

either. A present, and the undoubted promise of a strong future of his own the poet has. His description of the charms of external nature is alive with beauty, and yet he knows how to arrange a sympathetic union—the only union likely to last—between the accurate facts of nature and the dream-facts of a hopeful, sound-minded thinker. This union is more effective in the very musical “Voices of the Sky” than in such pieces as “Songs of the Silences,” Whitmanesque as they are. Verses in the Kipling key—like “Outward Bound,” for instance, or like the “Song of the Seafolk” and “The Master,” are delightfully poetical, with values of their own, quite independent of the school in which they must be classed. The sea jargon in them is effectively used as a means to an end, while, with Kipling, whose work they suggest, the growing habit is to make jargon of various kinds an end in itself. It is again a tendency of the day in all literature to treat the mind sanitarially—that is, to convey us all at our leisure moments to literature to take healing waters. The novel or the poem is turned into a health resort, where a sort of “gold-cure” is administered to a staggering organization. Of this the reader grows somewhat weary. He would gladly have the gold in another form. The glinting pearl he would rather see exhibited without the nutritious oyster. Served on the half-shell and treated with lemon-juice, pearls are less effective than when seen under a soft chin reflecting their luster from a swan-like neck. Yet one willingly forgives Mr. Going for administering a gentle corrective in the case of an ill-treated mariner, when it is done with so much neatness and skill as that employed in his “Story of Skipper Ireson.”

Chapters of Opera. Being Historical and Critical Observations and Records Concerning the Lyric Drama in New York from Its Earliest Days Down to the Present Time. By Henry Edward Krehbiel. New York: Henry Holt & Co. \$3.50.

Mr. H. E. Krehbiel is a modest man. He gives us a big fat octavo volume of 435 pages recounting the detailed and intimate history of the lyric drama in New York City from the days of the earliest blooming of that exotic plant on

this soil down to the year of our Lord 1908, and he calls it *Chapters of Opera*. The musical editor of the New York Tribune was preeminently fitted for the task he set himself and he has carried it thru with brilliant success. His own extensive recollections and records carry him back to the third quarter of the nineteenth century, thus enabling him to give at first hand a most entertaining account of the first twenty-five years of the Metropolitan Opera House. For his first seven chapters, dealing with local operatic doings before “the consulship of Mapleson,” he has supplemented his own memories by industrious research into the contemporary chronicles of the earlier days and by the testimony of such a venerable survivor as Mrs. Julia Ward Howe, who heard some of the performances of the Garcia troupe which in 1825 gave the first representations (worthy the name) of Italian opera in America. The interesting story of the successive attempts at opera-giving in New York is made to yield abundant entertainment at his hands, for the book is not merely a chronicle of happenings and events, tho as such it is remarkably full and complete, but is also a criticism, frank and free, and often trenchant; and Mr. Krehbiel’s style is rich in the blandishments of grace, humor, allusion and the deft handling of personal anecdote. Along with the account of operatic rivalries—as rife in the early days as in the season lately ended—with the stirring incidents of the rise and fall of one impresario after another and the building and burning down of opera houses, the operas performed here are described with appreciative care and thoroness and the singers concerned in their representation receive ample critical consideration; nor are their personal qualities, engaging and otherwise, neglected. This critic sets himself strenuously against the newest spirit manifested in operatic art and his comments on such recent works as “Thaïs,” “Louise,” “Salome” and “Peléas et Mélisande” make lively reading. The remarkable achievements of Mr. Oscar Hammerstein at his new Manhattan Opera House are chronicled, not without praise for their meritorious features.

The Legends of the Jews. Vol. I, Bible Times and Characters, from Creation to Jacob, by Louis Ginzberg, translated by Henrietta Szold. Pages xviii, 424. Philadelphia: The Jewish Publication Society of America. \$2.00.

For one who wishes to grasp the inner history of the Jews, the traditions of this people are invaluable, for there is the thought-life of the nation, when it was a nation, and afterward, as it can be traced nowhere else. Dr. Ginzberg is one of the younger scholars who is so well acquainted with the sources that he has been able to present the traditions classified according to the biblical characters with which they have to do. In this first of four volumes he has been able to cover the creation of the world, Adam, Noah, Abraham and Jacob, drawing his tales from various Midrashim, from the midrashic portions of the Talmud, and other works of the kind. While many of the tales may seem extravagant and fastastic to the Occidental reader, let him not forget that these are Oriental tales, and that in the East free rein is given to the imagination. The old rabbis knew how extravagant some of the stories were, and applied a maxim, "You should not question metaphorical explanations," thus licensing the play of the imagination, and permitting the allegorizer to utilize the text of the Bible most freely for teaching any moral lesson. These tales are really expressions of the Hebrew mind wrestling with the problems of biblical interpretation and the difficulties of life itself, and offering solutions of all these difficulties as nearly as possible. The arrangement of the tales is excellent and the translation most happy. Many may be astonished to see how the old Hebrews answered, a few centuries ago, such questions as where Cain got his wife, and how Adam lived after being driven from Eden.

Misery and Its Causes. By Dr. Edward T. Devine. New York: The Macmillan Co. \$1.25.

"This is a war budget. We wage implacable war against poverty," said Mr. Lloyd-George, in closing his British budget speech. Dr. Devine's book is the plan of campaign for such a war in America, a plan laid out by the com-

mander of a most active and efficient corps in the anti-poverty army, the organized charity workers. While the survey of the strongholds of misery that await attack is depressing, the calm confidence of the general that all are vulnerable lightens the gloom. His strategy is so far-reaching and so ably argued, his knowledge of the hostile forces so exact, his confidence so unwavering, that the reader almost hears the victorious shouts of the regiments making the onslaught. "Poverty can and must be abolished"; that is the rallying cry. It has given fresh spirit to both volunteers and regulars. For long time it was shouted by Socialist guerrillas, single tax raiders and unorganized volunteers. They had neither the strength, prestige nor discipline to command confidence and carry important positions. But the great army of health officers, prison reformers and friendly visitors, of workers in hospitals, asylums, almshouses, reformatories and homes of refuge, on child labor and tenement house committees, in public education associations and unemployment bureaus—these are a formidable host that, once led to an attack on poverty itself as the arch enemy, will carry positions that have looked impregnable. Their expectations are audacious and yet sane:

"Sound heredity; protected childhood; a prolonged working age; freedom from preventable disease and from professional crime; indemnity against the economic losses occasioned by death, accident, illness and compulsory idleness; rational education; charity; normal standards of living and a social religion—these surely are not unreasonable demands. I hope one day to see them incorporated in a political platform. They are all in line of proved and attainable ambitions. No revolutionary principle need be invoked to compass these ends."

England and the English. By Price Collier. New York: Charles Scribner's Sons. \$1.50.

This is a clever and entertaining account of some features of British life—an account accurate, fair-minded and penetrating. Evidently the writer has been hospitably received by the ruling sections of Britain during his prolonged stay in the country, for he has acquired a respect and admiration for them so deep as to make his book a valuable anti-

dote to the anti-English sentiment so long cultivated in America by Irishmen. Britain is a man's country to a degree which arouses wonder that American heiresses choose to migrate thither. Social life "meekly adapts itself to the man's duties and desires." Most conspicuous and numerous among the stores are those which supply male needs. An Englishman is recognized by "all the inmates of his home as the absolute master there." Can it be that American women who endow impecunious lords actually enjoy this subordination? "English women do not make such demands upon the time and the engagements of their husbands as American women." Withal (marvelous to relate!), "one may say, humbly and with apologies to his countrymen, that this masculine dominance is not altogether a failure." These men, whose womenkind devote themselves to aiding the male in keeping "fit" and "in condition," have appropriated most of the world, and have been so successful as to acquire a contempt for "foreigners" that is exasperatingly cool and Olympian. But they are not idlers, tho, from highest to lowest, they do worship sport. They perform their patriotic duties, these thousands of unpaid rulers, in parish, city, county and state, with unflinching devotion; and "when England arrives at her Pass of Thermopylæ, this large class will have to be reckoned with, and I venture to prophesy that there will not be even one left to tell the news, if things go against them."

Gillette's Industrial Solution. By Melvin L. Severy. Boston: The Ball Publishing Co. \$1.50.

This, the companion volume to "Gillette's Social Redemption," also lacks, alas, that brightness, sharpness and handiness, without which the razor which made Mr. Gillette famous could not have furnished the funds for such publications. Two solid volumes of six hundred pages each, a compendium on economics, sociology, Single Tax, Socialism, the money problem and many other questions that plague humanity, are a tribute to the industry, thoughtfulness and broad-mindedness of this business man and his editor; but they are hardly more adapted to

their purpose, the introduction of Mr. Gillette's own Plan for Social Redemption, than a battle axe for shaving. This dauntless razor magnate proposes nothing less than a World Corporation Investment Company with unlimited capitalization in one dollar shares, which will buy out all the useful industries of the globe. Mars and the moon are not yet included in the prospectus. Finance boards and directorates are to be elected by shareholders on a system "studiously democratic." As these bodies increase in size in proportion to the number of shareholders they will presently "sit as a joint board constituting what will be known as the World Corporation Congress." It is proposed "to issue thruout the world a daily publication giving in full all the transactions of the corporation." Every shareholder will have a right to a job and will be morally elevated by his membership, for "the man who produced anything but the very highest and purest grade of products would find himself a social pariah unable to get any sort of employment until he had proved his moral reformation."

Plays, Acting and Music. By Arthur Symonds. New York: F. P. Dutton & Co. \$2.00 net.

Mr. Symonds is no dramatic critic, because he cannot escape his enthusiasms; professional theater-going is irksome to him, and the plays he attempts to review have an unfriendly relation to the artistic point he sets out to prove. The spirit of art to the critic of the stage is the product of diverse elements which distinguish the theater from music, painting, the dance, and yet which embrace all forms into one greater art—the drama. But as a poet, as a symbolist who prefers the essence to the thing, Mr. Symonds has no surety of view, no liking for paint, patches and powder. It is unfortunate that the fashion has become prevalent of late for every critic of a paper or of a weekly to put his casual theater reviews into book form. In the re-issue of *Plays, Acting and Music*, Arthur Symonds is himself only in flashes; he sits uncomfortably in his orchestra chair, while the woman—Duse, Bernhardt or Réjane—passes before the footlights. As a poet,

he is more concerned with the woman in the artist, than with the artist in the woman; and, while to a certain extent this is effective, picturesque criticism—to lay stress on the way a particular temperament bites into a part—it is just as requisite for the critic to measure the significance of the part. He must, in going to the theater, maintain a balance between the personal and the impersonal in acting. Mr. Symons is a theorist regarding the theater—a believer in puppets because he admires his master-symbolist, Maeterlinck; a believer in the rhythm of speech because first he is a poet, and second, like Mr. Huneker, he is closer to music than to the simulated life of drama. As a literary taster, Mr. Symons is pleasant to read; in the mundane activity of the stage he wanders like some artist athirst for beauty.

Neglected Neighbors in the National Capital. By Charles F. Weller. Philadelphia: The John C. Winston Co. Price, \$1.50 net.

This book was written in connection with the work of the President's Homes Commission, appointed by President Roosevelt to investigate living conditions in the District of Columbia. The author, who acted as executive secretary of the Homes Commission, was until recently, the secretary of the Associated Charities of Washington. When the report of the President's Homes Commission was published during the last session of Congress as a Senate document, it attracted considerable attention because of its exposition of the bad living conditions prevailing among the poor of the nation's capital. Mr. Weller, by substituting vivid and sympathetic narratives, profusely illustrated by photographs for the dry statistical method of the Homes Commission, exhibits the miserable conditions in a more glaring and effective manner. It is a common belief that the national capital is free from the loathsome conditions of poverty which prevail in the large manufacturing cities of the land. This, however, is a delusion. Washington not only has its "slums," but, unlike most other cities, its poor are found in almost all sections. A resident of the richest and most exclusive quarter

has merely to look out of the back window of his home to see the shack of his "neglected neighbors" hidden away in a blind alley. It is only of late years that the disgraceful housing conditions prevailing in the Washington alleys has been brought to the attention of the public and in this movement Mr. Weller has taken an important part. It is hoped that his book will lead Congress to provide for properly enforcing decent housing regulations in the District of Columbia, which will not only be of local benefit, but which will serve as a model for other municipalities.

Personal Recollections of Wagner. By Angelo Neumann. Translated by Edith Livermore. New York: Henry Holt & Co. \$2.50 net.

If Richard Wagner be not the greatest musical genius the world has ever known, as many of his admirers hold, it is at least safe to say that a larger literature has sprung up about him and his music than has been devoted to any other musician who ever lived. This book, which has already gone thru four editions in Germany, is a valuable addition to the literature about him. Angelo Neumann has been probably the foremost producer of Wagner's music dramas. As manager of the Leipsic Opera he gave the first performances outside of Bayreuth of the "Nibelungen Ring," and with such success that Wagner showed his appreciation and confidence by allowing him to form a traveling Wagner Theater, which gave performances of the cycle in the leading cities of Germany, Austria, Italy, Holland, Belgium, England and Russia. From 1876 till a few days before Wagner's death in 1883 these two men kept up a regular correspondence, most of which is printed in this volume. Neumann had met Wagner before the "Festival" of 1876, and gives some highly interesting details of rehearsals of "Tannhäuser" and "Lohengrin" under Wagner's personal direction in Vienna, in 1875. Wagner's letters to Neumann give the book its main interest, of course. They were written at a time when he was writing less than previously, and better than any other collection of his letters they reveal him as a business man—and a very capable and shrewd

business man at that. There are many interesting glimpses "behind the scenes," many good anecdotes of noted conductors, singers, critics, and many things of special interest to American readers concerning Anton Seidl who was the conductor of Neumann's troupe, by choice of Wagner himself, and who later did so much for the cause of Wagner, and the cause of music indeed, here in the Western World. As a sample of the many good things the book contains about "the master," the following anecdote must suffice:

"His little admonition to the musicians" (at a rehearsal in Berlin) "was most characteristic and worthy to be noted by many an orchestra of this day. 'Gentlemen,' he said, 'I beg of you not to take my "fortissimo" too seriously! Where you see "ff," make a "fp" of it, and for "piano" play "pianissimo." Remember how many of you there are down there, against the one poor human throat up here alone on the stage.'"

Literary Notes

....An unassuming but thoroly enjoyable little pocket companion for the nature lover will be found in Winthrop Packard's *Wild Pastures*. The author does not force the note; he is not manufacturing "copy" in these eleven brief papers; he simply writes because he wishes to communicate to others the delights he finds in fields and woods and among their wild denizens. His eyes see much, as do the eyes of all who love Nature; and he describes well. (Small, Maynard & Co., \$1.20.)

....Exceptionally well worth a reader's while is *A Holiday in Connemara*, by Mr. Stephen Gwynn, M. P., who brings to his subject enthusiasm, understanding and much knowledge. The natural beauties of the district he describes appreciatively; he deals sympathetically with its inhabitants and their condition; he has a ready eye for the customs and peculiarities of their primitive life, an ear for their legends and superstitions, and much familiarity with the great "Irish question." A book for Irishmen first of all, perhaps, and for Englishmen next, but also a readable book for us, even tho Irish politics interest us but little, for the picturesqueness of Connemara is in these pages. (Macmillan Co., 12mo., \$2 net.)

....Ex-Assistant Secretary of the Navy Frank Warren Hackett has collected in book form, under the title of *Deck and Field*, his two addresses before the United States Naval War College, and a number of others delivered on various occasions, at Flag Day exercises in Washington, before the Society of the Sons of the Revolution, at the unveiling of the tablet to Farragut in the Portsmouth Navy Yard, in memory of President McKinley, General Schofield and others, the dates of these addresses

-ranging from 1892 to 1908. An appendix contains some miscellaneous material—a brief tribute to Admiral Sampson, contributed to a Washington paper, a review of Buell's Life of John Paul Jones, in the light of the controversy over its reliability, etc. The book is indexed. (Washington, D. C.: W. H. Lowdermilk & Co.)

....A work of exceptional interest for the student of progressive research in all the departments of religious thought is being issued in parts by the house of J. C. B. Mohr, of Tübingen, under the title of *Die Religion in Geschichte und Gegenwart*. It is edited by Dr. F. N. Schiele, with the special cooperation of Prof. H. Gunkel and Otto Scheel. The work will be completed in perhaps five large volumes, costing 100 marks and will be a *summa summarum* of all that modern religious thought teaches on religions and Biblical subjects. More than two hundred contributors, the leaders in Church thought and life in the Fatherland, are writing the articles, and the book is intended not for the specialist, but for the general student who wants the latest and what by advanced thinkers is regarded as the best. The latest heft brings the article "Bibel."

Pebbles

BARBER—Your hair's very thin, sir.
Long Sufferer—And you've got a bump on your nose, and one of your eyes squints.

GUIDE—After this point there's no vegetation, five hundred metres higher, no beer, and, after another five hundred, no post-cards.—*Meggendorfer Blätter*.

FATHER—Now, look here, you girls, when you grow up one of you must be able to speak French, and the other German.

Brenda—All right, dad; and Muriel had better learn German, because she can gargle best. *French*.

'THERE was a wild African gnu
Who was feeling gexceedingly gblu.
If Teddy spots me
And gshoots off my g,'
He observed, 'What the gdeuce shall I gdu?' "
The Commonwealth.

ONE day (an ever memorable date)
I found the place where Horace Fletcher ate;
And when I asked, "What is the secret,
Hod?"
He said: "'T is Masticate and Masticate.

"Some from the Stack of Buckwheat Cakes
are barred,
And others cannot eat things Cooked in Lard;
Ridiculous! Just get an appetite,
Then pick out what you like and chew it
hard!"

S. Thoughtless Eater, when you get to be
Decrepit at the age of eighty-three,
You'll see a Lithe Old Gentleman at golf,
Or running Marathons, and he'll be Me.

—*Puck*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2 00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

The New Tariff

THE House tariff bill, while it had some commendable features, did not keep the promise of the Republican platform, as that platform had been interpreted by Mr. Taft. By the admission of those by whom it was made, it increased the Dingley tariff's average ad valorem rate of about 42.50 per cent. to 45.72 per cent. This did not indicate a reduction of duties which, as Mr. Taft said, had become "generally excessive," or that "substantial downward revision" which the platform, in his judgment, demanded. The bill prepared by Mr. Aldrich and his associates, and passed in the Senate, was still more at variance with the requirements which the President had pointed out. This is well known. The conference committee could act only with respect to the differing votes of Senate and House. Compromise was expected, and compromise could not bring the final bill down even to the level of the bill of the House. Owing to the President's interference, the action of the committee was more in the direction of reduction than it otherwise would have been; but if the promise to the people was broken in the House bill, it was even more clearly broken in the bill which has become a law.

Undoubtedly, the President believed that the assertions in his published statement were fully warranted by the provisions of the bill. But he was misled by some one who desired that certain facts should be withheld from him. There is an example in his reference to cotton goods. There have been very few increases, he says, except with regard to liquors, silks and "some high classes of cottons, all of which may be treated as luxuries." Now, the most glaring increases in the cotton goods schedule are those which affect duties upon cotton cloth of the cheap grades, such as are bought and used by persons of small means. Such cotton cloth is not a luxury.

Of the decreases which in his judgment justify the statement that the bill is a substantial downward revision, many are purely spectacular. That is to say, duties which were not needed for protection have been cut down, and the resulting duties are not needed. Certain duties that were prohibitory will still be prohibitory, altho there has been a decrease. Much of this kind of work is seen in the iron and steel schedule. While the reductions were being made, an American steel company was underbidding the English manufacturers in supplying rails for a street railway company in Glasgow, selling at \$29.60 per ton there while the English makers' price was \$41.25. Another American company was selling 20,000 tons of rails in Argentina, competing successfully there with all the rail manufacturers of Europe. A sharp reduction of a duty not needed for protection does not count for much in a scheme of honest downward revision.

The party promised, the President says, to reduce duties when they "exceeded the difference between the cost of production abroad and here." This excess "has not been reduced in a number of cases," but he believes that a great majority of the rates are low enough to permit, "in case of abnormal increase of demand and raising of prices, the possibility of the importation of the foreign article and thus to prevent excessive prices." Unfortunately, there was no attempt to ascertain that difference in production costs of which the Republican platform speaks. Those who asked the Finance Committee, during the Senate debate, for

evidence on this point were repelled and scoffed at. The German Government was insulted because—at the request of our Government—it had collected information as to production costs in Germany and sent it to Washington. It was impossible to drag this information from the pigeon hole in which Mr. Aldrich's committee had placed it, and not until the end of the session was it printed.

A tariff bill framed in accord with that platform doctrine would not closely resemble the Payne tariff. Those costs of production, per unit of product, should be ascertained. Mr. Taft says:

"The authority to the President to use agents to assist him in the application of the maximum and minimum section or the statute, and to enable officials to administer the law, give a wide latitude for the acquisition, under circumstances favorable to its truth, of information in respect to the price and cost of production of goods at home and abroad, which will throw much light on the operation of the present tariff and be of primary importance as officially collected data upon which future Executive action and Executive recommendations may be based."

But can he use those experts or agents, for the employment of which the bill provides, to ascertain the costs of production? In a colloquy with Mr. Beveridge, Mr. Hale, a member of the Finance Committee and of the conference committee, asserted that he could not. He explained that to prevent such use of them the committee had cut out the words by which the authority would have been granted and had sought to confine the work of the agents to inquiries concerning discrimination by foreign countries. Mr. Aldrich was not in agreement with Mr. Hale about this, but it may be that Mr. Hale's interpretation of the bill is correct. It was his aim, of course, and the aim of many others, to prevent an official inquiry which would show that the rule of the platform has not been followed in practice.

It is reported that the President intends to make, by means of competent agents, an investigation as to production costs in the cotton goods and woolen goods schedules. We hope the report is well founded and that, if Mr. Hale and his associates have interposed serious obstacles, the President will ask Congress to remove them. Such an inquiry as to those two schedules would furnish a

foundation for duties determined with due regard to a rule which many regard as a reasonable one.

We do not think Mr. Taft would have signed the bill if he had realized how much at variance with the platform rule a great many of its provisions are and how many jobs of one kind or another are in it. Having been misled as to these defects, and being an advocate of important parts of the bill outside of the tariff duties—such as the net earnings tax and the customs court—he gave his approval, although he was satisfied, as he says, that the measure was not "a complete compliance with the promises made, strictly interpreted." Eventually he will know more about the tariff duties in the bill than he does now, and as the disagreeable truth comes to him, the insurgent Republican Senators will begin to have his sympathy. He speaks of "future Executive action and Executive recommendations." We expect that if he collects "official data" relating to costs of production, those recommendations will call for revision of parts of the Payne tariff.

The Final Report of the Country Life Commission

THE full report of the Country Life Commission has just reached us. A shorter report having been given out some weeks ago. Broadly speaking the commission finds that agriculture in the United States is prosperous, and it finds that the conditions are improving over most of the country. Advance is due largely to the influence of agricultural colleges and experiment stations, as well as to the United States Department of Agriculture, all of these agencies having proved to be active and influential. While secondary schools have not yet become tributary to the farmer, public sentiment is demanding a change in that direction, and the change is coming. There has never been a time when the American farmer was in as good shape financially as just now, and he went thru the crash of the last two or three years without serious damage.

The commission, however, is unwilling to base its report on present conditions. It wishes to know how near real

efficiency measures up to possibilities. It sees that the social readjustment which has taken place during the last fifty years has affected the farmer less than his neighbors in city and village. Older people are still retiring to town life, partly because society is more attractive and partly because school advantages are preferable. Then again the farming interest is not receiving its due share of interest for the capital and labor expended. The farmer is disadvantaged when he deals with other business interests and with other social groups. The commission classifies his handicaps under these four heads: Speculative holding of lands; monopolistic control of streams; wastage of forests, and restraint of trade.

Land owners have been allowed, often by questionable methods, to get control of vast areas of agricultural land. They not only establish their own prices, but they are able to prevent the development of small agricultural communities—developing a system of tenantry and absentee farming. This evil is markedly developed in the West and South. Swamp lands also have been largely secured by corporations, and their subdivision into small farm units prevented. The Federal Government is urged to make a vigorous inquiry into the present holdings of these lands, and to take legal steps to rescind unwarranted grants. This evil barely touches our Eastern States.

Of considerable general importance is the suggestion that our whole country would be greatly benefited by a systematic conservation of our watercourses, small as well as great. Their protection from monopoly is one of the first responsibilities of government. There should be a constructive program, under conditions insuring the permanent control of all streams in the interest of the people, and more particularly the farmers. The commission of course has in mind the use of our small water powers to do our farm work, beside furnishing electric lighting and running small manufactures. "It is more important that small power be developed on the farms of the United States than that we harness Niagara." Unfortunately these sources of power are easily passing, on

their own terms, to private parties. Monopoly of water power is going to be one of the worst evils that will beset farming during the next twenty-five years. Already thirty-three per cent. of the developed water powers of the country are under the control of a group of thirteen companies. "Waterlordism" is as much to be feared as "landlordism." The bounding brooks in New England and New York are going to be of quite as much importance to the coming farmer as the streams that are dammed for irrigation in the Western States.

The commission lays emphasis on the new crisis that has come upon us concerning lumber and fuel. Our forests have been exploited for private gain, until the timber has been seriously reduced, and the streams ruined for navigation and irrigation, and whole regions exposed to floods and soil erosion. History shows no instance of any other such reckless destruction of property, and it still goes on. We have inbred into our people an instinct to destroy. The tariff discussion in Congress concerning our lumber interests illustrates this American temperament. The commission calls for more and larger forest reservations, to control the sources of streams, and prevent timber famine.

Loss of soil by washing has already taken away the tillable surface from thousands of American farms. This is the heaviest impost says James J. Hill, borne by the American farmer. Orton advises going back to the old-time woodlot, and the commission seconds his suggestion. Every farm should have its woodlot once more, however small; and these should be managed conservatively according to the rules of good forestry. "In many regions, where poor land prevails, the town or county could afford to hold forest land and make it a source of revenue for the community." Such forests in Europe are quite common; owned and managed by the towns and yielding them a revenue.

The commission gives a good deal of space to the complaint, which is said to be almost universal, against transportation companies and middlemen. The Interstate Commerce Commission is, however, in charge of this matter, and has laid itself open to appeals from the

farmer. It is held to be of great benefit to our agricultural interests. Its rulings may occasionally be unwise, or meddling, in fact doing damage both to the producer and the hauler, but we believe that the farmers are generally satisfied. Dissatisfaction with prevailing systems of marketing, involves the whole subject of middlemen, and their necessity. It is held to be wise, where possible, for the producer and the consumer to come together; but the commission men are an absolute necessity for handling a large part of the produce of the country. What the farmer wants is some system for holding these men responsible. There are enough rascals among them to bring the whole business into disrepute, and quite enough to dishearten the fruit grower, who is not seldom brought into debt to the middleman.

Among the remedies of a general sort, strongly emphasized by the commission for the hindrances to successful farming, we have urged a parcels post and a postal savings bank system. The parcels post is demanded by the farmer as the one reform that he specially needs. A thoro study of the relation of taxation to the welfare of the farmer is urged, in order to determine what discriminations exist, and what legislation is needed. This investigation should include the entire middleman system, farmers co-operative organizations, transportation rates, taxation of agricultural property, loan methods, and the entire range of economic questions involved in the farmer's business affairs. "The farmer should be safeguarded in any new legislation on the tariff." One of his particular needs is a carrying out of the reciprocity principle in such a way as to open European markets for our flour and meats. To dispose of our corn crop and grain crop profitably requires the best market that can be secured.

Soil depletion is a new topic with most farmers. Up to the present time farming has been the exploitation of virgin land. This sort of farming may last one or two more generations, but already on common land we have reached the limit. We have got to learn how to make soil; not merely to keep soil from waste and exhaustion, but to add to its quantity and its fertility. The farmer can no longer

desert his farm and take up a new homestead where the exhaustion has not been forced upon the soil; he has got to learn how to handle his homestead in such a way as to save it from deterioration. The real farmer tackles this problem, and he easily comes out victor. Worn out soil is merely a sign of stupid ignorance and recklessness. The social results are as bad as the financial. The only reason why the Southern States fell behind the Northern was the bad habit of using up fertility; and yet the Southern farms can be renovated and new soil created more rapidly than in the North.

The completed report is a much more satisfactory document than the rather composite sketch previously given us. Its value lies in the knowledge accumulated by our agricultural colleges as to the needs of the country, rather than to any fresh facts acquired by the commission. They have given us an admirable treatise which should be widely circulated. Too much attention cannot be given to our productive forces. The tariff as a means of revenue is nowhere when compared with our power to create wealth from the soil. A great continental nation like the United States must be fundamentally a producing people. Agriculture must be our special characteristic; beyond commerce and beyond manufactures. We have yet to learn to feed ourselves, and to do it abundantly as well as economically, however large our population may become. We reserve the social and religious features of the report for discussion next week and the week after.

Poor Spelling and Its Cause

PROFESSOR BAILEY's statistical *exposé* of Yale spelling throws light on many interesting points. It shows for one thing that there is a certain degree of justice in the general opinion that a poor speller is deficient in scholarship. The misspelling of a word like its mispronunciation is, indeed, a trivial error in itself, not so bad as illegible writing and not at all comparable with a misstatement of fact however slight, but it does indicate some mental defect, a lack of observation or of memory, a habit of carelessness or of procrastination. If Professor Bailey

had asked his students which way an elephant bends his hind legs or how many windows there are in Connecticut Hall the Phi Beta Kappa's would still have made a better record than the conditioned men.

But the poor students may take some consolation from the fact that their very mistakes are indicative of some rudimentary logical ability, altho misapplied. They have attempted to deduce the spelling of a word from its sound or from analogy with similar words, and for all the forms of misspelling quoted some such "evidence" could be produced. Their mistake was in attempting to reason about anything so essentially unreasonable as English spelling. They should have known that they could not tell from the present pronunciation of a word or from its derivation, how some seventeenth century compositor, very likely an imported Dutchman, chose to spell it.

The reason why the Chinese students did better is because they did not apply their logical faculties at all, but depended on their trained powers of observation and memory. In order to spell correctly you have to put half your brain, and the better half, out of commission, otherwise it will get you into trouble. There is no excuse for a Chinese on the one hand or a German or a Spaniard on the other to be a poor speller. The latter languages are pretty nearly phonetic and the former is not phonetic at all. A Chinese student learns the characters of his language as he learns the faces of his friends. Even an artist cannot pronounce a face, each feature a syllable, but he can draw it. It is because English is in between German and Chinese, having the virtue of neither, that poor spelling is an ineradicable disease of the language in its present state. It purports to be phonetic but does not keep it up. That is why it is a continual irritation like a piano with some of the keys out of tune. What some of us are trying to do is to get rid of the evil of misspelling by gradually introducing a little more of system and logic into the language.

But in the meantime there is no reason for being pessimistic about the faulty spelling of the present day, or for making any revolutionary changes in our school methods to remedy it. The students of today, even the college students, spell bet-

ter than they ever did before. The idea that the average spelling was better than in the days when this study was the *pièce de résistance* of the schools has been exploded by digging up the old examination papers and comparing with those of the present, as has been done at Springfield. If Professor Bailey will search the archives of Yale for the manuscript theses of 1809 he will find reason to be encouraged by the progress of the century. And perhaps in another century or two there will be no need to learn to spell for the students may be able to put into writing, without any mental strain or anxiety, any word he can speak.

So Wags the World

On August 8, in this year of grace 1909, we picked up the Sunday newspapers to see how the human race was coming on. Our mood was not that attributed by Byron to the Prince of Darkness when he came to the surface to

"Visit his snug little farm of the world,
And see how his stock came on."

We desired rather to find some new evidence that, with its overwhelming and bewildering progress in material achievement, the race of man was becoming wiser, more kindly, more interested in knowledge and in good deeds. The tariff bill had been signed; the English Channel had been crossed by a Frenchman in a flying machine, and the Czar of all the Russias had visited King Edward of England without running into a dynamite bomb. Surely the world might begin to think about things beautiful and of good report. This is what we discovered:

We caught the headline: "Flood of Cheap Writing. Professor Burton Says that This is the Scrap-book Age in America." The paragraph below purported to quote Professor Richard Burton, of the University of Michigan, who, we were informed, had been telling a Chautauqua audience that this country is flooded with cheap literature unfit for reading. This did not sound encouraging, but the lecturer, an optimistic and kindly soul, did not leave us as those without hope. The time is coming, he predicted,

"When women will take a larger part in our public affairs and enjoy a franchise, and when

this time comes, there will be a change in regard to the literature that comes into our homes."

Doubtless we were dull, but we did not quite grasp the nexus of cause and effect. However, we did not wish to miss some great truth thru inadequacy of investigation, so we bethought ourselves of the land where the suffragette movement is more advanced than it is with us. We turned to the English news. Perhaps, we reflected, in the realm where woman has defied Parliament in its own sacred halls, and has been willing to go to jail for her principles, we shall find that the heroic, the epic note has already been struck in the literature of a new and glorious age.

It was Mr. H. G. Wells that we encountered, and we were not prepared for the paralyzing pessimism of his report. Not a word had he to say of the emancipation of a sex, not a word of the epic note. His mind was on Blériot and the gasoline kite, and, next to that, it was on the decadence of the English male. "We have fallen behind in the quality of our manhood," he announced. Either the English "are a people essentially and incurably inferior," he lamented, or there is something wrong in their training, or something benumbing in their "atmosphere and circumstances."

It might be the atmosphere, we thought—the spiritual, the intellectual atmosphere, and Mr. Wells seemed to think so too. The "foreigner" not only has a more nimble mind, Wells argued, but he also enjoys a different *milieu*. His novels "are not kindly, sedative pap; his uncensored plays deal with reality," and "his home has books in it and thought and conversation."

At this point our preconceived opinions began to stagger. We had been carefully taught in our youth that it was the Englishman's home that had books and thought in it, while as for the Frenchman's home and his uncensored plays, the less said about them the better. So we turned again to Mr. Wells for further light. This is the summing up that we found:

"Our homes and schools are relatively dull and unimaging; there is no intellectual guide or stir in them; and to that we owe this new generation of nicely behaved, unenterprising sons who play golf and dominate the tailoring

of the world, while Brazilians, Frenchmen, Americans and Germans fly."

It was only too obvious that the light of hope was not gleaming from Albion. Might it then be, after all, and contrary to our mistaken notions, that we must look to France, *la belle*, for the grand, the virile element in the new civilization?

To France we turned, and of course to the latest word of M. Marcel Prevost, him of the unfailing eye and the philosophic mind. He would know whether in the age of woman's supremacy the scrapbook mode in literature would happily pass away.

Alas and alas, we found what Prevost had to say, and it was only this:

"The principle of the day is that the attractiveness of woman no longer lies in her intellectual qualities, nor in her charm and beauty, but in her elegance. And by elegance one does not mean the fineness and harmony of her being, but the manner in which she is adorned. To be beautiful means in our time to be well dressed."

We laid the papers down. Why should we look further? America, England, France, all gone to the bad! Civilization a shame! Even woman a failure! One splendid reality alone was left to us. The American crops of 1909 will be worth eight billion dollars!

Cleveland's Street Railways Mayor Tom L. Johnson suffered another defeat in Cleveland, last week, when the people, at a referendum election, gave a majority of nearly 4,000 against his latest proposition in the interest of three-cent fares on the street railways. This proposition was that a franchise to operate cars, with three-cent fares, in a certain part of the city, should be granted to Herman Schmidt, one of the Mayor's associates and an advocate of his policy. This franchise, if granted, was to be the basis of extensions of the service over about three-quarters of the city. As the people have decided against it, an effort will now be made, it is said, to obtain their support for the plan proposed by Judge Tayler, in whose court took place the receivership proceedings relating to the street railway companies. He would have a revaluation of the street railway property, and would then grant a comprehensive franchise, limited to twenty-five

years, with three-cent fares (and transfers at one cent) if experiment should show that they would pay six per cent. upon the value fixed by the appraisers. If these fares should not be sufficient, provision would be made for an increase within certain limits. The situation is one of many complications. Owing to political animosity, labor disputes, receiverships, etc., the railway service has been carried on under serious disadvantages. It may be that the city longs for a settlement of some kind, and for peace, and therefore is inclined to favor Judge Tayler's plan. We have never seen any proof that Mayor Johnson was moved by anything less creditable than a desire to demonstrate that three-cent fares will yield a reasonable profit, upon an honest capitalization, and that the people are justly entitled to railway service at such a rate. The plan finally adopted may not be his own, but it can be foreseen that as a result of his efforts there will be a permanent reduction of car fares in Cleveland.

Discrimination on a Government Railroad We should expect that freight rates on the Panama Railroad, which is owned and operated by our Government, would be as low for American shippers and American goods as for European patrons and products. It appears, however, that there is sharp discrimination against our own people. At the suggestion of Mr. Taft, an inquiry has been made by Bernard M. Baker, formerly well known as the head of the Atlantic Transport Line. Mr. Baker shows that freight charges for dry goods sent to Central America from the United States are higher than for goods sent from Europe to the same destination; that about twenty per cent. more must be paid for transportation across the Isthmus when the goods come from New York than when they come from Europe; that there is a similar discrimination with respect to machinery going to the west coast of South America, and that the charge on machinery from New York to San Francisco, by way of Panama, is \$36, against \$18.82 if the machinery comes from Europe. He cites other examples. Moreover, his inquiry was checked by a refusal of

the officers in charge to give him the figures he needed. In the case of machinery forwarded to San Francisco, noted above, the differing charges on the railroad alone are \$8.10 and \$4.59. One explanation is that the discriminatory rates were inherited from the Southern Pacific Railroad Company, which formerly owned the route. This may explain, but it does not excuse. Such an inheritance should have been rejected promptly by the local representatives of our Government. It is strange that this discrimination has so long escaped the attention of their superior officers. The places of those who are directly responsible for it should at once be filled by better men.

Galveston's Example

The commission form of city government, originating with Galveston, Tex., is proving a boon to other cities which have adopted it. Dallas, styled the most cosmopolitan city of Texas, has been governed under this plan now for something over two years, with results highly creditable to that municipality. The tax rate has been reduced, the streets paved, an adequate water supply is being projected, and at a recent city election an issue of bonds was voted providing for a viaduct across the Trinity River, which will permanently connect the city with the town of Oak Cliff, originally a separate community, but by a recent act of the Legislature made a part of Dallas. In addition to all this, the police and fire departments have been improved and strengthened, parks and playgrounds have been bought and beautified, and no graft of any kind can be found in any department of the city government. It looks as tho this plan for municipal control were worthy of investigation by all of our cities.

James J. Hill Industrialism is gradually developing a new and broader type of man than it furnished us in the Fisks or in the Astors and Vanderbilts. The wonderful thing about Mr. Carnegie is not his benevolence, but his foresight; his rich talent for measuring our material and intellectual tendencies correlatively. Several of the labor leaders, such as Mr. Mitchell,

have done a good deal to enlarge the views and tendencies of the unions. In Mr. James J. Hill we have a man who not only commands detail marvelously, but uses detail synthetically, and sees the bearing on the whole community. Minnesota took the occasion of her day at the Alaska-Yukon Exposition to unveil a bronze bust of this distinguished citizen of her State. Governor Johnson went to Seattle to deliver the address, and Baron Takahira represented Japan, which country has a particularly strong regard for Mr. Hill. The power of these new industrialists to organize and lead men makes of this great railroad builder the highest order of statesman.

Anti-Saloon Catholics The Roman Catholic Church has not been so outspoken an advocate of strong temperance measures as have most of the Protestant churches and there are more saloonkeepers professing that faith than any other. But as an indication that the Church is not to be left behind in the advance movement against the saloon it is encouraging to note the demonstration in Chicago last week when 5,000 members of the Catholic Total Abstinence Union of America met in the Auditorium and a procession of twenty temperance organizations marched thru the streets. The official attitude of the Church on the liquor question was interpreted by the Rev. James M. Reardon, of St. Paul, in the following language:

"For this reason the fathers of the plenary councils of Baltimore exhorted patrons and implored them 'to make every possible effort to exterminate the vice of intemperance' by warning their flocks against its subtle dangers, by admonishing them to keep away from saloons, by crying out fearlessly against drunkenness and whatever contributes to it, by preaching in season and out of season in the words of the apostle: 'Drunkards shall not possess the kingdom of God.'"

"In this warfare for the honor of the Church the laity are exhorted to join in order that a strong public sentiment may be engendered against alcoholic indulgence, to the end that all Christians may 'be filled with zeal against this vice and for the love of God and of country endeavor to root out this pestilential evil.'"

"Furthermore, while the selling of liquor is not declared to be unlawful in itself, Catholics engaged in it are admonished to choose 'a more becoming way of making a living'; and if they do not heed the warning voice of the Church in this matter, but persist in dispensing alcoholic

beverages to the public, they expose themselves to grave personal danger, besides constituting themselves occasions of sin to others. For their own sakes, therefore, as well as for the spiritual good of their patrons, the Church forbids them to sell drink to minors and to those who they foresee will abuse it. 'They must,' says the third plenary council of Baltimore, 'keep their saloons closed on Sunday and never allow blasphemy, cursing, or obscene language. Saloonkeepers should know that if, through their culpable neglect or co-operation, religion is brought into contempt or men brought to ruin, there is an avenger in heaven who will surely exact from them the severest penalties.'"

The Eyesight of School Children

The best thing about "scare stories" is that they are usually not so.

For many years our schools have been accused of ruining the eyesight of the rising generation, and assumedly of their descendants thru heredity until the whole human race shall be spectacted. But now, that the subject has been thoroly investigated, it appears that there is little danger of the first calamity and none at all of the second. Heredity is indeed the most important factor but there is no reason to think that the effects of eye-strain are inherited. If a child has good sight or poor it is probable that he gets the defect from his parents even tho it appear late in his school life. This at least is the conclusion reached by the Galton Eugenics Laboratory after a careful study of the reports of several thousand school children in Edinburgh, Glasgow and London. The investigators find that there is no sufficient evidence that school environment has a deleterious effect on the eyesight of children. The changes of vision occur during school years, they are phases of a law of growth, due to an inherited tendency to pass from hypermetropia to emmetropia and myopia. The home life is also cleared from blame. "There is no evidence whatever that overcrowded, poverty-stricken homes or physically ill-conditioned or immoral parentages are markedly detrimental to the children's eyesight." N. Bishop Harman comes to a similar conclusion as the result of his extensive study of London school children. He says:

"There is no evidence on which to base a pessimistic attitude toward the general tendency of a healthy school life in so far as the emuliation of the eyes of the child population is concerned."

The Czar If nations are to have any intercourse at all with each other they must deal with the legitimate or illegitimate governments that happen to exist in accordance with the time-honored rules of courtesy and good faith. Accordingly the British Government was quite right in according the Czar on his visit to England last week the same hospitality it would to the Emperor of Japan, the President of the United States or any other ruler enjoying the love and confidence of a united people. Nevertheless we take pleasure in printing the following letter from Arthur M. Granfelt, of Cambridge, Mass., who protests against the above sentiments expressed in our issue of July 22:

"It seems to me that you do not quite understand the Russian situation as it is today and as it has been. It is absolutely wrong to say that the Czar of Russia represents the whole nation; the fact is that he represents only the official and part of the criminal Russia. I, with millions of people, have the greatest admiration and sympathy for the Russian nation, but for the bureaucratic Russia and its representative, no just man, knowing the conditions, can have anything but the feeling of contempt. How is it possible to say that the Czar represents the whole nation knowing, for instance, that petitions signed by thousand and hundreds of thousands of peaceful subjects in which the petitioners ask for the simplest of human rights are not even received by the Czar? On the other hand it is a known fact that the Czar is an honorary member of the "Society of True Russians," whose well-known purpose is to arrange for political murders, massacres of Jews, etc. The Czar assists this organization with money, and grants immunity to the perpetrators of murders committed under its auspices. He is in close contact, and exchanges telegrams with the leader of the organization, Dr. Dubrovin, a notorious criminal, who arranged the murder of Jollo, a member of the Duma. Dr. Dubrovin is also charged by the Finnish courts with being the instigator of the murder of Herzenstein, another Duma member; and now lately he has been accused of having made arrangements for the murder of Count Witte. Dr. Dubrovin and his organization are guilty of scores of similar crimes and the Czar as 'high protector' and 'honorary member' cannot clear himself of the complicity."

Lutherana Synodical conventions, large and small, were recently held in large numbers in all parts of the Lutheran Church of the land. At the meeting of the General Synod, held in Richmond, Ind., it was decided to adhere only to the Augsburg Confession as a sufficient and adequate

creed, and not to regard as binding the other confessions, as this is done by the General Council, the Synodical Conference and practically all of the independent church bodies of this, the third largest Protestant body in America. In general, it appeared again, that the tendencies in the Lutheran Church, in contrast to those of other leading denominations, are pronouncedly conservative, and in none of the theological seminaries or Church bodies has there been a yielding in such matters as verbal inspiration, the divinity of Christ and other fundamentals. However sadly and badly divided as the Lutheran Church is along language and practical lines, confessionally she stands firmer than ever on the old platform of the Reformation. As one result of this—at least as claimed by the Lutherans themselves—there has been no decrease in the number of theological students in the various seminaries. Indeed, those in St. Louis, Springfield, Ill.; Columbus, O., and elsewhere report record-breaking attendance during the past academic year, and yet the supply does not nearly equal the demand. The St. Louis Seminary alone sent out nearly one hundred men into the ministry this year. No other Church in the country is so little affected by the newer theology of the day as is the Lutheran.

Marriage to a Deceased Wife's Sister That English Church Council, which at its recent session in London, condemned marriage with a deceased wife's sister by a vote of 224 to 14, has no real authority. Bishops and other ecclesiastical dignitaries were members, but it is a purely voluntary association, and we are surprised that it should undertake to vote on the subject, and to reprobate the use of the Prayer Book in solemnizing such unions. Parliament, the only authority which has any right to rule in the matter, has decided that such marriages are legal. There is no Bible against them, and if there were a Mosaic prohibition it would have no more validity than the command to sprinkle the ashes of a red heifer, or to raise up seed to a brother who has died childless. The action of the Council is not simply impertinent; it prejudices the public against the meddle-

some Church. Is it not plain that when the State has decided such marriages lawful, it is well that they should be solemnized with all religious weight by the Church? Of course, it will be declared that it is not the State, but the Church, that rules in marriage; but the whole world knows better.

We hear and see often a comment like the following, which we take from the Montgomery, Ala., *Advertiser*, which a correspondent sends us:

"It would doubtless surprise many Northern people to learn that notwithstanding the munificent gifts made to certain negro colleges in recent years from Northern sources, the South has spent \$50 for educating the negro where the North has spent one. . . . This fact does not seem known in certain quarters of the North, and if known, it seems ignored."

THE INDEPENDENT is perfectly well aware that by public taxation many times more is paid in the South for the education of negro children than is given by Northern charity, but we see nothing peculiar in it. It is precisely the same in the North, where \$100 is given by public taxation for educating poor children to every dollar that is given by charity. Of course, it ought to be so.

Cannot this loathsome Thaw mess be ended? All this examination and re-examination is a disgrace to the bar and bench, the principal degenerate in the case is not worth the thousands of dollars the people have had to pay to bring him to so-called justice, and the widespread publicity given by a degraded press is a menace to public morals. If a rich murderer can make such a mockery of justice it is high time that our methods of legal procedure were thoroly revised. And the spectacle of the Thaw family testifying now this and now that, the District Attorney and murderer exchanging jokes at the trial, and the alienists reversing their opinions as often as desired is not the least stench in the case.

Now that all of the effects of the storm which recently visited the Texas coast have been ascertained, the value of the Galveston sea wall stands out in bold relief. No considerable damage was felt in the city, and, while the storm was probably nearly equal in force to that of 1900, which cost the city more than 8,000

lives, no real harm resulted, and in the city itself no lives were lost. This carries with it a salient suggestion to other coast cities exposed to possible danger from storms or tidal waves.

The Manchurian railroad question may be best understood by an analogy. Japan refuses to allow China to extend the railroad from Peking into the interior of Manchuria, and insists, in spite of China's protest, on running a line into that region from Korea. This is much the same as if Great Britain should refuse to allow the United States to extend a railroad from New York into the Mississippi Valley and should instead insist upon running a line from Chicago to Montreal.

The Government lottery of Italy last year received \$16,800,000 from the players and returned only \$8,000,000 in prizes. Let the collectivists put this into their scrap-books, for it is another instance where State management is more efficient than private enterprise. Monte Carlo only exacts an average commission of about 5 per cent. of the money placed on the roulette tables, so the Italian Government is ten times as successful at robbing the people.

Who will say that the world does not move? In the Protestant Episcopal Diocesan Council of South Carolina, meeting in Spartanburg, by a vote of 14 to 7 of the clergy and 17 to 12 of the laity, women were given the right to vote at church elections, except in cases where the by-laws of the parish forbid. Now those prohibitive by-laws will have to be changed. And it is time for other States to follow the progressive State of South Carolina.

The impecunious gentlemen who own private yachts are greatly exercised over the tax imposed by the new tariff on their pleasure craft. The only consolation we can offer is that contained in the casual remark of a philosophical tramp who said of the income tax, "Give me the income, and I'll pay the tax."

Mr. Taft employs the driver, brassie, lofter, mid iron and putter against his adversaries, but as yet not the Ananias Club.

Old Men Now and Under the New Regime

THERE is a very decided contrast between the pessimism of Dr. William Osler, who holds that a man's usefulness either terminates at the age of forty or is at least then very much abrogated, and the optimism of Actuary John K. Gore, of the Prudential Insurance Company of America. Mr. Gore, in a recent address before the Actuarial Society, pointed out the fact that there has been a decrease in the average mortality rate. Life insurance companies are, of course, keenly interested in the subject of longevity, because all their calculations are based upon the so-called "expectation of life," and if to the span of life as reached in present day average something could be added it would naturally have an important influence upon the reckonings of all life insurance companies.

Great improvements have taken place in our day in sanitary conditions. There now prevails an enlarged knowledge of diseases and the proper method of combating them. Thanks to the comparatively new science of bacteriology, not to cite other scientific progressions, we have overcome many previously baffling diseases. Not much extension of the length of life, so far as extreme age is concerned, has as yet been made. There is, however, much reason for hope in this regard. The question confronting us, according to Mr. Gore, is, Can the duration of human life be prolonged? If 95 to 100 years of life be now the limit, will it be possible sooner or later for this age span to be advanced so that he who is now regarded as senile at age seventy and long past usefulness by Osler, if not held to be adolescent, will at the very least be looked upon as middle aged by the really aged persons of the future? Mr. Gore holds that the weaknesses of human nature causing death from particular reasons must always be reckoned with. Exposure and reckless habits in early life, resulting in various diseases, debauchery and dissipation, leading to

suicide, etc., can never be entirely eliminated. Improvements in living may easily reduce even these causes of mortality, and a general building up of the moral and vital energies must give a stronger and a longer hold upon life in the average. If with the aid of such improvements the average man may with confidence look forward to living from twenty-five to fifty years beyond the age which is now considered as the limit, the future holds something for us far and away beyond what Osler would have us think. It would be a good thing also for the insurance companies, and when this revolution takes place the present insurance rates will sympathetically yield to revolution.

IN a general way it may truly be said of insurance contracts, as of all other contracts, that the parties thereto ought to carefully read the same before signing them. It is far better to do this before rather than after.

ONE of the hazards to be reckoned with during the present summer season is the common house fly (*Musca domestica*). This insect is provided with many minute hairs as leg appendages. To these hairs disease germs cling with much tenacity, and flies frequenting filthy recesses of sewers and other foul places, refuse heaps and manure piles, gather together pathogenic bacteria and other noxious germs, which they distribute over a very wide area. These common house flies are, with mice and rats, veritable death spreaders. They contaminate the food on our tables; they introduce deadly germs into our homes and increase the hazards of eating houses, fruit stands and barrows. The multiplication of flies goes on so rapidly that but for the tremendous mortality among them the Egyptian plague of flies might easily be repeated. Could we but eliminate the mosquito, the fly and the rodents we would have gone a very long distance toward reducing the death rate. The killing of a single fly may be but little short of a public benefaction.

Financial

The Business Situation

REPORTS of production and trade continued last week to be of an encouraging character, those relating to the cotton crop excepted. Following the close of July came the statement of pig iron output for the month. For the first time this year the monthly total exceeds 2,000,000 tons. To July 2,101,579 tons are credited. This year's gains and the low records made in the corresponding months of last year are shown below:

	1908.	1907.
July	2,101,579	1,218,129
June	1,929,884	1,088,034
May	1,883,330	1,149,688
April	1,738,877	1,149,002
March	1,836,194	1,228,204
February	1,707,340	1,079,721
January	1,797,560	1,045,250

The output is still growing, for the weekly capacity of furnaces in blast was 488,742 tons at the end of the month, against 463,029 at the beginning of it. Of the entire quantity, the Steel Corporation's furnaces produced 1,030,661 tons, or nearly half. The Corporation has advanced the price of bars, plates and beams, following the addition of \$2 per ton to the price of wire products week before last. Charles M. Schwab says that \$5,000,000 is about to be expended in enlarging the plant of the Bethlehem Steel Company. The Pennsylvania Railroad Company has ordered 8,000 cars, at a cost of about \$8,500,000. This is said to be the largest order of its kind ever given at one time. The company will soon buy 5,000 more. Other orders reported last week are 3,000 for the Burlington and 2,400 for the New York Central. In the stock market, Steel Corporation common shares rose to 77½. Advances were made in the general list, Union Pacific rising to 204¾.

Favorable news about the growing corn was received. The crop promises to be the largest ever harvested. The editor of the *American Agriculturist* estimates the value of farm products this year at \$8,100,000,000, an increase of \$322,000,000 over last year's figures. On the 2d, the Government's report showed that the condition of the cotton crop on July 25

was 71.9, against 74.6 a month earlier, 83 a year ago, and a ten years average of 80.6. The price of cotton at once advanced. It is generally estimated that the crop will not exceed 11,500,000 bales, which may be compared with 13,600,000 last year and 11,300,000 in 1907.

There is exceptional activity in building operations. The growth of deposits has given the savings banks large sums for investment. Mr. Vanderlip, president of the National City Bank, returning from a tour in the West, says he was impressed by the size and condition of the crops. In his opinion, the country is at the beginning of a long period of commercial activity. "Business will be so good," he says, "that we shall soon forget about the tariff." Mr. Vanderlip has been notably successful heretofore in his predictions.

....During July railroad and industrial corporations in this country issued \$121,486,100 of new securities, against \$87,309,000 in July a year ago.

....In the last fiscal year the revenue collected by the Government from manufacturers of distilled or fermented liquors was less by \$7,041,978 than the collections in the preceding year.

....It is now expected that one-fourth of the Chinese railroad loan, originally assigned to English, German and French bankers, will be awarded to the syndicate of New York bankers, whose demand for participation has the support of the Government at Washington.

....There were actual sales of a few hundred tons of copper last week on the New York Metal Exchange. The Mercantile Exchange, incorporated in 1875 by dealers in butter, eggs, cheese, etc., is another institution whose quotations have been made by a committee, and concerning which the recommendation of Governor Hughes's committee of investigation was that its charter should be annulled because the Exchange served no useful trade purpose. A general meeting of this Exchange's members will soon decide what course shall be taken in the direction of reform.

VOL. LXVII NEW YORK, THURSDAY, AUGUST 19, 1909.

No. 3168

Survey of the World

The President's Vacation

Mr. Taft has been resting at his cottage on the coast at Beverly, Mass., giving a little time to business that cannot be avoided, but getting much recreation on the golf links and in automobiles. He approved, last week, the appointments of 330 Census supervisors. His policy concerning these appointments had already been made known. It was that in nine surely Democratic States of the South there should be an equal division between Republicans and Democrats, with the condition that no one selected should be an active partisan, and that supervisors elsewhere should be Republicans, this being the rule in the four "debatable" States of Missouri, Kentucky, Tennessee, and North Carolina. As no appropriation for the new Customs Court was made, the appointment of judges will be postponed. The five experts who are to procure information to assist the President in enforcing the new tariff law will soon be selected. Some progress will be made in perfecting plans for the proposed amendment of the Anti-Trust law and a new distribution of the duties of the Interstate Commerce Commission and of certain department bureaus.—Senator Burton and six other members of the National Waterways Commission sailed on the 10th for Europe, where they will spend ten weeks in making inquiries.—The leading conservative Democrats of the State of New York have called a conference, to be held at Saratoga on September 9, "to inaugurate a movement to unite the Democrats of New York so that they may again form an effective and militant party, based upon real Democratic principles." It is understood that the movement is hostile to the lead-

ership of William J. Conners, now chairman of the State Committee.—The Alabama Legislature by unanimous vote has approved the proposed income tax amendment to the Constitution. Connecticut's Legislature has deferred action until the next session. In Georgia the Senate, by a large majority, declined to take up the question. Those who oppose approval there argue that power to tax incomes should be reserved for the State.

Tariff Aftermath Our existing reciprocal commercial agreements with foreign countries are to be terminated, owing to the maximum and minimum provisions of the new tariff. Some dissatisfaction is expressed abroad because it has been determined at Washington, owing partly to the date of warning notices and to the requirements of the agreements themselves, that they shall expire at different dates. Thus, the date for France and Switzerland is October 31 next, the date for Germany February 7, and the date for Spain, Italy and Portugal August 7. This lack of uniformity permits, and even may require, temporary discrimination in tariff rates against certain countries and in favor of others.—Senator Cummins, of Iowa, a prominent Republican insurgent, on his journey homeward stopped in Chicago and there published a statement. He said:

"The Democratic party has demonstrated thoroly its innocuous inability to be trusted with the formulation of a tariff law for the United States. I do not foresee any serious possibility of a Democratic Congressional or National victory because of the passage of the new tariff law. Any Republican law based upon the underlying principle of protection is preferable to any Democratic law based upon

the principle of tariff for revenue. All Republicans will hold the tariff as a Democratic Congress heaves in sight. In my judgment the tariff never again will be an issue between the Republican and Democratic parties. It is the decisive issue between the two well-defined elements within the Republican party. It is an issue which must and I believe will be settled definitely at the next national convention."

The insurgents, or progressives, he continued, should strive in all local or other conventions to place in control men who will stand firmly by platform pledges; should insist upon the appointment of an expert tariff commission, and should call from time to time for revision of particular schedules. There should be no opposition to President Taft. The Senator said he was ready to begin a speaking campaign in support of the policy thus outlined.—Senator La Follette, in an address at Winterset, Ia., on the 12th, attacked Senator Aldrich, referring to the sugar duties of the Dingley tariff and to the combination of trolley railroads in and near Providence.—Replying to criticism in his own State, Senator Dixon, of Montana, who stood with Senator Aldrich in the tariff contest, asserts that the tariff bill has been misrepresented by great daily journals because the duty on print paper was not removed. "The great metropolitan papers," he says in a published letter, "threatened from the start that if we did not single them out for special favor in this matter they would misrepresent the tariff bill to the country, which they have undoubtedly done."

Water Power Sites on Public Lands Addresses made at the National Irrigation Congress in Spokane, last week, directed attention to a controversy between Secretary Ballinger and Chief Forester Pinchot concerning withdrawals of public lands from entry. It is understood that while Mr. Ballinger was Land Commissioner, before the end of President Roosevelt's term, he was in disagreement with Mr. Pinchot on this question, altho both supported Mr. Roosevelt's policy for the conservation of natural resources. Secretary Garfield was in full agreement with Mr. Pinchot. When Mr. Ballinger succeeded Mr. Garfield as Secretary of the Interior, the course of the Department with respect to withdrawal of land from entry was

changed to some extent. On the last day of his term, President Roosevelt signed an order withdrawing about 1,000,000 acres in Montana and Wyoming, the purpose of this action being to prevent the acquisition of valuable water-power sites by great corporations. Under Secretary Ballinger's rule, a few days later, this order was rescinded and the lands were thrown open for entry. Owing to protests, however, small tracts, said to control the power sites, were afterward withdrawn again, and certain entries that had been made were suspended in order that Congress might consider the questions involved. In his address at Spokane, on the 10th, Mr. Pinchot did not directly attack or criticise Secretary Ballinger, but it was commonly understood that what he said was aimed at the Secretary. He warned the Congress of "the eager, rapid, unwearied absorption, by the Water Power Trust, of rights which belong to all the people." It is understood that Secretary Ballinger had defended his modification of Secretary Garfield's policy upon the ground that the large withdrawals were not warranted by a strict interpretation of the law. A considerable part of Mr. Pinchot's address related to this defense, altho the Secretary was not mentioned. "To follow blindly the letter of the law," said he, "without intelligent regard both for its spirit and for the public welfare, is nearly as dangerous as to disregard the law altogether." Rigid construction of the law, he asserted, favored the great "interests" as against the people. Ex-Governor Pardee, of California, sharply attacked the Secretary in several speeches, giving elaborate statements of withdrawals, restorations, entries, etc., and asserting that after the reversal of Mr. Roosevelt's last order of withdrawal the power sites involved were taken by persons representing great combinations in the copper and smelting industries. This has been denied at Washington, where it is asserted that no entries of that character were made during the weeks in which the entire tract was open. The official record appears to be conclusive on that point. Mr. Pardee's statement showed that more than 4,000,000 acres withdrawn by Secretary Garfield had been thrown open by his successor. Denial of this has not been published.

On the 13th, following the adjournment of the Congress, the Department withdrew 87,000 acres along the Colorado River in Utah, to prevent the acquisition of power sites by monopolies.

Our Islands in the Pacific

The Hawaiian planters decline to employ again those Japanese who were prominent in the recent strike. They are striving to procure laborers in Europe and elsewhere, and they hope to end in this way the labor domination of the Japanese in the islands. A few Filipinos have arrived, 750 more have been engaged, and it is expected that several thousand will be induced to take up the work which Japanese have been doing. Agents of the planters are looking for laborers in Portugal, and 250 Russians are on their way to Honolulu. The work of about 200 Filipinos employed during the last two years has been quite satisfactory. There are about 70,000 Japanese in Hawaii.—It is expected that our new tariff will stimulate the sugar and tobacco industries in the Philippines, and that the limits of quantity to be exported to the States will be reached within three years. The Government will give to consumers a guarantee that the cigars exported were made under sanitary conditions.—The board which has been investigating the mutiny of a company of constabulary at Davao, in June, has made a report demanding the resignations of Captain Platka and Lieutenant Dunsworth, the dismissal of Lieutenant Debelaine, and the reduction in grade of Lieutenant Goicouria. The board says these officers were either not properly qualified for their places or had punished privates unjustly.—A search for lepers has been made in the Philippines by agents of the Government, who have found 2,000 and expect to find about 600 more.

Unrest in Mexico

Owing to signs of revolt against Federal authority in the northeastern States of Coahuila and Nuevo Leon, President Diaz has given General Trevino, of the army, full power to deal with the situation there. Miguel Cardenas, Governor of Coahuila, was removed from his office some days ago by

the President, but the State Legislature has refused to accept his forced resignation and by unanimous vote has opposed Señor Pena, whose name was submitted for the office by the Government. Governor Cardenas is regarded as a political ally of General Reyes, who for some years past has been Governor of the adjoining State of Nuevo Leon, and is the candidate for Vice-President of those who oppose President Diaz and his plan for the re-election of Vice-President Corral. At the end of last week it was announced that Governor Reyes also had been removed from office. Troops were assembling in the two capitals, Monterey and Saltillo, with a view to the establishment of military rule. The opposition of the Coahuila Legislature to Federal authority is said to be without precedent.—The Government insists upon the substitution of Mexicans for Americans so far as practicable in all offices connected with the railways which the Government controls.—José Randel and Thomas Sarabia, leaders of last year's revolutionary uprising, were arrested on the 11th in San Antonio. With them were taken a supply of rifles and much correspondence relating to the movement, including a list of the names of supporters, who are said to be scattered about in this country from New York to Los Angeles. The letters show that an invasion of Mexico from Texas, in October next, by five armed parties, has recently been under discussion.

Affairs in Venezuela

Acting President Gomez was elected Provisional President of Venezuela, on the 12th, by unanimous vote in Congress, and he has the support of the entire Venezuelan press. The protocol for a settlement of the claims of this country by arbitration was accepted by Congress on the same day. It was made known on the 13th, by the State Department at Washington, that a settlement preceding arbitration had been reached with respect to the claim of the United States and Venezuela Company, which involves certain asphalt deposits. Venezuela pays \$475,000 and takes the property, which was covered by a concession granted in 1901.—Reports from Caracas say that very little is left of Castro's property in Ven-

ezuela, which was valued at \$5,000,000. Much of it has disappeared by reason of the reorganization of companies in which he was interested. For example, he owned shares representing an interest of one-fifth in the Cigarette Trust, capitalized at \$5,000,000. Not long ago the company was sold to one Guerra for \$250,000, altho it is said that the shares were quoted at a premium. Then a new company, from which he was excluded, was formed. His interest, which had thus been reduced to \$50,000, was at once attached by the plaintiffs in several suits for damages. In a similar manner his interest in a navigation monopoly on the Orinoco was cut down. A German named Hauer, asserting that he had bought Castro's cigarette shares, attempted to defend his interest in them. He has been arrested for promoting a revolution in favor of Castro, and it is said that papers found in his possession warrant the charge.

Bolivia and Peru

The situation in Bolivia before the inauguration of the new President, Dr. Eleodoro Villazon, was regarded at Washington as critical. It was known that Dr. Villazon, formerly Minister to Argentina, was of the opinion that his country should accept the decision of President Alcorta concerning the territory in dispute between Bolivia and Peru, and that the war party at La Paz desired to retain in office the retiring President, Montes, who had the support of the army. But President Villazon was inaugurated peacefully on the 12th. Diplomatic influence and that of foreign business interests had been exerted to preserve order. The new President appointed a strong Cabinet. Ex-President Pando was named for Minister of Foreign Affairs. Being opposed because he favored acceptance of the Alcorta award, he declined the office, which was then given to Sanchez Bustamente. In his inaugural message President Villazon said the award was an unjust one, and added:

"We must proceed circumspectly, and be guided by international law and the customs of civilized nations in similar cases. I consider it right to avail ourselves of the means offered by diplomacy to obtain a rectification of the new

frontier line given by arbitration, thus saving the compromised possessions of Bolivia."

It is reported that certain supporters of the retiring President sought war with Peru, expecting aid from Chili and hoping to gain for Bolivia a bit of coast, with a seaport.

English Notes The British Parliament is engaged in the consideration of the South African constitution. Some amendments are being made, but most of them are acceptable to the commissioners and not likely to endanger the accomplishment of the Union.—It is admitted by all parties that the financial bill of the Government has gained in popularity in the last few weeks and it is not probable that the Lords will venture to throw it out, much as they dislike some of its radical features such as the taxation of the unearned increment. Mr. Lloyd-George has been making a vigorous campaign for the bill by means of public speeches, in which he shows the enormous profits gained by the landlords thru the rise in the value of real estate due to the growth of cities. He takes for his illustrations mostly the Dukes of Northumberland and Westminster and other members of the House of Lords, and these personal attacks, tho bitterly resented, are undeniably effective.—The sub-committee of the Imperial Defense Committee, consisting of Premier Asquith, the Earl of Crewe, Viscount Morley, Sir Edward Grey and Mr. Haldane, which was appointed to consider the charges of mismanagement brought against Sir John Fisher, First Lord of the Admiralty, by Admiral Lord Charles Beresford, has brought in a report refuting these charges. Lord Beresford in his memorandum states that:

"During the whole of my tenure of the command of the Channel Fleet, that force, owing to the number of vessels constantly withdrawn from it for purposes of refit, has never even for a day been equal to the force which it might have to encounter in home waters. During that period the fleets in home waters have not been organized in readiness for war, and they are not organized in readiness for war now."

The sub-committee contradicts this in the following language:

"In the opinion of your committee, the investigation has shown that during the time in question no danger to the country resulted

from the Admiralty's arrangements for war, whether considered from the standpoint of the organization and distribution of the fleets, the number of ships or the preparation of war plans."

—The Cunard liner "Lucania" was burned at the Huskisson dock, Liverpool, on August 15. For fifteen hours the fire raged in spite of the incessant efforts of the firemen of the land and sea companies. The whole of the interior of the vessel forward of the funnels was burned out and it was not until the vessel sank in thirty feet of water that the fire was stopped. The "Lucania" was a sister ship to the "Campania," of 12,500 tons, carrying 1,400 passengers. She was built in 1893 at a cost of \$3,500,000, and broke the records of her day for the transatlantic passage.

The Swedish Strike The strike situation in Sweden is not yet relieved and the issue is still in doubt, both parties claiming ultimate victory. Accustomed as we are in America to regard violence as an inevitable concomitant of an extensive strike the almost complete absence of disorder seems most astonishing. No damage to property has been reported until the last few days, when a revolutionary branch of the Young Socialists procured some dynamite and attempted to use it to prevent the running of street cars. King Gustav has driven thru the streets without an escort, passing before the headquarters of the strikers. The precaution has been taken, however, to have a division of the fleet so placed as to command the royal palace. The streets of Stockholm have been kept lighted by gas and electricity, and street cars are run in Stockholm and Gothenburg by the aid of strike-breakers. Foreign steamers bring with them their own stevedores for handling their cargoes. The capital is again supplied with food at reasonable prices. The municipal authorities have threatened the cabmen with forfeiture of license if they do not return to work. The railroad men are reluctant to join the strike because they would lose their pensions. The printers were called out in the second week and generally responded, altho in so doing they violated contracts with their employers. The only paper that is

published regularly in Stockholm now is *The Answer*, the organ of the strikers. The other newspapers got out small editions on hand presses, while in southern Sweden the papers sent their copy to Denmark to be set up and printed. It is difficult to circulate them, however, because the news vendors refuse to handle any except socialistic and labor organs. In some industries or localities the strikers have gone back to work, but there are still about 285,700 strikers out of 460,000 workmen of all industries except railroading and agriculture. Some also of the farm hands have joined in the movement and the Farmers' Association has appealed to citizens of all classes to help in the harvesting in order to save the crop.

The Powers Intervene in Crete The Turkish note to Greece demanded in somewhat peremptory language the repudiation of all intentions to annex Crete. The Greek reply was conciliatory in tone and professes a desire for the most friendly relations. It calls attention to the cordial co-operation of the Greeks in Turkey with the Constitutional party during the recent revolution, and the care taken by the Greek Government to avoid any action tending to embarrass Turkey during the crisis. The Greek Government disavows any connection with the annexation movement in Crete, but states that it is not able to give any assurances as to the future of the island because its fate is in the hands of the Powers. The Grand Vizier, Hilmi Pasha, acknowledges that the Greek reply is on the whole acceptable, but he demands a more explicit assurance that Greece has no ambition in regard to Crete. This, of course, would be quite impossible since it is the ardent hope of every Greek patriot that the Cretans be allowed to come into the kingdom. But the Turkish Government is under great pressure from within. Some of the Young Turks believe that an easy and popular foreign war is just what is needed to consolidate the Turkish people and relieve the Constitutional Government of the charge of supineness and inability to prevent the territorial disintegration of the Ottoman Empire. Con-

sequently they are inclined to sympathize with the Albanian revolutionists in their efforts to overthrow the Government. The army, which is the dominant power in Turkey, is eager for war, altho its commander, Chefket Pasha, is believed to be exerting his influence to pacify the spirits of officers and men. The merchants in several of the Turkish ports have inaugurated a boycott against Greek goods, as they did against Austria not long ago. The chief cause of irritation has been the fact that the Greek flag was unofficially raised over the fortress of Canea as soon as the Powers evacuated the island, and guarded day and night by an armed body of Cretan volunteers. The Cretan Government expelled the defenders of the flag from the fortress but resigned in a body rather than lower the flag. The Powers have accordingly resumed responsibility for the island and British, Italian, Russian and French ships have been dispatched to Suda Bay with orders to remove the Greek flag and so obviate the invasion of the island by Turkish troops.

The Spaniards in Morocco

General Marina has now forty thousand or more troops under his command at Melilla and the entire Spanish fleet is assembled off the Riff coast to give him support, but he has not yet attempted any advance movement against the Moors surrounding him on the landward side. Two explanations are proffered to account for his inactivity; one is that he has not yet got so large and well-equipped a force as he thinks necessary, and the other is that the Spanish plan of campaign has been interfered with by the Powers. It is admitted that there has been an exchange of important diplomatic notes during the week, but their character can only be guessed. It seems that Spain is in the peculiar situation of being obliged to refuse offers to relieve her of a job that she would be glad to get rid of. Mulai Hafid, Sultan of Morocco, who at first turned a deaf ear to the request of Spain that he prevent his subjects on the Riff coast from attacking the Spanish railroads and mines, has now offered to take the matter in hand and put down the disorder. He has sent

General Bagdadi, commander-in-chief of the Moroccan troops, to instruct the tribesmen to cease hostilities, and he has requested General Marina to refrain in the meantime from any offensive movement. The French also manifest a disposition to undertake the task of punishing the tribesmen about Melilla as they did those about Casablanca. But it would be very humiliating to Spain to withdraw now just after a humiliating defeat or to accept foreign aid in defending a post which has been held by Spaniards ever since they drove the Moors from Spain. Skirmishing has been kept up day and night for the past week. The Moors cut the telegraph wires and occasionally the railroad connecting Melilla with the outposts to the southward, and the landing of supplies and munitions for the Spanish troops is rendered difficult on account of the incessant firing of the Moorish sharpshooters. On the other hand, the long-range bombardment of Mount Gurugu by the guns of the fleet and fort has done little harm because the Moors seek protection in the ravines of the mountains and the underground passages they have constructed. The Moors have made attacks upon two of the fortified islands held by the Spanish on the Riff coast, Penon de la Gomera and Alhucemas, but without much effect.

The Dispute Between China and Japan

Japan's emphatic announcement of her intention to proceed at once with the reconstruction of the railroad from Antung to Mukden without regard to Chinese opposition, seems to have gained her point. China at once consented to the changing of the width of the track from narrow to standard gauge, but asked that negotiations be resumed on the other points in dispute, such as the policing of the line. To this Japan promptly returned a conciliatory reply, agreeing to reopen negotiations at Mukden, altho insisting that the construction work already begun on the first section of the route should continue. China at the same time has issued a circular note to the Powers stating her side of the case in the following language:

"Japan has sought unjustified aggression abroad, to the detriment of South Manchuria.

she has outlined on several occasions the territorial rights of China, and she is trying to secure little by little new rights not specified in existing treaties.

"In the present case the attack on China's rights is flagrant. China, like Japan, now addresses herself to the Powers. She is conscious that she has defended not only her own legitimate rights, but the veritable interests of the Powers against the pretensions of Japan.

"The interest of the Powers is that no one shall occupy a privileged position in Manchuria. China will continue as heretofore to be inspired by her conscience of right and a spirit of fidelity to existing treaties. She refuses to grant to Japan the right to place new troops in China and exercise police functions in China. But in these negotiations China will continue to show patience and magnanimity."

China objects to Japan's claim that the railroad from Antung to Mukden is on the same basis as the South Manchurian Railroad from Port Arthur to Mukden in regard to Japan's claims that she has the same right to police the railroad from Antung to Mukden as she has in regard to the South Manchurian Railroad, from Port Arthur to Mukden, that is, of maintaining guards at the rate of fifteen per kilometer. This China refuses to allow, as it would mean the permanent addition of 4,000 more Japanese soldiers to the force which Japan now has in Manchuria. The clause in the Pekin convention on which Japan bases her claim to reconstruct the railroad reads as follows: "China agrees that Japan has the right to improve the Antung-Mukden Railway so as to make it fit for the conveyance of commercial goods of all nations." This China asserts does not warrant the laying of a new route and widening the gauge. Japan contends that when negotiating the agreement she had in view the reconstruction of this railway on standard gauge. China disclaims responsibility for what Japan had in view. The road at present, the Japanese say, is altogether inadequate for commerce, being laid hastily during the war when there was not time for bridges and tunnels. The curves are sharp and the grades steep. It requires two full days to make the journey of 188 miles from the Korean frontier at Antung to Mukden, the capital of Manchuria. Travel by night is impracticable. Three or four small passenger or freight cars constitute a maximum train and on some portions of the line these trains have to be broken into

two or three separate hauls. By reconstructing the line Japan will be aiding the commerce of all nations because the journey to Mukden will be shortened to ten hours by water and eight by land. China protests that an injustice was done the people of Manchuria because no compensation was ever paid when the railroad was built for the right of way, which occupied good corn land and village property; also that the owners of the land on which the new Japanese city of Antung was located received less than half its value.—The Chien-tao question is still the source of mutual recrimination between Japan and China. Both of them claim jurisdiction over the province, which lies north of Korea, and both maintain guards there, who are continually coming into conflict over the rights of the Koreans and Chinese settled there. —After the war China was eager to cultivate closer relations with Japan. Japanese were employed on the Chinese railways, electric light and telephone plants, in the army and police, in schools and colleges, and in many other capacities, and the young Chinese swarmed into the schools of Japan. Now all this is changed on account of the antagonism and suspicion which are growing up in China against the Japanese. Where not long ago there were over a thousand Japanese employed in China, now there are fewer than 400, and some of these will be discharged when their contracts expire. Three years ago there were more than 20,000 Chinese students in Japan, now the number is 5,125. The Government, which has been supporting 300 students in Japan, will in the future send but eighty-eight.—The Chinese Minister to this country, Wu Ting-fang, has been recalled and in his place will be sent Chang Yin-tang. Mr. Wu, who has always been very popular in this country on account of his adaptability and witty speeches, is now in Peru. It is expected that on his return to China he will continue the work which he began some years ago of codifying the Chinese laws. The new Minister speaks little English and has had no foreign education, but one of his sons is a graduate of the University of Pennsylvania and another son and a younger brother are being educated in Washington.

Confusion of Property with Privilege: Dartmouth College Case

BY JESSE F. ORTON, A.M., LL.B.

[In the issue of THE INDEPENDENT of April 16, 1908 President Hadley of Yale University contributed an epochal article, entitled "The Constitutional Position of Property in America," in which he said that the celebrated Dartmouth College decision and the Fourteenth Amendment had placed the modern industrial corporation in an "almost impregnable constitutional position" in the United States. "The fundamental division of powers in the Constitution of the United States," said he, "is between voters on the one hand and property owners on the other. The forces of democracy on one side, divided between the Executive and the Legislature, are set over against the forces of property on the other side, with the Judiciary as arbiter between them; the Constitution itself not only forbidding the Legislature and Executive to trench upon the rights of property, but compelling the Judiciary to define and uphold those rights in a manner provided by the Constitution itself." This article was followed in our issue of October 22 by "The Issue beyond the Parties," contributed by Dr. Delos F. Wilcox, who commented on the great significance of President Hadley's article in its relation to the development of the movement toward a fundamental democracy. We have been impressed so much by the significance of this discussion that we have planned to continue it somewhat exhaustively, and accordingly present this week a critical review of the Dartmouth College decision from the historical standpoint by Mr. Orton, a lawyer and economist of high standing. Mr. Orton will follow this shortly by another on the purely legal aspects and effects of the decision. Later we shall print from time to time further articles dealing with the Fourteenth Amendment and the attitude of the bar and the bench toward personal and property rights, thus presenting in the series a somewhat complete picture of the present status of democracy in the United States.—EDITOR.]

THE Dartmouth College case was essentially a personal and political controversy between comparatively small factions at an early day in one of the smaller States of the Union. But it has made law in regard to the most solemn and vital interests of a great nation and is still, in spite of strong efforts to evade its consequences, a mighty force in the economic and social institutions of the country. Probably its most striking results were never dreamed of by the scheming college trustees, the adroit and partisan counsel, or the justices of imperious will, when they were playing their evanescent rôles and giving rein to the political passions and prejudices of the hour.

Justice Cole, of the Iowa Supreme Court, said in 1874 that "the practical effect" of the Dartmouth College decision "is to exalt the rights of the few above those of the many," and that "under the authority of that decision more monopolies have been created and perpetuated, and more wrongs and outrages upon the people effected, than by any other single instrumentality of the Government."

President Hadley has expressed the opinion that this adjudication, taken with

the Fourteenth Amendment, has had the "fortuitous" effect of "placing the modern industrial corporation in an almost impregnable constitutional position."

The late George P. Wanty, of Michigan, afterward appointed Federal judge by President McKinley, said with reference to this decision: "No court may promulgate a doctrine which is not founded in the good sense of the people and have it respected."

What is there in this celebrated case to call forth such emphatic expressions of opinion from jurists and students of government? It is the purpose of this article to show briefly the results of the decision and the influences which brought it about. In the second article the case will be considered from the legal standpoint.

The result of the Dartmouth College decision has been the confusion of privilege with property. Being the basis of the doctrine that a few lawmakers, clothed with authority for a day, may barter away forever the sovereign rights and powers of the people, it has proved a prolific source of corruption in legislation. Among the fruits of this doctrine are such privileges as perpetual exemption from the common burden of taxa-

tion and never-ending possession of public highways by street railways and other corporations run for private profit.

It is true that the force of Marshall's decision has been greatly impaired by his successors. In 1895 Judge Wanty was moved to say that the most casual observer could not fail to see that its authority was "fast passing away." Yet this alien growth, engrafted upon the Constitution in 1819, soon assumed such huge proportions that its "passing" was not the work of a year or a decade. Chief Justices Taney and Waite hewed off mighty limbs, but the gnarled trunk still stands as one of the chief bulwarks of privilege.

The causes which produced the Dartmouth College decision have never been set forth in such form as to penetrate the public consciousness. It has been taken by many, along with the Declaration of Independence and the Constitution, as the work of the fathers of the republic, who, actuated by patriotism and guided by an almost divine inspiration, wrought only for the future weal of their country. In this instance the dream is rudely shattered by the pick and shovel of the historian. To understand this decision, we must dig down to its roots.

Dartmouth College was founded in 1769 by a charter granted by Governor Wentworth, of New Hampshire, in the name of the English king. Twelve trustees were named to have full control of the college, except that the first president was named in the charter and was to have the privilege of appointing his successor. The first president, Eleazer Wheelock, died in 1779, having appointed his son, John Wheelock, to succeed him. Some years before 1800, the Wheelock "dynasty" became distasteful to certain ruling spirits on the board of trustees, and in 1809 the president's enemies secured a majority of the board.

All parties to the trouble were originally Federalists, but Wheelock was a Presbyterian, while his opponents adhered to Congregationalism, then practically the established State Church in New Hampshire. In 1815 there came a war of pamphlets, with bitter charges and counter charges. Gradually the struggle assumed a political cast. Wheelock appealed to the Legislature to investigate and reform alleged abuses of manage-

ment. The Legislature, then a Federalist body, investigated the college thru a committee, but went out of office before positive action could be taken. The feeling between the factions had now become so intense that the trustees, without even waiting for the report of the investigating committee, removed President Wheelock from office. Thomas W. Thompson, a leading trustee and strongly hostile to Wheelock, was then the most prominent politician of the Federalist party in New Hampshire. The president's enemies being in possession of one party, his friends tended to become identified with the other; and in this movement they were joined by the opponents of the established Church. With these new elements of support, the anti-Federalists in 1816 elected William Plumer to the office of Governor, together with a friendly Legislature. The contest was very bitter, and before it ended, the identification of the Wheelock faction with anti-Federalism had become complete. The new Governor and Legislature passed acts amending the college charter, the principal changes being an increase of the number of trustees from twelve to twenty-one and the creation of a board of overseers having a veto on the more important acts of the trustees. The new trustees were to be appointed by the Governor and council, and then the board was to be self-perpetuating as before. One result of these legislative acts was the restoration of Wheelock to the position of president, with his friends in practical control of the institution. The old anti-Wheelock trustees largely contributed to this result by refusing to take any part in reorganizing the college under the new laws. Regarding the charter amendments as unconstitutional, they brought suit in the State court to test their validity. Until the final decision in 1819 the university, as the reorganized college was called, and the college, maintained by the old trustees as a separate institution, were rival seats of learning.

Daniel Webster, a graduate of the college, had been retained by President Wheelock about a year before the passage of the acts, but was persuaded by personal and political friends to abandon Wheelock. Later he appeared as chief counsel for the trustees. The acts were

attacked as being opposed to general principles of government, as contrary to various provisions of the New Hampshire constitution, and as in violation of the Federal Constitution in that they impaired the obligation of a contract contained in the college charter of 1769. The highest State court, then composed of three judges of exceptional ability, decided against the old trustees on every point, and the case was taken to the United States Supreme Court solely on the point pertaining to the Federal Constitution.

Senator Henry Cabot Lodge, in his biography of Webster, has summarized so clearly and forcibly the facts relating to the conduct of this case in the Supreme Court that I shall take the liberty of quoting from his work. Mr. Lodge speaks with authority, for he wrote this biography, as he tells us, only after he had "carefully examined all the literature, contemporary and posthumous, relating to Mr. Webster." Webster, when publishing his Supreme Court argument in the college case, had admitted that "something was left out." Referring to this, Mr. Lodge says:

"That something, which must have occupied in its delivery nearly an hour, was the most conspicuous example of the generalship by which Mr. Webster achieved victory, and which was wholly apart from his law. . . ."

"Mr. Webster was fully aware that he could rely, in any aspect of the case, upon the sympathy of Marshall and Washington (Associate Justice Bushrod Washington). He was equally certain of the unyielding opposition of Duvall and Todd; the other three judges, Johnson, Livingston and Story, were known to be adverse to the college, but were possible converts. The first point was to increase the sympathy of the Chief Justice to an eager and even passionate support. Mr. Webster knew the chord to strike, and he touched it with a master hand. This was the 'something left out,' of which we know the general drift, and we can easily imagine the effect."

How unfortunate that they did not have stenographers in the days of Webster and Marshall!

Mr. Lodge continues:

"In the midst of all the legal and constitutional arguments, relevant and irrelevant, even in the pathetic appeal which he used so well in behalf of his Alma Mater, Mr. Webster boldly and yet skilfully introduced the political view of the case. So delicately did he do it that an attentive listener did not realize that he was moving from the field of 'mere reason' into that of political passion. Here no man could equal him or help him, for here his eloquence

had full scope, and on this he relied to arouse Marshall, whom he thoroughly understood. In occasional sentences he pictured his beloved college under the wise rule of Federalists and the Church. He depicted the party assault that was made upon her. He showed the citadel of learning threatened with unholy invasion and falling helplessly into the hands of Jacobins and free-thinkers."

Of course, the Jacobins were the followers of Jefferson, and the free-thinkers were Governor Plumer and his supporters, who were then carrying on an unprecedented struggle for the legal equality of all religious denominations in New Hampshire. In the following year they were successful in depriving the Congregational Church of the tax-exemption privilege theretofore accorded to its clergy, and in actually enacting a law that no citizen should be compelled to contribute to any religious society "without his consent first had and obtained." History records that the supporters of these revolutionary measures were termed "infidels,—enemies of God and religion."

Mr. Lodge, speaking of Webster's address, proceeds:

"As the tide of his resistless and solemn eloquence, mingled with his masterly argument, flowed on, we can imagine how the great Chief Justice roused like an old warhorse at the sound of the trumpet. The words of the speaker carried him back to the early years of the century, when, in the full flush of manhood, at the head of his court, the last stronghold of Federalism, the last bulwark of sound government, he had faced the power of the triumphant Democrats. Once more it was Marshall against Jefferson—the judge against the President. Then he had preserved the ark of the Constitution. Then he had seen the angry waves of popular feeling breaking vainly at his feet. Now, in his old age, the conflict was revived. Jacobinism was raising its sacrilegious hand against the temples of learning, against the friends of order and good government. The joy of battle must have glowed once more in the old man's breast as he grasped anew his weapons and prepared with all the force of his indomitable will to raise yet another constitutional barrier across the path of his ancient enemies."

The most important decision of the century, with reference to private and public rights, was to be made as a "barrier" across the path of one old man's "ancient enemies."

Webster's biographer continues:

"We cannot but feel that Mr. Webster's lost passages, embodying this political appeal, did the work, and that the result was settled when the political passions of the Chief Justice were fairly aroused. Marshall would probably have

brought about the decision by the sole force of his imperious will. But Mr. Webster did a good deal of effective work after the arguments were all finished, and no account of the case would be complete without a glance at the famous peroration with which he concluded his speech and in which he boldly flung aside all vestige of legal reasoning, and spoke directly to the passions and emotions of his hearers."

Mr. Lodge quotes from a description of Webster's peroration by Professor Goodrich, an eye witness of the scene. Goodrich tells us that Webster, after finishing his legal argument, stood silent a few moments and then went on to speak personally of the college and to predict great disaster for all colleges and for the private rights of individuals if the legislative acts of New Hampshire should be upheld. While speaking in a personal way of his Alma Mater, he broke down and had to pause to compose himself. In "broken words of tenderness" he then went on to speak of his attachment to the college. Goodrich continues his description thus:

"The court room during these two or three minutes presented an extraordinary spectacle. Chief Justice Marshall, with his tall and gaunt figure bent over as if to catch the slightest whisper, the deep furrows of his cheek expanded with emotion and his eyes suffused with tears; Mr. Justice Washington, at his side, with his small and emaciated frame, and countenance more like marble than I ever saw on any other human being—leaning forward with an eager, troubled look; and the remainder of the court at the two extremities, pressing, as it were, to a single point, while the audience below were wrapping themselves round in closer folds beneath the bench, to catch every look and every movement of the speaker's face."

This peroration had been used by Webster four months before in the State court, with similar effect upon a sympathetic audience, but not upon the court, altho two of the three judges were graduates of Dartmouth. It is not recorded that they were moved to tears.

Mr. Lodge comments further on the part Webster played in this forensic contest:

"Great lawyer as he undoubtedly was, he felt on this occasion that he could not rely on legal argument and pure reason alone. Without appearing to go beyond the line of propriety, without indulging in a declamation unsuited to the place, he had to step outside of legal points and in a freer air, where he could use his keenest and strongest weapons, appeal to the court not as lawyers, but as men subject to passion, emotion and prejudice. This he did boldly, delicately, successfully, and thus he won his case."

In confirmation of Mr. Lodge's view of the matter, we may quote the opinion of Mr. Joseph P. Cotton, Jr., the editor of a recent edition of "The Constitutional Decisions of Marshall." In his comment on this case he says:

"The inference is unavoidable that in that hour he (Webster) argued, and the court listened, outside the record. There can be little question that, by the influence of counsel, by some subtle influence of politics or friendships, there seems to have crept into the consideration of the Dartmouth College case a distinct bias in favor of the college."

Webster devoted most of his legal argument to questions which, as he acknowledged, were not in any way before the court. The only point of which the Federal Supreme Court had jurisdiction was the alleged violation of the Federal Constitution with reference to impairing the obligation of contracts. To this point Webster devoted six pages of his published argument, as compared with thirty pages given to points on which the last judicial word had been spoken by the State court. Any modern court would have required him to speak only on the question of which the court had jurisdiction.

Even in the State court the plaintiffs had had a great advantage in the superior ability and astuteness of their counsel. In addition to Webster's wonderful powers as an advocate and orator, they had the services of Jeremiah Mason and Judge Jeremiah Smith, then leaders of the profession in New England. At Washington the defendant's interests were intrusted to John Holmes, of Maine, a scheming politician, who is said to have been a "noisy eulogist and reputed protégé of Jefferson," representing "in politics, law and statesmanship all that the soul of Marshall loathed." His argument occupied about three hours, and seems to have been a compound of legal misapprehension and ranting declamation. William Wirt, Monroe's brilliant Attorney-General, was employed to assist Holmes; but the case was not much benefited by his appearance, for he was not in harmony with his associate and was so overburdened with the duties of his office that he made practically no preparation on the case and presented a sorry spectacle in the argument. He was known to be the favorite adviser and confidant of Jefferson.

After the case had been argued at Washington, additional counsel was employed, on behalf of the State of New Hampshire, in the person of William Pinkney, of Maryland, then the recognized leader of the bar in the United States. Mr. Pinkney tried to obtain the privilege of rearguing the case, but it was too late; the Chief Justice would give him no opportunity for making the motion.

But even with the many advantages, fair and unfair, on the side of the plaintiffs, after the case was submitted to the court, a majority of the seven justices were not ready to say that the obligation of any contract, in the constitutional sense, had been impaired by the amendments to the college charter. On the following day the Chief Justice announced that the court could agree on nothing and the case would be continued for a year, until the next term. Mr. Lodge comments as follows:

"The fact probably was that Marshall found the judges five to two against the college, and that the task of bringing them into line was not a light one."

If Mr. Lodge is right, we have here established a novel rule of judicial procedure, namely, that when seven judges, after full argument, stand five to two in favor of one party, if a Chief Justice with an "imperious will" is one of the two, the proper course is to adjourn the case and bring the five "into line."

Mr. Lodge gives us some light on the getting "into line" process. He tells us how the batteries of the Federalist press, of printed pamphlets, letters and essays, which had already been brought into action for the college under the stress of party influence, were now trained upon the opposing side "with increased eagerness," in order to assist Marshall in his "task." The object, he says, was to "sway the judges without their being aware of it." The printed arguments of the plaintiffs' counsel and other documents "were carefully sent to certain of the judges, but not to all." With Story, whom Mr. Lodge describes as "a Democrat by circumstances, a Federalist by nature," the trustees "had little difficulty"; but "to reach Livingston and Johnson was not so easy, for they were out of New England, and it was necessary to go a long way round to get at them."

Mr. Lodge explains one of the circuitous ways pursued in order to reach these two judges. It lay thru Chancellor Kent, "the great legal upholder of Federalism in New York." Justice Livingston was from New York, and had sat on the same State bench with Kent, and Justice Johnson, of South Carolina, was a close friend of the Chancellor.

"Kent's first impression, like that of Story, was decidedly against the college, but after much effort on the part of the trustees and their able allies, Kent was converted, partly thru his reason, partly thru his Federalism."

Mr. Lodge says that "the whole business was managed like a quiet, decorous political campaign."

At the present time counsel who should, after the argument of a case, send any document "to certain of the judges, but not all," or who should submit any paper to the judges without giving it also to opposing counsel, would be courting proceedings for their disbarment; and any judge who could be "reached" by the imperceptible methods described by Mr. Lodge, without "being aware of it," would be considered fit only for the next world.

The quotations which have been made from Mr. Lodge with reference to the means used to bring about a decision favorable to the college are amply supported by known facts and documents, many of which have been industriously collected by Mr. John M. Shirley, who published in 1879 a history of "The Dartmouth College Causes." That Marshall's "imperious will" was a tremendous force in producing judicial results is well recognized. Sometimes he rendered a decision and entered judgment without taking the trouble to find out whether his view was supported by a majority of the judges, and in certain cases a minority thus dictated the action of the court. In the language of Professor James B. Thayer, in his Marshall Day address, the Chief Justice "was sometimes curiously regardless of conventions."

As to evidence of the "decorous political campaign," much of it has been destroyed, scattered or suppressed. Judge Smith's voluminous correspondence with Webster and other prominent actors in the struggle was destroyed by

him in 1824, and many of Thompson's letters went "to the paper mill." But a few letters have been left for the historian. Francis Brown, the new president of the college, went to Albany and had conferences with Chancellor Kent and Governor Clinton. The latter was one of the leading Federalists of the country and readily lent his aid against the followers of Plumer, who were especially antagonistic to him. In letters to Webster President Brown speaks of dining with Kent and discussing the college case and of learning that Justice Johnson had visited Kent and had talked of the case with him. Brown had discovered "from other sources" that Johnson had "requested the Chancellor's opinion." He suggests that Webster get Chief Justice Isaac Parker, of Massachusetts, to write to the Chancellor. He speaks of "the half secret and cautious manner" in which printed copies of Webster's argument had been distributed. On September 19, 1818, President Brown expressed the opinion, "New York and New England are gained," meaning that Story and Livingston had been reached. Mr. Shirley says that in August, 1818, copies of the arguments of plaintiffs' counsel were furnished by Webster to Justice Story, "to be distributed by him to a portion of the judges." At the reassembling of the Supreme Court, in February, 1819, about eleven months after the arguments, all were in line for the college except Justices Duvall and Todd. Duvall dissented without filing an opinion, and Todd was absent on account of illness.

The trustees of Dartmouth College did not carry on this politico-legal struggle because they feared any disastrous results to the college from a participation by the State in its control. While the amending statutes were under considera-

tion, three of the leading trustees, Thompson, Paine and McFarland, presented a memorial to the Legislature in which they said they would have no objection, and believed their fellow trustees would have no objection, "to the passage of a law connecting the Government of the State with that of the college, and creating every salutary check and restraint upon the official conduct of the trustees." They proposed a plan by which the higher State officials would constitute a board of overseers having an absolute veto on all acts of the trustees. As Mr. Shirley says:

"the trustees were willing that almost any amendment should be made to the charter, if so framed that they could exclude Wheelock and his friends from any share in the government of the college, and could retain possession for themselves and their friends."

There are those who consider the Dartmouth College decision as an important bulwark of property. Their error lies in the confusion of the idea of privilege with the idea of property. Privilege is the antithesis of property, a special favor, an exception to the rule of competition and the law of private property. It enables favored individuals and classes to levy tribute upon the property of others. When crystallized into law and made perpetual, a privilege may be capitalized and treated, in form, as property. It is property in the same sense in which the slaves were property.

Those who deplore the results of the Dartmouth College decision need not yield to any in their devotion to the principle of private property. That a man should enjoy the fruits of his own labor is a fundamental postulate of the human mind. Their objection to this decision is not that it supports the rights of property, but that it enables privilege to masquerade in the garments of property.

NEW YORK CITY.

On Tennyson's Centenary

BY WARREN BARTON BLAKE

THE August 7 issue of the *Collegiate Tennyson* (Vol. 1, No. 1) contains an article by Mr. Blake is a very timely criticism of the poet and his work. —*Book*

"According to the best of my recollection, when I was about eight years old I covered two sides of a slate with Thomsonian blank verse in praise of flowers for my brother Charles, who was a year older than I was, Thomson then being the only poet I knew."

ALFRED TENNYSON wrote this memorandum in the year 1890. It is said that he reeled off, as a boy, hundreds of lines such as these:

When the winds are east and violets blow
And slowly stalked the parson **crow**.

Thus early the young Tennyson became what Frederic Harrison called the matured man: poet of birds and flowers. Close observation, an almost myopic searching of the face of nature, were later to distinguish this exquisite among Victorian songsters. Rawnsley once asked Tennyson in which one of all his lines he took most pride. He said: "I think I am most glad to have written the line:

The mellow ouzle fluted in the elm."

"I believe," he added, "I was the first to describe the ouzle's note as a flute note." And when Ruskin criticised as a "pathetic fallacy" the lines in "Maud":

For her feet have touched the meadows,
And left the daisies rosy—

Tennyson was more than a little irate. The poet was asked "times out of mind" what he meant by these verses. "Any one with eyes could surely know how a lady's dress, brushing across the (English) daisies, tilts the heads and lets us see the rosy under-petals, but there are a greater number of no eyes than eyes in the world, the more the pity of it."

In my youth the growls!
In mine age the owls!
After death the ghouls!

Tennyson himself has put these lines into our mouth; and in our centenary studies of Tennyson we must avoid the danger of becoming ghouls of literature: critics of minutiae. For the poet, these minutiae are of an importance that he is hardly likely to exaggerate. But with the microscopic examination of single lines, and the changes made in them

(such as may be found in Professor Rolfe's and Professor Wells's recent letters to the *New York Nation*) the rank and file of poetry lovers have no preoccupation. It is enough that Tennyson was a painstaking craftsman—anxious always to be as accurate in his verse as are other writers in their prose; eager for perfection of harmony and for beauty of images. Sometimes his alterations were ill judged, as when from at least one edition of "The Charge of the Light Brigade" he excluded the key line of the whole poem:

Someone had blundered.

That he soon restored. In general, however, he was the sanest and the surest of his own critics. Few readers regret the omission from the "Works" of the stanzas that inordinately swell the two-volume "Memoir." Tennyson was a sound judge of his own excellence and defects. He realized his tendency toward piling on an embarrassment of riches; his excluding from the 1832 edition of "The Palace of Art" and from the subsequent editions several stanzas which seemed to him to confuse the picture he was drawing there, is but one of many prunings that he resorted to in correcting his pictorial exuberance. Often, but not once too often, he repeated the adage, "The artist is known by his self-limitation."

While to study the evolution of a poem may well be a fascinating exercise, rendered all the easier today by the publication of the Eversley Tennyson, by the Macmillan Company in six volumes, that exercise is, often enough, more academic than valuable for the light it throws on the poet's work. For Tennyson himself, many passages in Wordsworth and in other poets were spoiled by our modern fashion of printing all the variants along with the definitive text. In Tennyson's own case what is published as the final form is, often enough, the original version of the first manuscript; so that there is no possibility of really

tracing the history of what may seem to be a new word or a new passage." The poet's line in "Maud":

I will bury myself *in my books*, and the Devil
may pipe to his own,
was, after the first edition, altered to:

I will bury myself *in myself*, etc.,—
which was highly commended by the critics as an improvement upon the "original" reading; yet we know now that this last reading follows the first manuscript draft, that revision in this case was to be sought in the earlier edition, not in the final rendering. Giving us of his best, Tennyson would have wished that his best should remain without the appendage of variorum readings: "chips of the workshop" he called them.

In the Rev. H. D. Rawnsley's "Memoirs of the Tennysons" one may read that at Somersby Rawnsley found "a fine burly old fellow with dark, brown eyes and a smile that 'seem'd half within and half without, and full of dealings with the world.'" Here is a sample of the ensuing conversation:

"'You know we was all poor i' them daäys, baiked on cow-cassons, cow-muck rolled i' the sun, and ate moästlins barley bread . . .'

"'Barley bread,' said I.

"'Yees, a deäl of the wheät was niver sown or thowt of. It was amoäst all barley when I was a boy.'

"Here again was a hint of the Laureate's accuracy of local observation:

"'Only reapers, reaping early
In among the bearded barley.'

There is in all these glosses a good deal of what an American critic, writing of the poet himself, calls "this petty, prying, nature cult." A delightful chapter in Mrs. Gaskell's "Cranford" sets forth one aim of the "romantic nature poet" to such perfection that it will bear repeating once more, for it has already been cited by Mr. Paul E. More in the introduction to his collection of Byron's poems, that are conceived in a larger spirit. Who has forgotten the ladies' visit to old Mr. Holbrook, the bachelor, or that scene in the garden, where he quotes Tennyson and makes his own commentary as he proceeds:

"The cedar spreads his dark-green layers of shade." Capital term, layers! Wonderful man! Why, when I saw the review of his poems in *Blackwood*, I set off within an hour, and walked seven miles to Misselton

(for the horses were not in the way) and ordered them. Now what colour are ash-buds in March?"

"Is the man going mad? thought I. He is very like Don Quixote.

"'What colour are they, I say?' repeated he vehemently.

"'I am sure I don't know, sir,' I said, with the meekness of ignorance.

"'I knew you didn't. No more did I—an old fool that I am! till this young man comes and tells me. Black as ash-buds in March. And I've lived all my life in the country; more shame for me not to know. Black; they are jet-black, madam.'"

Our critic's comment is: "Excellent botany, no doubt, and very dainty verse, but I cannot think the fame of the great masters of song depends on such trivialities." Spared by the quickness of his common sense from aping Wordsworth's pretended simplicity of poetic diction, Tennyson was, all the same, heir to more than the post of poet laureate. He of "the dark green layers of shade" and the "ash-buds in the front of March" followed after the discoverer of the small celandine. Originality is not, indeed, the first merit one would claim for Tennyson. Just as his voice is less conspicuously his own than Browning's is Browning's, the individuality speaking out with less of self-assertion, it is, obviously enough, rather in combining familiar elements than in stirring with any new inspiration, that the poet excelled. An early critic of his first independent volume wrote that "we recognize the spirit of the age, but not the individual form of this or that writer." The echo is so complex that we cannot regard it as worth while to break it up into components. There was no conscious imitation; neither was a new note sounded. In the mastery of the lyrical instrument, in the studied breadth of his work and thruout its considerable extension, one finds evidences of beauty seen and beauty imaged forth rather than greatness of vision or of conception. Even in "In Memoriam" there is, for many a reader besides Mr. Harrison, a suggestion of academic aptitude rather than a breath of the topmost air of poetic rapture. The "broad Churchman" theology of "In Memoriam" Frederic Harrison has somewhat cruelly called "an admirably tuneful versification of ideas current in the religious and learned world," prin-

cipally, perhaps, in the world of Jowett and Maurice. Once more is musically phrased our vague, familiar sense of ignorance. In his reflective verse, Tennyson echoed more than he crystallized the thought of the age whose master bard he was. Burns, for whom Tennyson had so honest an enthusiasm, was more of an innovator; Wordsworth, before Tennyson, gave an impulse to the modern sense of communion with nature, tho perhaps Tennyson's poems were more influential in this direction than were those of his less popular predecessor.

Metrically, even, Tennyson was less original than he himself supposed. "As for the meter of 'In Memoriam,' he wrote; "I had no notion till 1880 that Lord Herbert of Cherbury had written his occasional verses in the same meter. I believed myself the originator of the meter until after 'In Memoriam' came out, when some one told me that Ben Jonson and Sir Philip Sidney had used it." When we turn the subjective side of Tennysonian verse we find that his was, in Faguet's recent phrase, "a romantic sensibility that sought expression in classical perfection," whatever that may mean. Even here Keats was his forerunner. Tennyson's art does doubtless show the keener feeling for detail, just as Sir Alfred Lyall has asserted. English "naturalism"—if one may use the word that Brandes applies to the romantic poets—had gone a step onward; whether upward need not presently concern us. M. Faguet has described Tennyson as "the rendezvous in one man of all the kinds of poetry that had sparkled in the generation before him. It was his temperament to feel very keenly what his predecessors had felt before him; it was his talent to give these sentiments new settings—tales and dreams and legends." Tennyson's real greatness is summed up by his own son, who has said:

"If I may venture to speak of his special influence over the world, my conclusion is that its main and enduring factors are his power of expression, the perfection of his workmanship, his strong common sense, the high purport of his life and work, his humility, and his open-hearted and helpful sympathy."

—The Tennysons and their world, p. 171.

Whatever its "enduring factors," the genuineness of Tennyson's preëminence

in his age remains indisputable. In the "English Men of Letters" biography one may read that "Tennyson's popularity grew so steadily and spread so widely for nearly sixty years, and his influence over his generation has been so remarkable, that his finest poetry may undoubtedly be treated as an illustrative record of the prevailing spirit, of the temperament, and to some degree of the national character of his period." Poe was not born too soon to ignore the spell of the other's music; and Tennyson lived on almost to yesterday. He was born in the second decade before George Meredith; he lived to see the ripening of Swinburne's genius—Swinburne, whom he had entertained at dinner, fresh from college, and whom he had highly approved for not pressing on him verses of his own. Long was the laureate's reign.

Nor need we fear exaggerating the part the personal equation played in conditioning the poet's popularity. His married life was so loyal, and his love for wife and home and children was so true; his patriotism as an Englishman was so intense, and he *was* so English, notwithstanding those Rembrandt locks of his and that gypsy head. There is in all the portraits—penned or painted—a ready-made nobility by which the poet could not fail to profit. And seldom has one been described so often and so effectively. Edward FitzGerald, asked by a friend to tell something of Tennyson's college days, wrote that his intimacy with his fellow poet scarcely began at Cambridge, tho he remembered him well enough: "a sort of Hyperion." It was a wonderful circle that Tennyson moved in at Trinity; many of the friends there were already free of FitzGerald's fellowship. Spedding the Baconist; Milnes (later Lord Houghton), Trench, Alford, Brookfield and Thackeray, Blakesley and John Kemble and Tennant—above all, Arthur Hallam. The present Lord Tennyson records the fact that Alfred Tennyson was often asked, in certain college rooms, "to declaim the many ballads that he knew by heart . . . and also his own poems." FitzGerald tells us that "Cynthia" was one of the poems that he used to repeat "in a way not to be forgotten at Cambridge tables." The six-foot

Tennyson of Cambridge times, broad-chested, strong-limbed, his forehead ample, his head finely poised, was himself a figure "not to be forgotten." Many an observer was struck by the union of strength and refinement that Tennyson's physique suggested. Carlyle's sketch of the poet, drawn, later on, for Emerson's benefit, tells us something of the circumstances of the man as well as of his appearance. "He had his breeding at Cambridge," Carlyle wrote, "as if for the law or church; being master of a small annuity on his father's decease, he preferred clubbing with his mother and some sisters to live unpromoted and to write poems. In this way he lived still, now here, now there, the family always within reach of London, never in it; he himself making rare and brief visits, lodging in some old comrade's rooms. . . . I do not meet in these last decades such company over a pipe! We shall see what he will grow to."

Such was he who swam, outwardly and inwardly, "in an articulate element as of tranquil chaos and tobacco smoke." A hearty man, this poet; he went in for plentiful salt pork and new potatoes, saying: "All fine natured men know what is good to eat." Every one remembers "Will Waterproof; Made at the Cock":

Head-waiter of the chop-house here,
To which I most resort,
I too must part: I hold thee dear
For this good pint of port,

but it is only Edward FitzGerald who records the fact that "the plump landlord" was offended when told of the poem. "'Had Mr. Tennyson dined oftener there, he would not have minded it so much,' he said." Tennyson was, none the less, a doughty trencherman. It merely happened that he preferred—outside of verse—another eating place. Bertholini's was the place of his predilection; and the prices were not high. Bertholini's was in Leicester Square; what matter if wags called it "*Dirtolini's*?" Women loved the poet for the romantic figure that he cut; men liked his love of humorous stories, his perpetual smoking (like some ill regulated chimney), his big way of doing little things. Tennyson drank his tea in a bowl; "a tea cup is such a niggardly allowance," was his saying.

And some of us honor the man's memory, not for any one of all these reasons, but simply for the poetry that he wrote.

The fact that the poet's work does not naturally break up into a succession of manners, that he soon "found himself," and thereafter pursued the even tenor of his way without developing his powers in unexpected directions, does somewhat simplify the problem of his work. And yet a systematic "analysis" of that work is here quite out of question. It is almost enough to have said that from first to last he sought purely English inspirations for his work, or delved, not too deeply, into the storehouse of Greek myth and fable. As decade followed decade, as the independent and somewhat vegetative poet of Somersby blossomed out as Poet Laureate (and the national favorite, too), a greater proportion of his verse took on an occasional character; some of it was as journalistic and as transitory (though never quite as flat) as Mr. Kipling's at his least inspired. "The Princess," all inlaid as it is with beautiful lyrics, is scarcely more than a piece of that "higher journalism" we read of and seldom meet with. "Maud," many of us hold, was the last of the longer poems that really "mattered." As for the dramas, if we read them at all in the years to come, it will be only because Dr. Eliot has for some reason placed "Becket" on his five-foot shelf. The plays have no longer an Irving to produce them; and they demonstrate little enough, it seems to me, beyond the circumstance that the poet's genius was far more descriptive than dramatic.

"Descriptive," or "pictorial," as Tennyson always was, in his "Idylls of the King" he comes near to being poster-like. I would not compete with the boys and girls who are writing entrance examination essays on Arthur as the Type of Conscience, or on King Arthur and Prince Albert; nor dare I write of the Table Round, fearing lest I plagiarize from some future critic—now trying the Columbia "exams"—who has drawn a character sketch comparing Launcelot and the Northern Farmer, "Old Style." The "Idylls" are known to every copy issued in our American edition of Macaulay's schoolboy. That were dis-

function enough and to spare for any book of verse.

And these same "Idylls" come near to epitomizing the meaning and message of the writer whose birth is memorialized in this year of centenaries. If Tennyson holds among the poets much the position that a great illustrator holds among painters, the word need not be spoken in disparagement. We request only that we be not asked to accept Tennyson as a "poet of ideas." We have need of the illustrator—we have need of Tennyson. These men squarely oppose themselves to the introspection that bids fair to become characteristic of our art and letters. Something of the same importance that attaches to Delacroix in nineteenth century painting belongs, I am tempted to think, to the Victorian romancer. (For he is essentially a romancer, tho he happened to choose verse as his medium. A romancer he was who painted the glint of lances and the glister of spurs; the rich caparisons of steeds and their arched necks; the bravery of women's habiliments and the whiteness of their arms.) What does it matter that, for the moment, your romancers who deal in terms of paint and poetry are under an eclipse? Let the philosophers have their innings, and those who study sunlight effects. The color, the movement, the light and shade of chiv-

alry, all these things Tennyson had the sense of; and he has molded his material into verse whose grace often conceals its slightness of invention—its banality of sentiment. It is not the Middle Ages that his "Idylls" bring us; the original after which he copied (for he drew after Malory, not Nature) give us that. The reader of the "Scottish Novels" was more than ready for the "Idylls," just as the schoolboy is today. There is the same glamour, the same picturesqueness after the antique, the same documentation that closes our eyes to the same factitiousness.

Nor are we ungrateful. Tennyson the boy wrote Thomsonian blank verse in praise of the flowers, "Thomson then being the only poet I knew." To how many of us was not Tennyson the first poet whose images were seen by our eyes, just opening to poetry? Rising, then, on his winged fancies, we have been carried above this world of pettiness until we have grasped at airier conceits; until we have heard music sublimer and seen even purer visions. Tennyson has taught two generations, as they have stood on the threshold, that poetry may be enjoyed as well as read and learned by rote.

*Only to the pine-tree stretch'd out beneath
the pine.*

The Miracles of Every Day

O LEARNED in Nature's laws, you scorn,
O friend with Science wed, you grieve,
That I should sing on Easter morn
And offer prayers at Christmas Eve.
For angels are the mystic's dream
And God-in-Man a lie, you say:
And yet to me as wondrous seem
The miracles of every day.

I saw the bird break thru his shell,
The flower blossom, true to seed
The planet yield to tidal spell,
The carbon stored 'gainst human need
How species rose thru choice and change,
How Love grew strong in loss and strife—
Oh Bethlehem is not more strange
Than miracles of common life!

Strange is the rule of law, and stern
The mysteries that baffle quest:
How stern and strange from thee I learn
Fair boy of mine at Annie's breast
What sacred groves, what living streams,
O Spirit, marked thy wondrous way?
Oh Calvary no stranger seems
Than miracles of every day.

O firm in faith and learned in creed,
You marvel that I doubt and fear,
Content with strength for daily needs,
Nor seek to prove these problems here
Yet let me serve with heart and hand,
Where Love and Duty meet the way—
I cannot even understand
The miracles of every day!

PORTLAND, ORE.

The American Commissioners in Liberia

BY EMMETT J. SCOTT

[Mr. Scott, secretary to Booker T. Washington, is the negro member of the Commission of the United States to Liberia, which has just returned from its investigation of that country, but has not made public its report. Manifestly Mr. Scott cannot go into political details for the present. For a full discussion of the present Liberian situation and the duty of the United States in the premises see the editorial in our issue of July 29, entitled "Liberia's Crisis."—EDITOR.]

MUCH has been written about the little negro republic of Liberia, Africa, since the visit of the Liberian Envoys to this country a year ago. The Envoys came to America to invoke the good offices of the United States in the effort of the republic to preserve its independence and to strengthen the internal organization of the Government.

It was in response to the visit of these Envoys that the United States Government last spring sent a commission to Liberia to investigate conditions there and to report how this country can best serve the republic in the present exigency.

As an indication that the people of the United States share to some extent the interest of the colored people of the United States in Liberia let me say something, first of all, in regard to the commission that was appointed to investigate the affairs of the negro republic.

Shortly after his inauguration Mr. Taft and Secretary Knox appointed a committee of three members composed of Dr. Roland Post Falkner, of the United States Immigration Commission, chairman; Dr. George Sale, superintendent of schools of the American Baptist Home Mission Society, and the writer of this article, as members of the commission. Associated with these three members of the commission were Mr. George A.

Finch, of the State Department, as secretary; Major Percy M. Ashburn, United States Medical Corps, medical attaché; Captain Sydney A. Cloman, of the American Embassy of London, military attaché, and Mr. Frank A. Flower, civilian attaché.

It had been at first intended that the colored member of the commission should be Principal Booker T. Washington, of the Tuskegee Institute in Alabama. After it was found, to his own regret, as well as that of the State Department, that it would be impossible for him to leave his duties in this country for so long a time, I was appointed in his place, probably because I had for a number of years been his secretary and assistant at Tuskegee.

The United States scout cruisers "Chester" and "Birmingham" were placed at the disposal of the commission, which sailed from New York on Saturday, April 24. There was, for me at least, since I had never crossed the ocean before, much of interest on board ship during the two weeks that it took us to reach Monrovia, which is the capital and principal port of Liberia. Perhaps I ought to say here, in view of certain sensational statements which appeared in certain newspapers on the eve of sailing, that Captain H. B. Wilson, who was in command of the

"Chester," and Captain Howard, of the "Birmingham," did everything in their power to make pleasant my stay on board ship. Personally I cannot too warmly commend the treatment which I received at their hands, and at the hands of the officers and crews of both ships upon which, at various times during my absence from the country, I had the privilege of traveling. Captain Wilson especially, with the courtesy of a true gentleman, did everything in his power to relieve me of any embarrassment I might otherwise have felt in view of the reports that had been circulated.

I had never before, of course, been on board a Government vessel for such a trip, and the various regulations which are enforced upon shipboard were a constant source of interest to me. The matter of precedence among the officers and members of the crew particularly impressed me. On board the "Chester" the commissioners, it seemed, ranked with the captain, and they alone had their meals with him in the captain's mess cabin. The captain's cabin is a very sacred place on board a naval vessel. I noticed, for example, that no officer at any time admitted himself to the captain's presence without first receiving permission thru an orderly. I used to wonder secretly if the captain did not get a little lonesome sometimes, shut off as he seemed to be by reason of his rank from free and intimate intercourse with the other members of the crew.

We reached Monrovia on Saturday, May 8, exactly two weeks to the hour from the time we had passed Sandy Hook. These two weeks on board ship had given the members of the commission a very lively desire to get on land. We had abundant opportunities to talk things over during the time that we were on the ocean, and we were eager to see how nearly conditions would square with our preconceived notions. For my part I was particularly eager to see what a native African would look like in his own country.

It was a very curious experience as we began to approach land to see the natives coming out in their little "bum-boats" to sell their petty merchandise. Some of them had food for the mess table, others came out merely to dive for

pennies. One of the most interesting of these divers was a little fellow, a native Liberian boy, about eleven years old, black as ebony, with white, shiny teeth, who shouted from his little canoe: "Fro penny, fro penny, me dive, me dive: me name Booker, me name Booker Washington."

We cheerfully responded by pitching some pennies to see this artful diver catch them before they could reach the bottom.

After a few moments the American Minister, Dr. Ernest Lyon, came aboard, accompanied by Bishop I. B. Scott, of the Methodist Episcopal Church of America. Others of the party to greet us were the secretary of the American Legation and Edgar Allan Forbes, a newspaper and magazine writer, who was representing the Associated Press in Liberia.

After exchanging salutations the party prepared to go ashore. We learned that the people were prepared to extend a formal welcome to the visiting commission.

There were some formalities which had to be observed, however, before this was possible. The "Chester" thundered a salute of twenty-one guns, which was quickly answered by the Monrovia fort. Forthwith the sea front was lined with a countless number of people, who came down to get, some of them, at least, their first view of an American man-of-war. The Liberian Government sent out a highly decorated steam launch, the "President Benson," named after a former President of the republic, beautifully draped with signal flags and flying the American and Liberian colors; this launch conveyed the members of the commission to the dock.

Upon arriving there it was with difficulty that we could make our way thru the surging crowd which lined our pathway. Immediately after passing thru the custom house, the Acting Mayor, who was accompanied by the City Council, read to the commission an address of welcome, after which, preceded by a band of four companies of the Liberian militia, we marched up the streets and were successively stopped at four flower-decked arches prepared by the women of the republic, these arches representing

the four counties of Montserrado, Grand Bassa, Sinoe and Maryland, and as we passed under them addresses of welcome were read on behalf of each of said counties. Each one of these arches was in turn held over us until we reached the next, until we finally stopped at the American Legation, where an informal reception was held.

It was my privilege to reply to two of these addresses of welcome. I have never seen, even among the members of my race in the South, in their moments of wildest rejoicing, anything to exceed the feeling manifested by these people in their expressions of gratitude and good will to the American Government and the commission which had come to them as its representatives. One old woman exclaimed: "Welcome home; welcome home; welcome home; all of you." This was especially amusing to the white members of the commission, who had never before set foot upon their "Fatherland."

It was interesting to note during all the time we were in the country how closely these people regarded themselves as being connected with the United States. In all of the addresses, of one kind or another, it was constantly kept before the commission that it was America that was responsible for the settlement and auspicious beginning of the Liberian Republic. After this statement had been repeated in different forms a number of times, one of the commissioners, in replying to this sentiment so frequently expressed, facetiously remarked:

"In the Southern States of America the colored people are constantly reminding the white people of the United States that they owe a great debt to the negro race because they brought them as slaves from Africa to America. Here in Liberia, on the contrary, we are constantly reminded of the debt which America owes by reason of the transportation of American negroes to African soil."

There was no concealment, on the part of the Liberians, as to their governmental difficulties and their anxious desire for the aid which it seems only the American people can give.

On this subject it may be of general interest to quote the expressions of the *Liberian Register*, which is a sort of offi-

cial gazette. The *Register* in an issue published during the presence of the American commission in Liberia said:

1. The people of Liberia wish the United States, or capitalists of that country, to take over our public debt. It is not very large and we believe that if refunded at a very reasonable rate of interest and on terms that are fair to our creditors and just to ourselves, the debt can be easily managed.

2. They desire the United States to supervise our fiscal affairs and see to the collection of our customs, etc., providing men to do so who are especially experienced in this class of work. This is intended not only to train our young men who may be employed in the financial department of the Government; but to assure those who may come to our rescue in the payment of the debt that we mean to protect them in every way possible.

3. The people feel that there are some other departments of the Government which need reorganization and strengthening, namely: the military, interior, postal, educational, agricultural and judicial, by the new and possibly more modern methods that experienced men from the United States would doubtless introduce. They realize that the Government may not be financially able to employ all of such men that we may need, but a few must be secured if substantial progress is to be made.

4. In the fourth and last place, our little republic has lost so much territory in the adjustments of her boundary from time to time that our people would like, if possible, to come to some such agreement with the United States as will secure the presence of at least one of her representatives on all such occasions to assist in guarding the interests of Liberia. And, further, we desire to say that the Liberian people in making these requests are not prompted by either the thought or wish that the United States may go to war to protect their rights. They anticipate no such contingency. They want no war, there will be no war; the tendency of the times is not in that direction. Liberia needs far more the friendly advice of some capable and unselfish power that will stand by to advise and direct her in all legitimate efforts to help herself. She realizes the necessity for reforms along a number of different lines for interior development and for direction and assistance in utilizing not only the varied products of her virgin forests, but the boundless stores of mineral wealth locked up within almost every hill and vale of the counties of the republic.

As an American negro, I naturally have some pride in noting how far the Liberians have been able to preserve an orderly form of government. The affairs of San Domingo are now administered by officials appointed by the United States; Haiti and Liberia alone are the republics whose affairs are largely, if not wholly, administered by black men. In all of the great continent of Africa, with

its thousands and thousands of square miles of territory, Liberia, with the possible exception of Abyssinia, is the only state which is conducted by Africans for Africans.

The first sight of Monrovia is rather disappointing. In coming up from the dock you pass first through a particularly dilapidated street, called Waterside, which is, in a way, the commercial street of the city. Most of the business on this street is controlled by aliens—that is, by Europeans—and there is nothing at all attractive in this first view of the little city. As you ascend the hill, however, you see that the town is beautifully situated on a cape projecting far into the water, and surmounting the hill is a lighthouse whose warning and beckoning rays can be seen twenty miles at sea. The streets are wide, and the houses are, in the main, two-story brick structures and patterned on the order of the Southern mansions of our country, with wide verandas extending all the way around the house.

I had read much, before going to Africa, in Sir Harry Johnson's book on Liberia and in other publications, of the native Africans. It was to me, however, a very interesting sight to see representatives of the various tribes, including the Kroos, the Vais, the Golahs, the Mandingos, the Mendis and the Passeys, all of whom, in their varicolored costumes of dress and undress, followed us about the city. These natives manifested, it seemed to me, quite as much interest in the proceedings as the more intelligent and more highly civilized Liberians. They seemed also fully to understand the object and significance of the commission's visit.

The Americo-Liberians looked, for all the world, like the ordinary type of the colored people of the United States, and one would not imagine himself in Africa except for the appearance of the natives, who, with their loosely worn and highly colored costumes, greeted us on all sides. Tho indicative of that highly developed self-respect which characterizes Liberians, it was a rather strange sight for me to see the more important men dressed invariably in long, somber, black frock coats, with corresponding high silk hats. It seemed to me that under the merciless

rays of a tropical sun a more comfortable costume might be adopted. This garb, however, is the sign-manual of respectability and is a long-established custom which it would be difficult to change.

The commission used its time in interviews with the President of the republic, the Vice-President, the Secretary of State, the Secretary of War, the Secretary of the Treasury, the Attorney-General, judges of the Supreme Court, the bishops in charge of missionary work in Liberia, city and county officials, consular representatives, as well as the representatives of the large trading establishments doing business in the republic. A mere list of the names of the various officials and governmental departments of Liberia reveals how closely the Liberians have modeled their form of government and methods of administration after our own country.

Judging from repeated expressions of various Liberians and the official organ published at Monrovia, Liberia feels that America has failed to exercise that friendly interest in her existence and development which her sixty years of struggle and actual progress would seem to merit at the hands of a parent republic.

The commission did not confine its inquiries to Liberia alone; it chartered a boat and made visits to the agricultural settlements up the St. Paul River. Afterward, dividing—one section going on the "Chester" and the other on the "Birmingham"—the commission visited the interior districts, where there are differences between the Liberians and the British, and where there are differences between the Liberians and the French; the party going south visited Grand Bassa, perhaps the principal commercial port on the Liberian coast, and made visits to the towns of Upper Buchanan, Lower Buchanan and Edina.

Farther down the coast, at Cape Palmas, the town of Harper was visited and the party went overland to the mouth of the Cavalley River, where a canoe was secured for a visit up the river to some of the smaller villages. The only launch on the river, owned by a German firm, could not be secured because for five or six days it had been out of coal and there was no immediate prospect of a supply

of fuel being secured. As we journeyed up the river we stopped at some of the smaller villages, and in the interior there was the same general enthusiasm wherever the commission made a visit; cannon boomed, the militia was called out, bands paraded, and eager crowds of natives, gaudily clad, followed us about, and with many of them we had the pleasure of conversing thru an interpreter; the natives danced in our honor—the natives are always dancing—and gave many other outward evidences of their desire to extend to the American commissioners a hearty and royal welcome.

Leaving Liberia, the two parties reassembled and visited for two days in Freetown, Sierra Leone, where opportunity was afforded for comparison between that place and Liberia. The English exercise a protectorate over Sierra Leone and have spent considerable sums of money in providing improvements, the like of which are sadly lacking in Liberia, where there is no railroad, no telegraph system, no banking facilities or means of communications except by water or overland in hammocks, if the traveler be unable to trust his own legs.

The particular impression I have is

that Liberians need more contact with the outside world. To my mind, the negro citizens of the United States owe their great progress since emancipation to their contact with a stronger people. In fear of losing their independence, Liberians have not encouraged much contact with Europeans, who are, at this time, practically the only class with whom they come in touch.

The general good order to be found in the cities and in the agricultural settlements, the lack of profanity on the streets (the current language of the Liberians being the same as that of our own country), the unquestioned chastity of the women of Liberia, the respect for law and those who administer the affairs of their Government, together with their general reverence for religion, show that the Liberians are not without sterling virtues.

In Freetown, Sierra Leone, it is very evident that there are agencies of civilization at work which are not to be found in Monrovia, and it is their desire to possess such agencies of civilization that led the Liberians to make their appeal to the Government of the United States for help at this time.

TUSKEGEE, ALA.

A Legend of the Madonna

BY CLARENCE URMY

Out of holy Bethlehem
Into Egypt flying,
Herod's hate pursuing them,
Dangers multiplying,
Hastened thru the country wild
Joseph, Mary and The Child.

When some distance they had passed,
Worn and weary growing,
Came they to a field at last
Where a man was sowing
Seed of corn in fertile ground—
Mary's heart gave sudden bound,

To the husbandman she said:
"If men bid you aid them,
Asking if this way we fled,
With your tongue persuade them,
Saying: 'Yes, they passed at morn
On the day I sowed this corn.'"

Then, a miracle, behold!
While the man was sleeping,
All the field was turned to gold
Ready for the reaping,
Stalk and blade and ear were there
Gleaming in the sunlit air!

Came the men by Herod sent,
Spied the man, and roughly
Riding thru the corn, they went,
Calling to him gruffly:
"Has an old man passed this way
With a wife and child?" "Come, say?"

And the man, overwhelmed with awe,
Viewed his field and wondered . . .
"Yes," he said, "those three I saw."
"How long since?" they thundered—
"When I sowed this corn"—and then
Homeward rode King Herod's men.

SAN JOSE, CAL.

Ultramicroscopes and Ultramicroscopical Objects

BY A. COTTON AND H. MOUTON

[M. Cotton was born at Béziers and M. Mouton at Carcassonne, both important cities in the same year, 1869. They met for the first time in 1887, when both entered the famous Paris Superior Normal School, and since that date have always been the closest friends, socially and scientifically. After taking his doctor's degree, M. Cotton became professor at Toulouse University, and, later, filled the chair of physics at the Superior Normal School. M. Mouton began his scientific career at the Paris Natural History Museum, whence he also joined the faculty of the Normal School. In the year 1903 the two friends began working together on questions relating to ultramicroscopical bodies and they have always continued their scientific collaboration. They are both members of the Pasteur Institute.—EDITOR.]

OF all our senses, seeing gives us the most extensive knowledge, and we have the greatest confidence in what we have learned by the eye; consequently, when we try to increase our perceptions by the aid of instruments, we pay especial attention to those that enable us to *see* new objects. Hence it is that the telescope on the one hand, and the microscope on the other are, perhaps, the instruments most familiar to those who do not frequent the laboratory. The microscope in particular owes a large number of its improvements to the constant desire of makers to satisfy their public, which is made up not only of regular scientists but also of amateur scientists. In some cases the latter have been found more exacting than the former. Thus, these amateur students of nature wished to study the marks and ornaments on the shells of the diatomaceæ. Scientifically, this work was of no great importance, either practical or philosophical, and its only reward was the vanquishing of a difficulty. But from a mechanical point of view, it was of real use, for it called for still greater improvements in the microscope, which improvements have been utilized by the regular scientists in more than one field.

But, notwithstanding all the care taken by the manufacturers of microscopes, the result obtained is limited. It is true that greater magnifying power might be attained, but this is without real interest, for the ideal microscope would be the one in which each point in the object under view would be imaged forth by a point of inappreciable dimensions. But what really happens is this: Even in

the best instrument, the image of a point is always a small spot whose dimensions increase with the increase of the magnifying power of the instrument, so that when two points are too near one another in the object under examination, their images lap over one another a little and the eye is no longer able to separate them. The smallest resolvable distance, tho this depends somewhat on the nature of the object that is under examination, is never less than a quarter of a thousandth of a millimeter, even when the very best instruments are used. The explanation of this limitation of the powers of the microscope has been found in the nature of light itself. Considering light to be a result of vibratory motion and taking into account the phenomena of diffraction which is peculiar to the microscope as to all optical instruments, we can calculate the diameter of the spot forming the image of a point and show that this diameter will be smaller, if, in the first place, the cone of rays, which the instrument receives from the point under consideration, is more open, and, in the second place, if this point is placed in a medium of higher index and sends out rays of shorter wave-length, viz., nearer the violet in the spectrum, if we consider only visible rays. But with the instruments now in use, permitting homogeneous immersion and great numerical aperture we may say that the limit assigned theoretically to the resolving power of the microscope has been practically reached. We may hope, however, to extend it a little further by employing ultra-violet light, to which, tho the eye is not sensitive, the photographic

plate is sensitive. Yet, even by this method, we can hardly hope to do more than double the resolving power of the apparatus and this only after surmounting great technical difficulties.

But the ultramicroscope makes it possible to study much smaller objects than could be studied in the old way, these objects in certain exceptional cases having the millionth part of a millimeter. There is no contradiction between this statement and the one made a few paragraphs above, for this problem differs entirely from the one previously stated. That one was the distinguishing from one another points set very closely together, or, which comes to the same thing, determining the form of a very small detail. But we refer now to ascertaining the existence, in a homogeneous medium, of extremely small objects which are far enough apart so that their pictures do not lap over one another.

It may be asked how the presence of ultramicroscopic objects are revealed in a homogeneous medium. The answer is by using with great care a method employed by amateurs of the microscope, often in a rather imperfect manner, but with good results. We refer to the lighting up of a dark background. Consequently, an ultramicroscope is not a microscope whose optical parts have been improved, but an instrument provided with a special mode of lighting. The rules to be observed in this lighting have been laid down by Siedentopf and Zsigmondy, who were the first to make known this method to the scientific world. Light must be thrown as intensely as possible on the little objects which are to be studied. They then appear luminous and can therefore be observed if care has been taken to place the apparatus in such a position that no luminous ray of the lighting shaft can penetrate into the object-glass. • The particles then appear luminous on the absolutely black field of the microscope; in fact, they are made visible just as are particles of dust when a ray of sunshine penetrates a dark room.

Siedentopf and Zsigmondy themselves made their first apparatus for the observation of ultramicroscopic objects, by whose use a convergent horizontal ray

of light brightens under the microscope a very thin layer of the body that is being examined. Since then, a somewhat different plan has been adopted by us. We introduce a ray of light very obliquely under the body which is being examined, and the ray is then wholly reflected on the upper surface, and we thus prevent any direct rays from penetrating into the apparatus. Recently, Siedentopf has invented still another kind of apparatus and other scientists have done the same. Each of these inventions has certain advantages and certain faults, and it is best to use one or the other according to circumstances.

Now a word about the lighting of an ultramicroscope. You get the brightest and cheapest light by utilizing ordinary sunlight. This gives a wonderful aspect to the object under view and enables the observer to distinguish very minute particles which would not come out with any other sort of light. But this source of light is unfortunately too inconstant, and you are apt to use an electric arc, if one is at hand, and if you are not trying to determine the presence of exceedingly small objects. It is not necessary to make use of a too powerful arc provided the rays strike squarely the preparation, that is, the body under examination; for the light emitted by the little objects which you perceive depends on the brilliancy of the source of the light, this brilliancy being the same for all arcs, and not on the total intensity of this light. In the vast majority of our experiments we have always used an arc of only three amperes, which can be bought at a reasonable price.

When you examine a transparent body containing little ultramicroscopical objects, you are reminded of the starry heavens when seen thru a telescope. If you examine certain glasses colored by traces of metal, gold or silver, for instance, you perceive on the dark background of the field a mass of brilliant star-like objects, the reflection of the small metallic particles. These reflections differ in their brilliancy, the most brilliant ones being the reflections of the larger particles. Their appearance is all the more beautiful from the fact that they are not all of the same color. By examining in this way the colors of cer-

tain natural crystal—particularly those of crystallized salt which are sometimes pink or white—one has been able to prove that this coloration is due to small ultramicroscopical crystals lodged in the finest fissures of the crystal and which we have reason to believe are formed by metallic sodium. This is rather a surprising fact if we remember that this substance is so easily oxidized that it is found nowhere else in a metallic state and that its preparation and conservation have long been considered by chemists as a very difficult problem.

If instead of a solid body, we examine a liquid holding little ultramicroscopical bodies in suspension, the same phenomenon is still more striking. But in this case the brilliant points are all animated by the "Brownian movement," which affects all small particles, even when they are but microscopic and are held in suspension in a liquid. But in this particular instance, this constant agitation sometimes becomes extraordinarily animated, the whole field of the microscope being marked by a sort of general swarming, often accompanied, in the case of the most brilliant particles, by scintillations, when the luminous points change color, are extinguished and then reilluminated by turns. One may enjoy this really admirable sight by employing for the experiment a very diluted solution of colloidal silver sold under the name of argyrol. Or one may examine one of those pretty "solutions" of gold, red or blue in color, easily prepared by reducing with a drop of formol a trace of gold chloride in some very pure water containing a little sodium carbonate. Under the most favorable conditions of light—sunshine at noon in July—and observation, you can discover in such liquids metallic particles whose average diameters have been estimated to have a minimum size of one sixth millionth of a millimeter! Under less advantageous conditions, and especially when the little bodies which are being observed have not the optical qualities peculiar to metals you cannot of course expect to see anything except where the particles are considerably larger than this and yet far smaller than those seen in the ordinary microscope.

Ultramicroscopes have so far been used in very different sorts of research

work, but the most important results have been obtained where colloidal liquids were experimented with. These liquids play a very important part in chemistry and in biology, especially; and thanks to the ultramicroscope, we now know for certain that colloidal bodies are not really dissolved in their "solutions," but remain there in a state of stable suspension. It has not been possible in every case to observe the little particles of these bodies, but we have good ground for believing that even the colloids which it has not been possible to resolve have a discontinuous structure like the other ones. This special state of the colloidal group helps to explain their particular properties, which have long been under observation, as, for instance, their coagulation and their electric transformation, this last phenomenon being especially observable thru the ultramicroscope.

In a recent work—"Ultramicroscopes and Ultramicroscopical Bodies," Paris: Masson—we have given the results of our experiments in this field and have also tried to show how one can get at the composition and structure of colloids by combining our conclusions with those obtained by other students in this same branch of scientific work. Among the recent contributions to this problem, we have found especially useful those of Malfitano and J. Duclaux, who, by separating in certain cases ultramicroscopical bodies from the medium in which they are bathed, have been able to give us some idea of their composition. We are now led to consider these particles to be "granules" charged with electricity and englobed in a zone of matter carrying charges which are equal but of differing sign, the whole forming an electrically neutral micella.

Not a few biologists have employed the ultramicroscope for the study of living things. By this means they have been able in some cases to follow the movements which take place in the interior of vegetable cellules thru the displacement of the little bodies which they contain and which appear as luminous points. It has also been possible to make more apparent in their living state certain microorganisms existing in water or humors. With this apparatus it is

possible even to see very easily a microbe, in pleuropneumonia of oxen, for instance, whose dimensions are a little inferior to the limit of vision. The difficulties lying in the way of determining the form of ultramicroscopical objects has made it impossible up to the present to use the ultramicroscope in the discovery of numerous pathogenic microbes whose dimensions are inferior to those which can be seen under present lighting methods. It is much to be hoped that in some way we may be able to determine the specific optical character of these va-

rious small beings, some of which are the causes of terrible diseases.

We have just seen that the greatest service which, up to the present, has been rendered to biology by the ultramicroscope is in the field of colloidal liquids. If, on the one hand, we bear in mind how imperfect the studies in this department of science still are, and if, on the other hand, we remember that all living matter seems to be in a colloidal state, then we will fully grasp the great value to biology of this new apparatus.

PARIS, FRANCE.

The Leclaire Idea

BY N. O. NELSON

[Mr. Nelson may well take pride in the progress of Leclaire, his own home, as well as the home of the employees in the great manufacturing plant he created. Our readers are already familiar with many of Mr. Nelson's articles on his various social experiments.—EDITOR.]

NOT long since a St. Louis boy of twenty named De Witt killed a middle-aged woman who had befriended and fed him because she would not also supply him with money. The boy will be hung. He is a type of the town boy, grown up without regular work, spending his time with the gang, living by his wits, sometimes by outright crime. He is the material of which the criminal class is made. His class fill the juvenile courts and later on the penitentiaries. Including his minor offences he makes up a large part of the police arrests.

Arrests for all causes in cities of the United States average forty in 1,000 population per year. Many of them are for trivial misdemeanors. Many are not convicted, but all indicate some misconduct and some deficiency of character and associations. They supply the future delinquent and dependent classes.

By this average of arrests Leclaire, the Illinois factory town in which I live, should have had in its life of eighteen years 210 arrests. It has had none. It has no unemployed or unemployable. It is an unselected population of working people, of many nationalities and religions, drawn from city, town, mine and farm.

Why is Leclaire immune from De Witts and other offenders? De Witt was an unemployable, he was an irresponsible loafer who had never learned to work. Had he applied to me in St. Louis for work there was nothing he knew how to do. He would be unable to stick to work nine hours at a stretch. It would be too tedious and slow to earn his living by apprentice work.

At Leclaire every boy has a job waiting for him—an eight-hour day when he is fourteen, nine hours at sixteen. Not the deadly child labor so luridly described by the writers who hunt for only the exceptional, but the beginnings of a trade in a well ordered factory. He is keenly anxious to get at the job. He has longed for the schoolbook days to be over so that he could take his place with the men he has looked up to and the boys he plays with. He wants to be doing, he wants to make things, he wants to earn money for mother and himself, he wants to be a little man.

In my own judgment and my taste, outdoor work is preferable to indoor; the field is better than the factory. My experience in employing men and boys in farming as well as manufacturing teaches that when equally accessible and

available the commonest preference is for outdoor work. But farm labor is longer, harder and less pay. Independent farming takes capital, skill, management and responsibility. The factory job is ready at hand, easier and care-free while it lasts.

The boys in a factory town and family go at factory work. In Leclaire he can usually have his choice of six or eight trades—in brass, wood, marble, machines and housebuilding. The shops are well lighted and ventilated; the foremen are not bosses, but directors and instructors; the managers are not tyrants, but organizers and leaders. The boy starts by the side of his chum; he goes home to dinner in the company of his neighbors; he quits at 4 or 5 o'clock, gets his supper, dresses up and goes to the ball ground or the lake or the band practice or down town to see the sights and sounds of Edwardsville Court House square.

It is impossible for him to become a De Witt—he hasn't the opportunity if he has the inclination. There is no gang, there is no glory in being arrested, there are no playmates in business hours, there is play and sociability evenings and holidays. There is not even a cop to defy or a "don't" sign to pull down. Nothing tempts him to violence or offensive mischief. Fathers and sons go literally hand in hand; the boys and girls grow up together. There have been no De Witts in Leclaire—there can be none.

At eighteen to twenty the boy has learned his trade. He has never been laid off a day. He is employable and employed. At this stage the writers and theorists say he will leave us; he will want the glare and hippodrome of the city and the possible higher day rate of wages. But again the theory is smashed by the facts. The Leclaire boys, grown up and masters of a trade, do not leave. None has left for preferring a city or disliking Leclaire and the country. Very few have left on any ground. Some have gone for a week or a month, got homesick and returned.

Instead of a modern factory, overgrown with vines and surrounded by flowers and trees, their city workshops were old and dingy and enclosed by surrounding buildings and tumble down

tenements. Ugliness everywhere. His comrades were strangers, with other ideas and ideals and interests than his. He lodged in a boarding house, dismal and forlorn. His evenings could not be borne in his lonely room, he must go out for amusement, to cheap theaters (and nasty) or saloons or billiard parlors or dens. This is the life of the stranger in the cities, as I have it from our Leclaire boys and as I have found it by trying it.

The Leclaire boy comes back to his work, his people, his friends, his freedom. The evil influences of the city have not infected him; they have only shocked.

Is not the explanation simple why there are no De Witts in Leclaire, no arrests, no emigration?

And the girls! None of them has gone away to get work, none has taken hired labor, not even our own light core work in the brass foundry. Either they help their mothers or marry or have qualified for business positions. Two are well-paid clerks in the County Recorder's office, Edwardsville, immediately adjoining us, being the county seat. Some are stenographers, cashiers, one a high-grade tailoress and one was for many years our most excellent kindergarten, until she married the school principal. Of the many who have married nearly all have settled in or adjacent to Leclaire. The outside member of the couple is apparently made to understand that Leclaire must be the home.

The young people are enthusiastic about Leclaire; their visiting friends are enthusiastic. There is always something going on, if only the pleasant social walking about along the winding streets, fronted by well-kept yards and shaded with maples and elms and Carolina poplars. The family parties in the Hall, with refreshments, music and dancing, bring out several hundred of all ages. Good manners, good dressing and good feeling are more prominent in these gatherings than I have ever found in any other place. The weekly baseball games bring out audiences of about 1,000, and an equal number attend the band concert at the lake on the edge of the village. There is rowing on the lake in the summer and skating in the winter. In the winter there is bowling and billiards and

dancing. All of this is free—except a nominal charge for bowling and boats, to regulate their use—all paid for out of the common fund created by these same people.

All these attractions, which prevent the De Witts, dispense with police and arrests, hold on to our young people, are nothing but the normal conditions of a fairly well ordered community of people. There is nothing extraordinary, nothing peculiar, no standard, except in the re-

sults. There is not simply the Jeffersonian "least government," there is none; not the minimum of "rules and regulations," but none. There has been no sign of needing any.

The master key to the situation is, no unemployed or unemployable, and from this follows the rest. The Leclaire idea has been for ability to make the opportunities and leave the people to use them. They have outdone expectation, the young folks most of all.

ST. LOUIS, MO.

My Mission Class

BY THE BACHELOR MAID

If ever I did anything with conscientious motives and a becoming sense of martyrdom, it was when I took a class in the Olive Street Mission. It is true that my first introduction to it partook in no respect of anything suggesting self-sacrifice or the mortification of the flesh. I had been invited by my friend, Mrs. Cameron, to attend their customary Christmas entertainment, and I was unquestionably *entertained*; "continuous vaudeville" is an insignificant attraction in comparison. But I reasoned that to give up every Sunday afternoon to drawing into the fold of righteousness the youthful offspring of the miserable and ungodly population of the river front region would be a very different thing from playing spectator to them at a holiday function; would be, in fact, no fun at all. And, because I felt how little fun it would be, I knew that it was the very thing I ought to do, for that is one mental habit which persistently survives from the Calvinistic training of my youth. The very moment I discover something that I just *hate* to do, I also realize that that above all else is my peculiar duty. I don't always do it, to be sure, but then I agonize and despise myself for my weakness and selfishness in yielding to the suggestions of the carnal mind. And so, after that Christmas tree, I battled all thru January with my love for a Sunday afternoon of reading, solitude and an hour of music in the gloaming, and every

Sunday I hated myself the more, and got less joy out of my twilight improvisations at the piano, until on the last one of the month I closed my interesting book, hung up my alluring kimono, and started Olive street-ward.

I almost turned back at every block, but conscience drove me on till I found myself within the portals of the mission school, and proffering my services to the superintendent as a recruit to "that noble band of men and women who are striving to rescue the lost and outcast of our great cities," or words to that effect. That is about the phraseology dedicated to them, as I have observed, by those who use, to quote a profane relative of mine, "the pious lingo," and I protest that my state of mind entirely matched the orthodox phrase. I like occasionally to recall the details of that month of spiritual conflict to reassure my own self that I truly did undertake that Sunday-school class animated purely by a desire for their souls' salvation, and, incidentally, for my own clearer title to mansions in the skies. I like to reassure *myself*, I repeat, for I had not been in the work three months before my mind began to be assailed by awful misgivings. *Because it was fun after all.*

And to this day I should not *dare* let my pastor or Cousin Carrie's mother-in-law know that I have so far lost the true missionary spirit that I often am less concerned with the future of those chil-

dren's immortal souls than with the present tense of their delightfully earthly little tongues. For nobody ever heard of the true "missionary of the cross" finding *amusement* in things incidental to the rescue of the perishing—at least, nobody hears it from authenticated sources. One or two, when home on vacations, have told me confidentially and unofficially that they do sometimes see things in their mirthful aspects like the rest of us, but they know too well what the public expects ever to let the fact be hinted in literature that is to provide programs for women's missionary societies. These admissions, along with my recollections of the aforesaid conflict, do sustain me, even when Phillippina Casteneyk and Juanita Florella Castor are the funniest, in the hope that it is not *total* depravity which makes me love them more than I ever could love the exemplary girls in the class across the aisle, who can roll off the definitions of Justification, Sanctification and the rest, and never pause for breath.

Besides, if Juanita Florella and her mates are indeed only a source of worldly and unregenerate pleasure, there is the society of some of my co-workers whose plenitude of true missionary zeal affects me in such a way as to give me still a reasonable hope that it is *duty* which I follow on Sunday afternoons. When we have a teachers' meeting, and the instructor of that banner catechism class keeps us until dark discoursing upon "what we can do to give a more spiritual tone to the school," I feel that after all it was no small cross which I took up when I left behind the kimono and the cushions of my lounge.

I did not find a superabundance of religious information in my group of small girls, altho along some other lines they could, and did, impart information to their teacher. I have never yet, for instance, been able to teach the semi-annual temperance lesson with any degree of impressiveness, because all the stories that I have been able to collect as an awful warning fall utterly flat upon children whose daily experiences furnish object lessons such as I had never thought of. These lessons generally end with the teacher as the interested listener while the (theoretically) taught recite how "a drunk lady comes along on our street

sometimes, and once she tried to fight Katie Miltonberger's sister, an' another time Juanita's mother, an' she just lays down on the car track an' says she wishes to God the car'd come along an' kill her." They all avow that "our paws belong to the Temperance Society," which I hope is a veracious statement. The hours at which I have called at their homes never admit of my meeting the "paws." Among the first things which I tried to teach them, as suggested by the chance of the lessons being then in the New Testament, was the names of the Twelve, and no member of the class drank in this knowledge with more avidity than Phillippina Casteneyk ("two l's and two p's," she cautioned me as she saw me writing her name in my class-book). The next Sunday we were hardly in our seats after the opening exercises before her hand was waving in the air with the announcement that she "could tell the names of them men you told us about last week." I bade the rest give ear while Phillippina displayed her familiarity with biblical personages, which she did as follows: "Peter—an' James—an' John—an' Tom—an' Bill—an' Dick—an' Jim—an'——"

I did not permit her to complete the dozen, tho this consideration for the effect on the class was at the cost of a great personal sacrifice, but it was nearly a year before I convinced Phillippina that a universally appropriate answer—even for questions upon the flood—was not "Peter—an' James—an' John—an' Tom"—and as many others as she could get in before I stopped her.

It was Phillippina who, on my first Christmas with the class, uttered a profound truth whose pessimistic note will always linger in my memory. As a Christmas tree is provided for the entire school, the teachers do not individually give presents to their classes, but I carried with me on the Sunday before Christmas a small card apiece for my flock. They were full of satisfaction over them until Phillippina's sharp black eye caught sight of what was happening in the adjacent class of boys.

"There!" she said, "them boys is gittin' Bibles. Ain't that always the way? Men always gits more than women."

Hadn't I have been the school in

which Phillippina has learned thus early what society contrives to hide from us more protected ones till we come to a woman's years.

Phillippina is frank about a good many things, altho she generally manages to let you know that her utterance of disagreeable truths is prompted by a sense of duty and in no way by lack of affection. I am usually pianist for the school, and one day, when I returned to my seat after "Onward, Christian Soldiers," as set to Sullivan's music, Phillippina, who was familiar with the Haydn melody, greeted me with fine indignation. "They never sang that right at all," she declared. "I know, 'cause sometimes I goes to the German Sunday school, an' they don't sing it that way—not a bit that way. But," with a sudden most conscience-stricken air of realizing how this criticism must reflect upon *me*, "but you *played* it real good, Miss Parkinson."

They call me Parkinson, so far as I've ever been able to discover, solely because my name is something else.

"Oh, we know that ain't her name," they replied to another teacher's correction of them on that point, "but we just call her that anyway," and there the matter rests.

As experience notoriously modifies our views even upon matters once accepted with unquestioning faith, I feel constrained to confess that my mission work has lessened largely the impressiveness of the mental picture formed in my adolescence of millions of Sunday school scholars thruout the Christian world, all in immaculate raiment, freshly combed hair and a Sabbath cast of countenance, reciting from their leaflets upon the same portion of the Scriptures on the first day of every week. It is an impressive idea, a distinguished monument to the intelligence of the men who first conceived it. For if "all Scripture is given by inspiration and is profitable," it must necessarily be that the same selection which sets the men's Bible class to arguing on doctrinal points thru the whole lesson period is also full of spiritual milk for babes. The only equally stupendous educational policy that I can imagine would be the introduction of calculus and the history of philosophy

into the kindergartens, so that your little girl and her big brother in college might be inspired perpetually by the thought that, tho in different schools, their daily mental food is the same. However, since my Sunday school coworkers do not seem ready to see the beauty of a scheme when applied to secular education which they so blithely follow in religious instruction, they ought to pardon me if I say that I do not blame children who can barely read, and are also innocent of the amenities of polite society, if they throw paper wads and pinch each other during the superintendent's fifteen minutes' exposition of the "spiritual meaning" of a lesson from Jeremiah or the Epistle to the Hebrews. The truth is, I sometimes wish that I were not too steeped in the amenities to throw a paper wad or two myself. And yet I think that often the children would like to understand, and really try to. But in my opinion our International Lessons periodically serve up to us selections which even a genius in pedagogy could never bring down to the comprehension of the childish mind, above all, the child mind unfolding in the sordid and materialistic surroundings of city slums. Paul on the eating of meat offered to idols is by no means one of the worst specimens, yet I vividly recall the success with which I forced home to my children the "moral" of that famous argument. I had collected a fund of what I considered luminous and practical illustrations, and the children listened with rather gratifying attention. At the close of school Sadie Feahney pulled my dress just as I was starting to the door.

"Say," she said, "if dey eat dat meat it would make 'em sick, huh? Was dat what you meant?"

Sadie's younger sister Rita is a more promising subject for experimentation in theological seed planting; indeed, Rita is so amazingly clever that I confess I find it something other than amusing when I look forward to the cramped and pitiable womanhood by which that cleverness must almost inevitably be brought to naught. But just now Rita is the funniest of the whole collection, tho the startling directness of her logical processes often leaves me speechless—and argument-less.

At, for example, when at the close of a lesson on Solomon's choice, she announced with conviction, "Well, I ain't never goin' to pray to be rich, and then I *will* be."

It contributes much to the effectiveness of Rita's deliverances that her variety of vocal endowment is a deep and husky bass, which is the more awe-inspiring for being combined with a very diminutive person. As an "impersonator" I might reproduce her recital of the David and Bathsheba incident, and the subsequent and consequent afflictions of the monarch, to whom, even in his most iniquitous performances, she unfailingly applied the title, "the good king," but in unembellished print it would be futile to attempt it. Another of her versions of biblical history, however, is less dependent on elocutionary effects.

In one of the lessons I had occasion to describe to the class some of the pleasing features of an ancient Roman theatrical entertainment, and, as a matter of course, mentioned Paul's reference to fighting with wild beasts at Ephesus. Perhaps a month later the lesson dealt with his departure from that city, and I asked how long he had lived there. Rita's hand waved in air:

"I know," she growled, in her heaviest tones. "He wuz there two years, and all the time the lions wuz a-eatin' 'im."

My relations with the class are often social as well as strictly religious, and again for these functions I suppose that no credit will ever be put to my spiritual account, since they have one and all proved far more productive of entertainment than those of my own social circle, whose sole and frivolous purpose is amusement, and not "uplift." And yet I have known some degree of martyrdom for "the cause." There was a certain silk gown in which the accordion-pleated chiffon front had to be renewed three times by reason of their delight in rubbing their hands across it. "We like to see it wiggle," they said.

Our social dissipations have been various. There was the time when I took them to see "Checkers," and they became so absorbed in experimenting with the copiate ends of my over-glass that they almost forgot the play until they

were recalled by Checkers's famous malediction upon poverty. Then they stood up as a unit and cheered until the audience cheered *them*. And Katie Kinney said:

"You just bet he told the truth *then*. Yes, *sir*! My maw says it cert'nly *is* hell to be poor." And as Kinney *père* is a notoriously backslidden member of the temperance society, I am afraid that Katie's "maw" knows.

Then there was the party which I gave in my room, when a feature of the refreshments was cream puffs.

"My!" said Ida May McCloskey, "these is dear."

"Dear," to my mind familiar with a vocabulary preponderatingly female collegiate, suggested the usual undergraduate and complimentary interpretation, so I modestly replied that I was glad if she thought them nice.

"Oh, no!" she protested, "I don't mean *that*; I mean they're *dear*—they cost a lot; two for a nickel."

But perhaps the most memorable occasion was one particular trolley ride which I essayed for their enjoyment. While we awaited the arrival of two belated ones I detected signs of uneasiness and attempts at secret conference. Finally Katie Kinney, with an air of desperation, said, "Are you goin' to pay our carfare?"

"Of course," I replied.

"Well," she said, "I thought you wuz, but my sister said, 'Don't you fool yourself; *she* ain't goin' to pay carfare for you all.'"

Later I observed Katie surreptitiously tying up two nickels in the corner of her handkerchief. When aboard the car, their minds being now at rest on the financial side of the expedition, the whole eleven crowded out upon the front platform and regaled the motorman with songs not, at present, incorporated in the Gospel hymns, until they discovered how much more fun it was to come inside and ring the bells to stop the car, to the confusion and profanity of the conductor, who seemed himself to be a candidate for missionary endeavor. Downtown I undertook to steer them to a certain popular confectioner's, which undertaking I achieved after many adventures, of which not the least harrowing involved

their sudden and unanimous disappearance. While I was wondering what had swallowed them up, I heard the voice of Phillippina inviting me to "come and see a woman without any clothes on," and followed the sound to find that they had dashed into the entrance of a highly aristocratic club, and were grouped in sincere and audible interest around a statue of Venus.

The confectioner's establishment contained chairs and tables at the rear, and to these I purposed conducting the band, but to their philosophy a counter with manifest soda-water in hand was worth any number of empty and dubious tables in the bush, and before either I or the soda-fountain attendants could realize what was happening, eleven children had swooped upon the former, and were perched on their knees on as many high stools, each pounding on the marble and calling for "plenty of straws" and "lots of ice in it."

"What is it?" gasped one man, and I faintly explained, "A mission Sunday school class."

Then ensued for those maidens such a deluge of attention as will probably never again be theirs. The whole establishment gave itself up to their demands, their glasses were replenished with reckless readiness, every girl left with a bag of cakes in her hand, and nobody scolded when Juanita broke her glass and flooded herself and the contiguous territory with chocolate ice cream soda.

As I was paying the bill, the cashier entered into friendly conversation.

"What do you suppose a man said to me just now?" she asked. "While I was getting his change he looked at you and said, 'Well, I'm glad I haven't such a family as that little woman has.'"

As previously stated, the class numbered eleven, with eleven years as about the maximum age—and I so aggressively a spinster and advocate of race suicide!

I should be sorry if in this narrative of my experience in mission work I have seemed merely to wish to present the lu-

dicrous side. I have rather desired to portray the character of the soil upon which the seed of good teaching is to be sown; for a knowledge of this must antedate any successful cultivation. You may ask, as I often ask myself, whether I have seen any good coming from my work. Some of my girls, now in their early 'teens, have remained with the class since I first took it; none of them have arrived at perfection—I am afraid the same might be said of their teacher—but I have seen in them a gradual improvement both in personal appearance and a perception of intellectual and moral truths. I have frequently visited them at their homes—not as an exhorter of righteousness to them or their parents, but just as I visit my friends in the higher ranks of life—and I have seen some gratifying results in their efforts to improve their home life. One or two of my girls have secured employment in places where they are under good influences, while from the older pupils of the school a number have become useful and educated members of society undoubtedly thru the impulse received there. So, altho from week to week one may see no appreciable improvement, it must be that the work tells in the end. I have sometimes stood in the twilight by my window when the few scattering flakes of the winter's first snowstorm were commencing to fall. I have seen how their pure whiteness seemed defiled as they fell on the muddy soil and melted away. But the next morning I have looked out upon an earth all wrapped in its mantle of shining white. Something in the same way it has sometimes seemed like sacrilege to drop the pure seed in minds so irresponsive, but as the work goes on year after year it shows results in brighter and purer lives. And so I let myself hope that in some mysterious way the real friendship between my girls and me, which, at least I have as one tangible present result, may bring good into their lives in coming times, as it has even now into mine.

Woman Suffrage in South Africa

BY IRENE M. ASHBY MACFADYEN

THE following is the first and probably the last of the series of articles that Mrs. Macfadyen conducted a public debate on woman suffrage before a large audience with the Prime Minister of Cape Colony, and the public gave her the honor of the evening, and it is believed that the measure will soon be a law. It will be remembered that she did good work against child labor in Alabama some years ago.—EDITOR.]

THE question of admitting women to responsible citizenship by means of the parliamentary vote has passed the academic stage.

It is now to the fore in almost every country of Western civilization.

The newest recruit to enter the movement is South Africa. Two delegates have gone to the Congress of the International Woman Suffrage Alliance, in Amsterdam this year, from two societies—the Woman Suffrage League, in Natal, and The Women's Enfranchisement League, Cape Colony.

Altho each of these countries is self-governing and has a parliament of its own, the delegates do not represent them separately, but go as South African delegates, since there is a strong probability that all the states of South Africa will shortly find some means of closer union and come under one government. The women of South Africa have been among the first to feel and act upon the national sentiment, and the Cape Colonial League has honorary members in the Transvaal and Orange River Colony.

With the advent of South Africa, the fourteenth country to join the Alliance, the movement has banded the earth, and the triumph of women's claims to citizenship is assured.

One has a perfectly unique opportunity in South Africa of watching and assisting in the development of what is known as the "woman's movement." It is really new here. In every other English-speaking country it is a generation or more old. But life in South Africa, despite occasional alarms and excursions, has gone at ox-wagon pace, long after the rest of the world has taken to steam, not to speak of electricity.

There is only one really modern center—Johannesburg. That city, which is barely twenty years old, has been almost entirely a male community. The element of home has hardly entered into it. With

the exception of the coast towns, the other centers of population have been little more than villages. The great bulk of the white population is made up of the farmer class, corresponding fairly closely with the planters of the Southern States, with a residuum of poor whites, who may be compared with the "Crackers" of the South.

A pretty story is told of the ancestor of the present Cape family of Du Plessis. He was descended from a Huguenot refugee belonging to the same family as Cardinal Richelieu. After the French Revolution, when most of the nobility of the "*ancien régime*" had been killed, and Napoleon desired to re-establish an aristocracy to uphold the imperial throne, he sent emissaries to the nearest legitimate heir to the title who was left, this South African farmer. Du Plessis received his guests with courtesy and treated them with the traditional colonial hospitality, but when they urged their mission he showed them his wide domain, his cattle, the great ox-wagons ready to carry produce to the nearest market, his large, contented family, a village in themselves—sons and daughters, daughters-in-law and sons-in-law, and their relatives, living as "*bywoners*" or tenant farmers on his ample land—and told them he had no mind to exchange such security and independence for the bickerings and servilities of a court. So the ambassadors departed alone to the great Emperor who had sent them.

That spirit of independence and aloofness has been kept in a large degree by the Afrikaners.

South Africa has scarcely been touched by industrialism, which, without the only real democratic control by both the masculine and feminine spirit, eats away the very heart of the modern state—the homes of the common people. Modern life and conditions, however, are invading South Africa with a rush. Within the

last twenty-five years it has been intersected with railways; newspapers have sprung up like mushrooms. The great influx of foreigners with the opening up of the gold reef of the Rand, and the consolidation of the Kimberley diamond mines, has brought the country into direct connection with the stock exchanges of the world. Year by year the distance between Cape Town and London, between Johannesburg and New York, has been reduced by more rapid transport, and finally the country has been stabbed wide awake by the late Boer war, with its accompaniments of thousands of strangers from all parts of the earth, and the enormous attention devoted to its affairs by the European and American press.

With a splendor of recuperative powers scarcely realized out of the country, South Africa is arising from the crushing blows of the war and the recent commercial crisis, to attempt the colossal task of welding the separate colonies into a nation.

It is natural that just at the psychological moment the claims of the women should take definite shape.

Since 1902 there has been a Woman Suffrage League in Natal, which has done good work, while in that colony and the late Dutch republics women have taken a prominent part in politics and journalism. Just over a year ago, in April, 1907, "The Women's Enfranchisement League" was formed in Cape Colony, with the sole object of enlisting women of every shade of opinion and party who realize that it is their right and their duty to obtain the vote on the same qualifications as it is granted to men.

One of the founders was naturally Olive Schreiner, the South African woman genius, who belongs to all the women of the world that articulately or inarticulately dream with her of the heaven to be—on earth—in the future, when on the hills will walk brave women and brave men, hand in hand, looking unafraid into each other's eyes, and the women also holding each other's hands!

Soon after the inception of the movement she came to Cape Town from the little Dutch "dorp" where she lives with her husband, Cronwright Schreiner, who is a Member of Parliament. She got prominent women on both sides of poli-

tics to hold drawing-room meetings, and helped to arouse interest among the Members of Parliament. She is too delicate to do much speaking, being a victim of asthma in its most trying form, but her vivid personality added *verve* and interest to the new movement.

Nearly three hundred women have already responded to the call to band themselves together, and an astonishing amount of public interest in the question of votes for women has been displayed. This winter there is scarcely a church guild or debating society of any sort in the Cape peninsula which has not a Woman Suffrage evening; while our few speakers are overwhelmed with requests to address public meetings from all over the colony. In this country the question has some features of extraordinary interest. For instance, it is only in the towns that the idea of woman's inferiority to man has to be combated. Olive Schreiner was telling me one day of the wonderfully equal terms on which boys and girls stand in the up-country Dutch families. A Boer farmer simply cannot understand the English and American custom of providing more amply for the boys than the girls. For every penny set aside for a boy's education or capital for the development of farm or business, or preparation for a profession, a like amount is laid aside for the girl. In the past this sum was almost invariably used for her dowry, in order that when she married she should take something into the common stock. Nowadays a great part goes for her education, sending her to the distant school from her home on the farm, several days' ox-wagon trek, maybe, from the nearest railway.

Olive Schreiner knew a man who, married out of community of property (so that he could dispose of his separate estate by will), planned, after making provision for his daughters, to leave his farm and the bulk of his fortune to his idolized infant son, who had come, long desired, after a troop of girls. The babe was seized with illness and died. When the stricken father spoke of his loss to Olive Schreiner he said: "It was the judgment of Heaven for my injustice," and told her of his designs, known only to his own heart, and his conscience accepted the bereavement as a deserved punishment. Such a sense of "equal

rights" of sons and daughters can only be paralleled in Europe and the States among the idealists.

The Boer woman is in everyday life the partner of her husband. She takes her share in the supervision of the farm and the stock, and her assent is obtained for every business transaction. No farmer would sell part of his land without his wife's knowledge and concurrence. As in all countries where a small white population has had to hold its own amidst hordes of a lower race, men and women have shared together the perils and hardships of pioneer life. In the days before the natives had been conquered or subordinated, the wife stood by her husband in "laager" to defend the home and the children. If he did the actual shooting she loaded the rifle, and in the last extremity died at his side. These things bite deep into the being of a race, and the Afrikaners, mostly of mingled Dutch, French, English and Scottish stock, are a tenacious people, and the men will never forget the heroism and endurance of their womenfolk.

Since the British gave responsible government to the Cape and Natal, before the Transvaal and Free State existed, the country has been governed under Roman-Dutch law, which in several respects is more just to women than the common law of England (which formed the basis also for American law).

In married life the law recognizes community of property, and altho treating the wife as a minor during her husband's lifetime, gives her half of the entire property at his death (unless any other arrangement has been made by joint will or ante-nuptial contract, both of which are based on the principle that men and women are equally able to dispose of their property by contract).

In inheritance, children are heirs equally with each other, neither primogeniture nor sex having any effect.

Illegitimate children can be made legitimate by the marriage of the parents, however long after their birth it may take place, and acknowledged illegitimate children rank first as heirs to a man's estate if he dies intestate after the legal wife and her children, before any other relatives.

Thus sentiment, history and law in South Africa provide a splendid foundation for a healthy development of the

woman's movement. It is acknowledged by men on all hands that the women of this country have only to show convincingly that they desire the franchise in order to get it.

The first women's franchise resolution was brought into the Cape Parliament last year by a Dutch doctor. Men on both sides of politics spoke in its favor.

I sat by Olive Schreiner's side in the Speaker's gallery thruout the debate. She has waited so long for the ripening of the seed she sowed by her books, which are still in the van of world thought on the subject, that she could hardly contain her excitement. Her husband, a stanch friend to all women, made a fine, manly speech in its favor, of which, by the way, she had not heard a word previously, and one of the Dutch leaders, a well-known journalist, made a most moving plea on the ground of the woman's handicap of sex and suffering. The House was forced to the vote by a telling speech from the other side asking that such a serious issue of justice should not be shirked. When the tellers handed in their count it was found that twenty-four men, exactly twelve from each party, had taken their place on the left in favor of the resolution, the first really "cross vote" in Cape politics for years.

That is our parliamentary nucleus in Cape Colony for the bloodless revolution that will associate women with men in the building of the future South Africa.

Since then there has been a general election, and our League has catechized every candidate, with the result that some thirty elected members, drawn from both sides of the House, are pledged to support our cause. In the Transvaal and Orange River Colony several members of the Government have exprest their belief in the value of woman suffrage.

It is likely that the imminence of closer union which is arousing the interest of all South Africa will greatly quicken the movement. We believe that when the Convention on Closer Union meets, after the subject has been discussed in the separate parliaments, it will receive a demand for citizenship from the women of South Africa, backed up by the co-operation of many thinking and able men, that can not, will not, be ignored or denied.

Literary Anemia in France

MODERN French literature bears at least one of the characteristics of decaying periods: it is rather imitative than creative, and more Alexandrine than really artistic. Not one of the works published during the bookselling season just closing has been conceived otherwise than as a clever or ingenious manifestation; not one claimed or even pretended to claim a wide human object, such, for instance, as that which Mr. Galsworthy evidently proposes to himself. The reasons—for there must be many—can hardly be exclusively literary. We rather suffer from an excessive attention to the technical side of literature. But the same general anemia which we see prevailing in the public life of France weakens her art as well. Men wavering between theories and uncertain about the most vital moral or religious issues inevitably lack the vigor indispensable for the higher class of literary productions.

The only work in which we can detect a better sort of inspiration than that which results in a "readable book," is the *Colette Baudoche* of M. Maurice Barrès. The *dilettante* of twenty years ago has gradually become, as he grew older and felt the responsibility of success, a rather narrow-minded but undoubtedly sincere Nationalist. He has not more talent, but he is a better man, with a nobler ideal, and the consequence is that we *believe* in the heroism of his Metz girl placing the honor of France before the interests of her love for a young German. Yet the book is still occasionally encumbered by superfluous descriptions or by the writer's personal reminiscences, and, as a novel, it will, tho convincing, appear very slight indeed. M. Barrès has been too long exclusively attentive to himself, his sensations, his moral development, etc., to be capable of centering his observation on a human life—even one not very different from his own, like that of Colette Baudoche—and of depicting it in broad, warm touches. Think of "l'Homme Libre" or "Bérénice," or any of Barrès's

early works while reading *Colette Baudoche*; you will be delighted. Think of Balzac's shortest story, you will feel that the comparison is disastrous for the younger writer.

Colette Baudoche was a great success, the greatest success in fact that M. Barrès has ever known, but its circulation was little compared to that of M. Anatole France's *Ile des Pingouins*. Anatole France is probably the best, I mean the most highly gifted representative of contemporary French literature. To no one can the category of Alexandrinism be more accurately applied. He has unbounded wit, a vast learning, a wonderful style, a charming gracefulness of manner, but he is one of those men whose imagination cannot work spontaneously, and who need something to take their spring off, just like the actor's originality only appears when he has something to interpret. Anatole France never wrote anything worthy of his reputation except when imitating Voltaire, as the "Lettres Persanes," or when caricaturing the old legend-tellers. This confirmed sophic once turned violently dogmatic, and went about sowing the seed of Socialism. He lost even more by the job than M. Bourget did by becoming a Royalist. All he gained was to cause bewilderment or amusement, and he quickly reverted to his natural character of a jester of genius. He did well, as far as literature goes, but no amount of talent will reconcile serious readers to everlasting irony, and when the sarcasm turns profane and revels in its own bitterness irrespective of reasons and effects, the writer can no longer be judged by exclusively literary standards. The *Ile des Pingouins* is a long satire not only of existing abuses in the present condition of France, but of her whole history in its most venerable aspects, and, as if the author wanted to show that the pleasure of stringing pretty sentences is all he cares for, he could not refrain from putting in an allegorical demonstration of the utter futility of what is generally called morals. Another volume published a few weeks ago, *Les*

Le Petit Comte de la Barbe Bleue, is not so bad tho' not free from the same fault, but if the devil turned writer and took it into his head to rewrite the "Pilgrim's Progress" the effort could not result in something very different from the *He des Pénitents*.

M. René Boylesve is not an imitator of Anatole France, but he is an imitator of his method and seldom ventures on producing anything that does not look like a replica of an eighteenth century story. He gives exquisite titles to his books, and the catalog of his works looks exactly like that of an exhibition of the school of Watteau. *L'Enfant a la Balustrade*, *La Légende d'Amour dans un Parc*, suggest much more readily a graceful, bright little canvas by Pâter or Lancret than even a prose pastel. M. René Boylesve puts those charming labels on rather indecent subjects which he treats in the most decent manner. That is in the tradition of the *genre*. Whenever M. Boylesve does not happen to be supported and guided by some classic of this special kind of literature he is apt to indulge in sheer brutality. Nothing can be coarser in style and more deficient in inventiveness than the *Parfum des Iles Borromées*. But the moment he reverts to the manner of Laclos he can deal daintily with the most difficult subjects. Environment means everything to this sort of talent; matter counts for very little. M. Boylesve's last volume, *La Jeune Fille bien élevée* is the commonplace story of a girl who is compelled to marry the man she does not care for and give up the one she loves. Were it not for the poetry inevitably emanating from the mysteriousness of a girl's nature and from the old-fashioned scenes in which the story is located, such a theme would be simply unbearable, but M. Boylesve slips his prism between us and his trivialities and they appear fascinating. This is not great art of course, and the least effort to be really sincere is a great deal more effective, but prettiness is pretty.

A pupil of M. Boylesve's—young and rather effeminate as he is, he is the head of a small school—owes it to his youth to have surpassed his master, just because he is still able to believe in his inspiration instead of being sure of his trick. M.

vandoyer's *Mon amour* is a touching little novel whose every touch is convincing altho' it constantly reminds us of M. Boylesve's *première*. In the same way Corot and Troyon thought they painted like their masters when they were only absorbed by their subjects.

M. Romain Rolland goes on with the story of his artist, Jean-Christophe, at the rate of two volumes a year. They are written in the swift, light tone of Stendahl, which enables the pen to travel fast and saves the novelist the trouble of looking for a plot. Here again we find inspiration closely dependent upon imitation, and M. Rolland would be less prolific if he made up his mind to be himself and nothing else. His Jean-Christophe is in his seventh volume long before being in his prime, but we have made up our minds long ago that M. Rolland's analysis of artistic development exemplified in the life of one artist has been conceived on extremely broad lines, and we are content with the light interesting narrative he gives us. The present volume is called *Dans la Maison*.

M. Marcel Prévost, who has just been elected a member of the French Academy, professes to be only a realist, and, in fact, never looks to atmosphere to soften and give color to the outlines of his stories. He is always modern, always interesting and not always so immoral as he used to be. Unfortunately he is too easily satisfied with providing the reader with employment for three or four hours in a deck chair or on a hotel veranda. But dealing in the literary *Article de Paris* hardly deserves to be called literature, and M. Prévost's election at the Academy appeared rather scandalous to the small section of the public who still know what the distinction means. The new member's novel, *Pierre et Thérèse*, which appeared in the *Revue des Deux Mondes*, is built exactly like a play of Henry Bernstein, and would leave the same impression if it were acted rather than read. Thérèse is a charming girl who marries a swindler, discovers her mistake and forgives her husband. No imitation here, no poetry, no sophistication, but no art except that of deftly introducing improbabilities.

The essential weakness of all this literature appears in a more cruel light

when contrasted with the art of a more robust period. Read M. Doumic's *George Sand*, and you will realize how much more masculine that woman was than our pretty story tellers. Her life was quite as romantic as her wildest novel, and M. Doumic tells it admirably.

ERNEST DIMNET.

PARIS, July 25, 1909.

Novels for Summer Holidays

WHEN one is packing his bag for a vacation he needs to put in a novel just as he does a mosquito bar, and for much the same reason—to keep things away that might otherwise get to him, singing, tantalizing cares. There is nothing like a good story to separate the mind from the business or domestic world of anxieties and worries, because it provides another world where everything turns out well, or where they ought to turn out well. In this review, therefore, you will find a brief mention of a dozen stories suitable for casting the proper glamour over the reader's spirit during a holiday.

If you are an aristocrat, born and bred, you cannot do better than choose Ellen Glasgow's new novel, *The Romance of a Plain Man*.¹ If not, it is best to avoid it. The author dramatizes in a perfectly truthful manner the difference between the temperament of an aristocrat and the character of a "plain man"—and there you have really what she is driving at in part. The aristocrat may not have a character worth mentioning, but he is bound to have temperament, while the "plain man" may have an excellent character, but his temperament, if he has any temperament, may be a very egregious disqualification. In this story the difference between the two is highly complimentary to the "plain man," and by no means disfiguring to the aristocrat, but we advise against the "plain man's" choosing it for his vacation story, because the book contains the most odious and exasperating comparison made between different classes, not in society, where kinds are sadly mixed on account of dollar marks, but in nature. The fact is that Miss Glasgow has evidently attempted to do the thing that Miss John-

ston attempted earlier in the year in her novel, "Lewis Rand." Each story depends for interest upon the varying pedigrees of the characters represented. Mary Johnston showed the power, ambition and unscrupulousness of Lewis Rand, and proved the tempered steel of a patrician woman in the loyalty and integrity of his wife, Jacqueline. Ellen Glasgow proves many of the same conclusions in her story, except that the "plain man" is a nobler man, and Sally, the patrician wife, is a finer, clearer, flamelike creature, in spite of the fact that Mary Johnston knows how to decorate a woman with sweeter, fairer words. And for excellence of interpretation it is a draw between these two Virginia authors, both of whom are a trifle too much inclined to intimate the peacock tails of their own excellent pedigrees in fiction. It is a vulgarity peculiar to aristocrats.

If you are a man, and have not already read the story in the *Saturday Evening Post*, you might choose Richard Harding Davis's novel² for your vacation diversion. He has a bully-boy literary style and a way of slinging his arms and legs about in a story that should be very attractive to men. The book tells of the adventures of some young men, who, being rich, idle and half drunk, band themselves together one night in "The Order of the White Mice," whose purpose was to "save everybody's life." They did not accomplish it, owing to the settlement house workers, missionaries, the devil and other outside forces for and against human life, none of which Mr. Davis mentions, of course, but what they did do makes a very interesting tale. But if you are a woman, by all means take Rose O'Neil's novel,³ or that anonymous one, *The Inner Shrine*. If you are still femininely radiating, take the former. It recounts the adventures of a pretty woman, a handsome man, a hypochondriacal thief, a little boy and an old gentleman. The author must have received the latter as a legacy from Dickens, for Dickens never created a more diverting travesty upon amiable foibles and virtues. We have not had a story with more illusive charm, that was more innocent, or tear-

¹THE ROMANCE OF A PLAIN MAN. By Ellen Glasgow. New York: Charles Scribner's Sons. \$1.50.

²THE ORDER OF THE WHITE MICE. By Richard Harding Davis. New York: Harper Bros. \$1.50.

³THE ROMANCE OF A PLAIN MAN. By Ellen Glasgow. New York: Macmillan Co. \$1.50.

fully witty, since "The Loves of Edwy," by this same author, appeared years ago, which John Drew pronounced one of the masterpieces of American fiction. If, on the other hand, you are come to the years of reform in a woman's life and care more about being good than radiating, take *The Inner Shrine*.⁴ It recounts the story of a very fast lady who reformed without becoming angelic; but do not build too much hope on the sequel where she marries again and better. A woman who has faded till she is wrinkled and blear-eyed and duty-going is not so attractive to men as this one is represented as being.

Every year there are a number of returned missionaries in this country resting from heathendom. We earnestly suggest, if they are sufficiently recovered to read fiction, that they take a look at Mr. Henry Milner Rideout's story, *Dragon's Blood*,⁵ not because it is moral, because it is not. Apparently the Caucasian in China, unless he is a missionary, acts up to his limits in immorality, even as the heathen do—but from it the missionary may get a wider vision of his own specialty—the heathen. For years the returned missionary gives the impression in his native land of being a returned horror hunter. He is a sensational feature in any pulpit and worse than the worst page of a Sunday supplement in the monstrous tales he tells. In this way we have received a gory, deadly impression of the heathen, but we have received no impression at all of his point of view, of his philosophy of life. Neither does the returned missionary give any such impression of the myriad life of China as we find in this book. He merely insists that many, many people live there. But a missionary can lay only one kind of a scene as a rule—one with a commonplace horror in it. Mr. Rideout does not omit the horror, but somehow we get a sense of the immeasurable mystery of China, of a real darkness, of a mortal mind infinitely different from our own. So far as enlightening this country is concerned about the heathen ends of creation, the novelists are doing it better than the missionaries.

There is a class of excellent old ladies, the kind who never leave the veranda of the summer resort where they are staying. Naturally they cannot crochet and gossip all the time. They always have crystallized girls' minds, and like an old-fashioned story of "love and adventure." Let their sons and daughters in law send them either of the following novels: *Dromina*,⁶ another story of the ill-fated son of Louis XVI, this time figuring as the king of a band of gypsies. There are enough desperate doings in the book to stir any grande dame's fine blood. Or send them Mr. Percy Brebner's story of a *Royal Ward*.⁷ The scenes are laid far back in the blood-and-thunder time of kings and pirates and smugglers, and the last scene represents the villain, a most admirable villain, riding sublimely to his death over a precipice in order to save the lives of a number of people whom he has betrayed and persecuted, evidently to please the author, who needed that kind of material for his story. Or, if they are ardently romantic, severely spiritual, send Joseph Hocking's novel, *The Sword of the Lord*.⁸ The scenes are laid in Germany during the life and time of Martin Luther. The author has done his best to get the times in and has succeeded but indifferently well, like a smith who tries to make a tempered sword out of pewter. His mind is not a sufficient furnace for the task, but the old ladies will not suspect this. They have the sweetest, liveliest imaginations left in this disillusioned world, and they would be sure to enjoy this story.

We recommend the *Journal of a Neglected Wife*⁹ to any tired-out husband who is fortunate enough to get away from a hysterical wife for a few days' peace and recreation. He is the only man who can appreciate the point of the book, namely, that she is a neglected wife because she is a treacherous woman who watches her husband and thinks against him in her own heart, even when he is innocently drinking his coffee and eating his break-

⁴DROMINA. By John Ayscough. New York: G. P. Putnam's Sons. \$1.00.

⁵A ROYAL WARD. By Percy Brebner. Boston: Little, Brown & Co. \$1.00.

⁶THE SWORD OF THE LORD. By Joseph Hocking. New York: L. P. Dodd & Co. \$1.00.

⁷THE JOURNAL OF A NEGLECTED WIFE. By Mabel Hubbard Loomis. New York: H. W. Dodge & Co. \$1.00.

⁸THE INNER SHRINE. New York: Harper Bros. \$1.50.

⁹THE JOURNAL OF A NEGLECTED WIFE. New York: Houghton Mifflin & Co. \$1.00.

fast. Husbands in such positions are not justified in taking mistresses, but the explanation of why they do it can be found in such books as this. The cleverest thing about the book is the *dénouement*. The last few pages effect a complete reversal of the reader's point of view. Having duly sympathized with the wronged wife and hated her rival all thru the volume, he finds at the end that the latter is the better woman and the more wronged.

The young mother who is spending the summer on a farm somewhere, with her first baby, who has just been put into blue and white checked rompers, will appreciate *Peter-Peter*.¹⁰ But she should be careful not to read too much of it aloud to her young husband. A real young husband and father would never have nursed twin babies while his wife gave music lessons, and then have written a book of baby poetry besides, even if he did have sore eyes, as is represented in this story.

For the sake of the lieutenants and ensigns on vacations we are putting into this list Jacques Futrelle's delightful story, *Elusive Isabel*.¹¹ The name gives little idea of the charm of the tale. The scenes are laid in diplomatic circles in Washington. The Secret Service police do most of the acting, and we learn for the first time that they alone hold the government together and prevent annoyances like a world war, for example. There is a wireless maniac, with a diabolical percussion cap, who comes near ending the story too soon by blowing up everybody who figures in it two chapters before the end. But the thing turns out properly by a hair's breadth, and there is a lot of good detective work done in it of the romantic kind. The book really deserves attention from the War Department, for if the author's theory of the percussion cap could be realized, the United States could hold the peace of the world in a little globule of copper no bigger than a robin's egg.

It is hardly worth while to suggest any intellectual entertainment to the motoring vacationists; they do not need it, but in case the car blows up a tire

and there is a wait of an hour or so before they can go on, it is best to have a copy of C. N. and A. M. Williamson along to pass the time.¹² These writers are endeavoring to produce fiction as near like motoring as possible. The scenes are not laid anywhere, but they manage to carry the same set of characters along in the auto thru any Trinidad or Versailles. Speed-mad people will find familiar sensations in the book.

Professor Thomas's German Literature

PROF. CALVIN THOMAS'S *History of German Literature*¹ is, within the lines firmly laid down by its author and rigidly adhered to, as thoro and well-balanced a piece of work as the program of the "Literatures of the World" series, of which it is the thirteenth volume, will allow it to be. It is a bewildering task to compress within "about three hundred and fifty 12mo pages the entire literature of a country, giving its development, history and character, and its relation to previous and contemporary work," yet that is the program of this series as laid down by its editor, Mr. Edmond Gosse. Only a ripe scholarship, an unerring judgment of comparative values, a confident familiarity with main currents, can succeed in the performance of such a task, and Professor Thomas, having accepted the conditions, has succeeded, sacrificing much of his gigantic subject on the Procrustean bed of those three hundred and fifty 12mo pages, yet respecting its individuality in its large, general outlines. What shall be said hereafter applies, therefore, not so much to his book as to the conditions of the series.

What should be the scope of the history of a country's literature? At the very beginning of an inquiry into this matter one is confronted by another question, an old one, to which many students have sought to give an answer: "What is literature?" And when we seek light from these questions in the an-

¹²A HISTORY OF GERMAN LITERATURE. By CALVIN THOMAS. New York: Doubleday, Page & Co. 1911. \$3.00.

swers they have formulated, we shall find that their definitions vary greatly; also, that often they are not definitions at all. The preponderating opinion considers literature as one of the fine arts, confining the word's legitimate meaning strictly to *belles lettres*, itself a sufficiently vague term. This definition is, however, chiefly for the guidance of the literary critic. One doubts if it is binding upon the historian of literature at all, it is so rigidly exclusive.

De Quincey's recognition, as part of literature, of the enormous volume of printed books which the belletristic or "creative" definition excludes is the truer one, certainly so far as the history of literature is concerned. His well-known division of the domain of letters into two provinces, that of "the literature of power," of emotional appeal, and of "the literature of knowledge," covers the field completely. It admits not only the vast literature on the borderland of the belletristic definition—religious literature, for one, more potent in its power to move than poetry itself, history, philosophy, biography—but also that vast library of modern science which has decided the tendency of contemporary letters the world over. The student of the creative literature of the last quarter of a century will find its ultimate inspiration everywhere in science. Darwin's and Spencer's influence has been felt potently, the changes from Hegel and Fichte to Schopenhauer, to Nietzsche, in the field of German philosophy, have added their impulse; so has the higher criticism. In the history of literature the true formative influence in modern days is to be found only in the books excluded from its territory by the belletristic definition.

Professor Thomas, however, face to face with the problem of the limitations of the space at his disposal, has adopted the belletristic definition, and adhered to it thruout. The book will do, it will serve capitally the "general reader" for whom the series is intended, but the student, after recognizing all this, has a well-defined sense of incompleteness in a history of German literature in which no place could be found for Romanticism—weak tho' was the influence of humanism

in the formation of modern German letters, which is the child of the Reformation almost exclusively—a history whose scope cannot make room for Mommsen and Curtius, Sybel, Ranke and Treitschke, for Karl Marx, Haeckel and Buechner, which gives David Friedrich Strauss a bare mention, which excludes Harnack and Kuno Fischer, and banishes Bielschowsky to the brief biographical notes at the end. The list could, of course, be indefinitely prolonged. It is the fault of the series, not of the contributor.

Samuel Pepys, Administrator, Observer, Gossip. By E. Hallam Moorhouse. With 24 Portraits and Other Illustrations. New York: E. P. Dutton and Co. 1p. x. 327. \$3.00.

Well known as is the immortal diarist there was certainly a place for Miss Moorhouse's admirable life and appreciation of Samuel Pepys. It is not every reader, even among the serious students of English history, who has the time to go faithfully thru the hundreds of pages of the famous diary. Nor is it every one who can form a right estimate of the author even after a careful reading. The thousands of minute observations, the multiplicity of detail, the lack of balance between the important and unimportant affairs of life, and the impossibility of putting events and characters into correct perspective when one is brought into such marvelously close intimacy with the very soul of a man, make the diary perhaps the worst guide possible for many readers to the character, worth and achievements of the great secretary to the Admiralty. Even to those readers who are gifted with the sympathy and perspicacity which enable them to form a true appreciation of Pepys from the diary, there is the further drawback that its pages cover only the years from 1660 to 1700, and that the long and faithful service rendered by Pepys after the condition of his eyes made it impossible for him to continue his private record is not therein to be found. Miss Moorhouse gives a survey of the whole life of Samuel Pepys, quoting largely from the diary for the years for which such quotations are available, and using for "Memoires of the Royal

Navy" for the later years of his active service. While not an indiscriminating admirer of his subject, Miss Moorhouse is more indulgent in her estimate of Pepys's private character than are many of the readers of the not always edifying confessions that Pepys set down by night in secret cipher in the locked volumes of his diary. She recognizes the fact that mankind is totally unaccustomed to such absolute frankness and veracity, and that the tendency is to use the same standard of judgment to the man who thus sets forth his most secret thoughts, naked and unashamed, that one would use in measuring the utterances of ordinary men, who, naturally keeping back much which is known only to themselves and which would be discreditable to them, represent themselves as they wish to appear, rather than as in their own inner thoughts they oftentimes actually are. To estimate Pepys rightly he must first be clothed and put on the same basis as his fellows, and so far as regards his public service and his actual conduct, both toward his friends, his family, his superiors and his subordinates, he well bears comparison with the men of his time and position. In fact, the more he is studied, the more he draws out affection and admiration. We may agree with Miss Moorhouse that he had little spirituality and that he was not of the stuff of which heroes and martyrs are made. But his kindness, his fidelity to duty, his manly courage even when he was afraid, and his vivid enjoyment of the world and of life make him a most human figure in a somewhat uninteresting age. Who can refrain from a sympathetic approval of his determination to extract honey from the wayside flowers while they were still blooming, which he wrote down in his diary at the age of thirty-four:

"The truth is, I do indulge myself a little the more in pleasure, knowing that this is the proper age of my life to do it; and out of my observation that most men that do thrive in the world do forget to take pleasure during the time that they are getting their estate, but reserve that until they have got one, when it is too late for them to enjoy it with any pleasure."

The illustrations with which Miss Moorhouse has adorned her book include portraits by Kneller and Hales, and some

very interesting reproductions of steel engravings of views of London in the seventeenth century. Incidentally to her history of Pepys, Miss Moorhouse gives a remarkably able sketch of John Evelyn, the friend and contemporary of Pepys, and also to some degree his rival as a diarist.

A Little Maryland Garden. By Helen Ash Hays. Fully illustrated. New York: G. P. Putnam's Sons. \$1.50.

We have had "Pot-pourri from a Surrey Garden," with the pleasant companionship of an intelligent guide; "Elizabeth and Her German Garden," with the freshness of spring salad and its tang of mustard and sage; Candace Wheeler has given us the artist's garden, with its scheme of color; and, with its mild love-story, Alfred Austin has told us of "The Garden That I Love." Here is another local garden. Like "The Chronicles of a Cornish Garden," this book was written partly as a series of letters for a newspaper. It is a bright, chatty account of the author's experiences along the successive months of the year. The book has many quotations, and tells of "the vivid sky-blue Tibetan poppy expanding its crinkled crêpe-de-chine petals in the sand." The garden-lovers will be glad to enter a new garden even in a book, and this Maryland garden is a pleasant one. The book has eight colored illustrations and many dainty drawings dropped like pressed flowers on its pages.

Literary Notes

...By royal decree the Greek Government announces that it has decided to signalize the coming centennial of Grecian independence by the publication of that long felt *pnum desiderium*, a complete and scientific thesaurus of Greek language from the earliest period of Greek literature to the present times. Prof. G. N. Chatzidakis, of the University of Athens, the prime mover in this great enterprise, is in charge of the work, and in a recent number of the *Panathenaea*, the leading popular library journal of Greece, publishes a complete program of how the work is to be done. A beginning is to be made with a modern Greek dictionary and materials are being collected in all parts of the Greek world.

...The Assyriologist of the University of Marburg, Prof. P. Jensen, whose ponderous

...at a thousand years—entitled *This Gift of a Bible to the Christian Church*, is well calculated to show what the bulk of Old Testament histories, as also the story of Jesus in many of its details, are adaptations from the experiences of the Babylonian hero Gilgamesh. Jensen has turned his former criticisms in a sonnet work entitled *Moses, Jesus, Paulus, Die Sagenmänner des babylonischen Gottmenschen Gilgamesch*, in which he applies his former methods, particularly in the case of Paul. The spirit of the book is well reflected in the subtitle, viz., "Eine Anklage wider Theologen und Sophisten und ein Appell an die Laien." Jensen has a mass of new and good material, but it is handled in too radical a spirit.

...Theological journals of a high grade defending with more or less vigor yet with an open eye to real advancement in research the older teachings of the Church are constantly increasing in number. The famous *Beweis des Glaubens*, so long and ably edited by Professor Zoëckler, and the leading apologetical monthly of the world, now appears as *Der Geisteskampf der Gegenwart*, with E. Pfennigsdorf as editor. *Glauben und Wissen*, with Prof. E. Denner and Grützmaier as editor is equally able and cheery. *Die Zeit*, edited also as a monthly by Dr. Julius Boehmer, appeals chiefly to pastors and students, and like the other two deals largely with problems that are now *sub judice*. All three are, in the best sense of the word, up-to-date journals.

...A new edition of Miss Alice B. Kroeger's useful *Guide to the Study and Use of Reference Books*, first published in 1902, contains numerous additions, the index having received particular attention. Librarians know the work; it will be found of service by those using works of reference, but, of course, it is far from complete, as the compiler herself, knowing full well the enormous extent and difficulties of the field, frankly admits. Those having experience of reference work are duly thankful for every effort made to facilitate their task; and Miss Kroeger deserves thanks. (Boston: American Library Association.)

...*Fifty Years of Modern Painting: Corot to Sargent*, by J. E. Dringman (London, \$3), is a readable account of the "progress" of the art of painting in the second half of the nineteenth century written by an Englishman for his own countrymen, and therefore disproportionately concerned with British art. Preraphaelites and impressionists receive most of the author's attention. Other painters get rather scant treatment—tho evidences are not wanting of a sincere attempt at impartiality. Thus the work of American painters is in the main very fairly characterized. The book has no critical value—the author completely overlooks the real worth of some of his best admired painters, of Corot, for instance, who appears merely as a forerunner of impressionism, and of Millet, whom he considers merely a realist. But any book that comes to these painters' names is worth while.

Pebbles

And Peanut Butter from a leafy cow,
Six Dates, a dab of Olive Oil, and Thou
Beside me Fletcherizing Uncooked Bread,
And that's what I call Solid Comfort now.

Sir, a tank. What on earth are you fellows doing? There hasn't been a hit signaled for the last half hour.

Private—I think we must have shot the marker, sir!—Punch.

PRESIDENT NICHOLAS BROWN, for whom Brown University was named, was fond of quizzing small boys. One day, while walking in the streets of Providence, he came upon a little fellow who attracted his notice. "How do you do, my boy?" said the president. "What is your name?"

"My name is Harry, sir," replied the child.

"Harry, is it?" returned President Brown. "And did you know the evil one is often called Old Harry?"

"Why, no, sir," answered the boy. "I thought he was called Old Nick."—*Providence Journal*.

MARY, aged fourteen, was found one day by an older sister sobbing and crying.

"What is the matter?" she asked, with great concern.

"Three boys have asked me to go to the dance tonight," was the unexpected reply.

"Well, my dear child, certainly that is not such a terrible misfortune."

"Yes, but I told the first one I would go with him, and the last one was a long-panter!"

"In time of peace prepare for war"—

The ancient rule they wish to bar.

Why should the nations seek for gore?

A better way we find today—

In time of peace prepare for more.

—*Chicago Daily News*

A LITTLE girl was in the habit of telling awful "stretchers." Her auntie told her she could never believe her; and, to warn her, related the tale of the boy who called "Wolf, wolf!" and how the wolf really did come one day and ate up all the sheep.

"Ate the sheep?" asked the child.

"Yes."

"All of them?"

"Yes, all of them," said the auntie.

"Well," said the little one, "I don't believe you, and you don't believe me. So there!"

—*Harper's Magazine*

THE anarchist was examining the new infernal machine. "The fellow who made this did a pretty bomb job," he remarked. The shell exploded with laughter.—*Harvard Lampoon*

THE hunter and the lion met

A-walking on the plain;

The hunter ran with all his might,

The beast with all his mane.

The later hunter ran across

The lion in its flight;

He showed his teeth, the lion dropt—

And died of sudden fright.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Work for a Tariff Commission

SECRETARY MACVEAGH, in June last, speaking at a banquet in Chicago concerning tariff revision, said:

"The main point is to satisfy the people of the Middle West. If they are not satisfied, then the tariff question will unfortunately not be out of the way, and we shall not have a clear field for carrying on reform."

There is abundant evidence that the people of the Middle West are not satisfied. Their attitude toward the new tariff is like that of Senators Cummins, Dooliver, Nelson, La Follette and others who voted against it. But it does not follow that they will strive to prevent the enactment of any good bill for the promotion of currency reform, or that their displeasure will endanger Republican control of the House at next year's congressional elections. The Republicans of the Middle West are as a rule sturdy partisans. Their dissatisfaction will not lead them to vote for Democrats, and it may be added that the course of Democrats in the Senate does not convince complaining Republicans that the Democratic party can be expected to support a sound and consistent tariff policy. These Repub-

licans would say, with Senator Cummins, that "the tariff law is a Republican law and superior to any that could be framed by Democrats."

We do not look for any revolt in the Republican party on account of those provisions of the new tariff against which the so-called insurgents made their vigorous and memorable protest. The people are weary of tariff discussion. In Congress other questions will soon engage their attention, such as currency reform and the President's plans for corporation control. But the faults of this tariff revision ought not to be forgotten by the people, and efforts to correct them should be made.

Senator Cummins would keep up the fight within the party by striving in every convention to procure the nomination of "men who will stand absolutely by platform pledges." He has in mind, of course, his own conviction that his party has been false to the pledges made in last year's national platform. But how can its failure to act in accordance with that platform be proved when there is no authoritative collection of facts by which the general assertions of the platform may be measured? Tariff protection, the platform said, should equal the difference between the cost of production at home and the cost of production abroad, plus a reasonable profit for the domestic manufacturer. Where is the evidence showing what these production costs are? It does not exist in any authoritative form. And therefore one man may say that a certain tariff duty exactly meets the requirements of the platform, while another may say that it does not, and neither can prove that he is right.

What is needed is an official commission of expert investigators who will ascertain just what the differing costs of production are, and who will give to Congress and the public, by authority of the Government, the results of their inquiries. We do not overlook the fact that Senator Cummins insists upon the appointment of such a commission, saying that revision of particular schedules should be made from time to time, as suggested by the commission's work. But until such a commission exists, and until a part of its work shall have been

done, the official proof to convict any legislator of a wilful disregard for the Republican tariff platform will be wanting.

Such a commission should be required also to make reports as to the sales of American protected products abroad at prices far below those which our own people are required to pay. Good work in this field has been done by the New York Reform Club, but the significant facts should be laid before Congress and the public by Federal authority.

Senator Hale asserts that the paragraph of the new tariff law which authorizes the President to employ experts to assist him in enforcing the law was purposely so worded that it does not authorize the employment of them to ascertain costs of production. He and many others desire to prevent an official inquiry concerning those costs. But the President has quite as much knowledge of law as the Senator from Maine has acquired, and he does not agree with him about this. In the statement which he made after signing the bill he said:

"The authority of the President to use agents to assist him in the application of the maximum and minimum section of the statute, and to enable officials to administer the law, gives a wide latitude for the acquisition, under circumstances favorable to its truth, of *information in respect to the price and cost of production of goods at home and abroad* which will throw much light on the operation of the present tariff and be of primary importance as officially collected data upon which future Executive action and Executive recommendations may be based."

Those agents are soon to be appointed, and we are confident that they will be required to ascertain the costs of production at home and abroad. There has been no official investigation of this kind since the inquiry made concerning the labor costs of certain products by the late Carroll D. Wright. His work indicated what the results of a comprehensive investigation would be. We believe that if Mr. Taft's agents, or a tariff commission, should make such an investigation, and if the tariff should then be revised in accordance with the requirements of the Republican platform, certain duties alleged to be fairly protective would be removed and others would be largely reduced.

Having made such a platform, the Republican party should not refuse now to provide for procuring, by official authority, those essential facts by means of which it can be intelligently and justly enforced in tariff legislation.

The Ways for Peace

WE have already spoken of the Catalanian riots in protest against the war with Morocco. Without discussing at present the occasion for that war, or the necessity of protecting a nation's citizens in a barbarous country, this popular protest, amounting almost to civil war, raises the question how war is to come to an end at last.

There are two forces now combining for peace. One is that of the rulers and representatives of the people. Czars and kings and presidents and legislations are planning from above. They meet in the Hague Conferences. They devise treaties of arbitration. They are doing a noble and useful work. To be sure they have to be guarded and must watch each the interests of their own country. Hence the difficulty in distinguishing between those questions which can be safely left to arbitration and those which are so vital to the integrity of the country that they cannot be arbitrated. We have not as yet a model treaty of arbitration presented to the nations. We are making progress, indeed good progress, but the positive end of war is yet far off. We cannot yet agree on the representation of the larger and smaller nations in an international court. So far off is universal peace that the rivalry for naval armaments is piling up taxation and almost resulting in national bankruptcy. Nevertheless the movement of the rulers for peace is of high importance. It is the greatest political influence for human advancement that the last two decades have seen.

But this is not all, and is not enough. The people rule, in the end, and not the rulers. The people must themselves forbid war or war will not cease to be a curse to the world. War comes, usually, because the people want it. A mad passion for war smites a people; or, it may be, a serious and solemn purpose determines that they must fight to achieve

what they believe to be a righteous principle or national defense. War will not end until the people will it to end. They must be educated to detest war and love peace. They must cease to regard war as the noblest of professions and the military leader as the grandest hero.

There is a story, "The White Crown," published fifteen years ago, telling how war came to an end. A mysterious stranger—was it the Prince of Peace?—moved among the people, the soldiers, the generals, and won them to the pledge not to slay in war. So when the army of Germany met the army of Russia face to face every soldier and officer, all but the Kaiser and the Czar, had taken the vow of the white crown, and when the orders were given to join battle all refused to shoot, and so war ended. The story is as preposterous as it is thrilling, but it tells its great lesson, that war is to come to an end and peace rule the world when the people will it so.

In Spain the people have refused to enlist in the army. In Russia there is a sect of Christians who refuse to fight. In France, in Germany, the two countries most hostile to each other, the labor unions fraternize and declare that brotherhood is more than patriotism, when the latter is subverted to slaughter. The ethics of Socialism forbid war. Socialists in Europe are banded against it. Not yet are they able to refuse to enter the army, for they are not yet as well instructed or as doggedly right as are the Russian Stundists, but they are getting stronger and fuller of purpose. The Churches, which have been agents and defenders of war, are learning new truth and duty, and are more and more protesting against it. Was not their Christ harbingered with the song of "Peace on Earth," and will they not learn the lesson? Business, trade, all the complex forces of modern civilization which are controlled by the common people, are for peace and quiet and prosperity. They all make for the abolition of war.

So it is that war must end. The rulers lag somewhat in their plans for arbitration. The people are slow to forget the miserable glories of war, but these two forces are uniting and the end is sure and not so far off as the generals and admirals think.

The Social Side of Farm Life

LAST week we discussed the purely agricultural aspects of the report of the Country Life Commission. This week we discuss the social side of the question. First of all the labor problem is crowding upon us with a demand to be solved. The difficulty of securing good labor has become so great that many farmers are disposing of their property, or leaving it to be worked on shares by tenants. It is not desirable that proxy farming shall increase in the United States. If our annual immigration could be fairly distributed it would pretty well cover the increase in the demand for help on our farms. Or if the native supply could be so educated as to prefer country life and outdoor work, we should hear little about the dearth of help during the harvesting seasons. Annually the cry goes out that our Minnesota wheat fields cannot be reaped and that the Kansas corn cannot be harvested. We do not know just the proportion of our grains that are wasted from defective and short handling, but it has been estimated at one-fifth of all the products of the United States.

The Commission concludes that under present conditions there is no remedy for lack of laborers but to change the style of farming. This change consists in a simplification of the business, and less activity and aggressiveness. In the Northeast the tendency is toward a maximum of grazing and meadow, and a minimum of hand labor. Of course the use of machinery is greatly increasing and largely displacing the demand for "hands." The final remedy, however, must lie in what we have come to term intensive farming. Here the requirements for help can be minimized because the acreage can be made very small, while yet securing a good income. That the hours of labor on farms can be shortened as suggested by the report we do not believe. It is impossible to carry on good land tillage unless the farmer knows the top of the morning, and he must be willing to find his pleasure in work rather than in the escape from it. What we need is a training that will make achievement satisfactory. Of course we do not argue for that sort of

labor which breaks down the worker; but we believe that with better tools and less back-breaking toil, the farmer still has a plump ten hours or more of activity. With wiser schools and a proper public sentiment, it surely would not be necessary to report that foreign labor is more reliable than American. Yet we understand that the commission is right in saying that foreign farmers are gradually taking possession of vast agricultural sections, and it may be true that they will in time drive out the native stock.

The position of the farmer's wife has changed so fully within the last fifty years that it is hard to place her. It is impossible any longer to secure for her that sort of neighbor help which was once common. Farmers no longer swap work in raising bees, husking bees, quilting bees and all other sorts of similar social contrivances. Schooling deprives the farm woman of her daughters, and education does not send them back again to help her in the household. Here is a huge blunder, either in our household economics or in the school system. The house-mother is left to provide food that requires the least labor, to satisfy herself with narrow social diversions and spend her days longing for town comfort. The commission suggests that we have gone so far in the way of creameries and other coöperative reliefs that we should go still farther to lighten the burdens of household labor. This does not, however, touch the problem of creating a new race of farm-mothers capable of managing the improved farmhouse and glorying in country life. Electricity will probably soon furnish not only light and heat but do a good deal of the work, and already the farm-wife has her telephone and free mail delivery.

Socially, farm life depends for its satisfaction largely upon the hygienic conditions established. Theoretically it should be the most healthful place to be found; far ahead of the average city home. But as things are health conditions very much need looking after in our open country. There are cellars undrained and full of pollution; stables and barnyards that are shameful and dangerous; unwholesome and badly pre-

pared food; stupidity and ignorance as to recreation, and in many sections there is a prevalence of local diseases. Infection from diseased cattle or from poisoned streams has to be constantly guarded against. The loss to the people from insanitary conditions on the farms is reported to be an enormous sum. Hygiene and sanitation should be taught in the schools, for no one more needs than the farmer to be taught how to eat, the importance of pure air, the necessity of caring for the body, and the ineffectiveness of drugging the system. The commission recommends that women organizations be formed for the purpose of providing visiting nurses for rural communities. What is needed is not so much a doctor for a patient as a regular supervision of rural families to make the attendance of a physician unnecessary. The report urges further that the Federal Government should be given a right to send health officers anywhere and at any time to investigate conditions and secure public health. This is a startling proposition, but we do not see why the Government should not be permitted to do for its citizens what it is already doing for its cattle.

Realizing that the success of country life always has been dependent and always will be dependent on the country woman, very largely, the Commission has made special effort to give us a thoro report along this line. It reports that good gardens and attractive premises and a sympathetic love for nature as a national characteristic are growing. Many farm houses are well provided with books, periodicals and musical instruments. But since the passage of household industries very largely to factories, such as cheese making, weaving and knitting, soap making and candle making, woman's life has been dulled into routine. She has mainly to mend garments and to prepare three meals a day, leaving her life more monotonous and isolated than in the old-fashioned farm days. In other words, the woman's lot is not as desirable as that of the man under present conditions. The Commission suggests a coöperative spirit in household affairs, meaning, we suppose, that the men and the women shall work together more than they do in field and

house. In this way the man does the harder work, while the woman has a part of the charm of the hay field and the garden. Other methods for relieving the woman should be good cisterns and wells, providing running water in the house, convenient gardens not stingily provided with flowers, telephones and improved roads. Women's organizations are springing up everywhere, including reading clubs and rural art associations.

Here and there the Commission has found a rural neighborhood in which farmers and their wives come together for social intercourse, and for this reason they approve very strongly of the working grange. The absolute independence and free range for personal will on the farm does not fit farmers for easy co-operation in any direction. Just exactly where the executive worker must yield his views of methods is not easy for him to determine, and for this reason the grange work is exceedingly valuable and educative. We still lack the cohesion that marks the farm folk in older countries. The training of generations has made the farmer a strong individualist, and his work brings out self-reliance as the essence of his nature. The Commission believes that the coöperative tendency must be encouraged. It is suggested that while recreation should be a feature of country life, it should be developed from native sources rather than by the invasion of some fashionable game from the cities or the towns.

But in no direction are we led by the Commission with more decisive emphasis than in the direction of improved rural schools. "In every part of the United States, there is but one mind, on the part of those capable of judging, as to the necessity of redirecting the rural schools." There is a demand that the schools express the daily life of the people and fit the young folk to engage intelligently in matters that concern the home. The schools must represent and stand for the community that supports them. It is urged that the teaching be visual and always applicable; that is, usable. If a boy can study in the morning something that he can use in the afternoon he understands what study means, and he will like it. Within

the last few years the colleges of agriculture have organized the State, very largely from the practical viewpoint, and they have much more still to do; but the departments of education must now coöperate. To industrialize our system does not mean to take out its culture and broadening power, but to make that more evident in a workable education that illuminates the boy's surroundings and the girl's home life. The Commission recommends a nation-wide extension work of the agricultural colleges. It would have the Bureau of Education become a clearing house, and a collecting, investigating and distributing organization; but this THE INDEPENDENT has already urged editorially. We heartily second the Commission, and are convinced that our Department of Education must unify the educational efforts of the United States.

Prices and Taxes

IN his interesting and exceptionally suggestive "Memories," Francis Galton repeats the story told of a Cameron of Lochiel who, bivouacking with his son in the snow, noticed that the youth had rolled up a snowball to make a pillow. Kicking it away he sternly said: "No effeminacy, boy."

For the favored of fortune these are days of effeminacy and worse. Costly self-indulgence, vulgar display, freak dinners, barbaric feminine costumes invented for the sole purpose of raising the bills of milliners and dressmakers, these are *de rigueur* things among people who have been overtaken by a golden flood and have not yet learned how to float on it gracefully.

But for the masses of humanity there will be little chance for extravagance or effeminacy if the present tendency of prices and taxes continues. Both are going up out of all proportion to middle class and working class incomes. *Bradstreet's* announces that prices are now up to the highest recorded level, and it is certain that they will go higher. Gold is still the monetary standard of the civilized world, and the enormous production of gold in the last ten years has cut down the purchasing power of that beautiful gold dollar of the McKinley cam-

paign nearly one half. In other words, the consuming community has come to a practical experience of that "fifty-cent dollar" which was the political ogre of 1896.

As if this were not enough, each of the big nations has been imposing new taxes, and of course, in the good old orthodox way, for the most part. The well-to-do, who could pay taxes without distress, have an undisguised horror of assessment, but they can always see the reasonableness of imposing new burdens upon people of moderate means or of no means at all. Financial burdens encourage thrift, or, if they don't, they increase the proportion of the population that can't get ahead enough to cross the boundary which is supposed to separate wage-earners from that admirable and "independent" middle class, which is understood to be the substantial element in national life. This difficulty, as anybody can see, tends to maintain an ample supply of wage labor and to prevent wages from rising at an alarming rate to correspond with advancing prices. All of which is "nice" for the people that want to employ an army of wage workers and would dislike to see a "socialistic" policy adopted whereby their own assessment for the common good might be perceptibly increased.

It is the bold departure from the orthodox scheme of things which makes the new British policy so sensational and so interesting as an experiment to be watched. The idea of imposing taxes on people that are able to pay them and spending them for the well-being of the multitude is reprehensible and alarming to the conservative mind. If a nation once starts on such a course as that no fellow can predict how far it may go. It might even arrive at an attempt to establish something like equality before the law.

The Chancellor of the Exchequer may be said to have added insult to injury, when, in reply to the wrathful attacks of the property owners who wanted to know if he was trying to drive industry out of the United Kingdom for good and all, he asked his critics where industry would go to escape its impending doom. It would be good news for the human

race if it could be announced that the new taxes taking effect in the nations of Continental Europe, and the new protective tariff in the United States, would in fact hit property as the British budget inevitably must. Unhappily they won't. They are of the orthodox kind. The new German taxes fall directly upon the "ultimate consumer." For example, ten boxes of matches which hitherto have cost two cents in Germany will now cost six. In the same country coffee, which has been twenty-five cents a pound, will cost fifty cents. Tea is advanced forty per cent., tobacco twenty to twenty-five per cent., and beer a cent a glass. In the United States new taxation, as always, will fall on the ultimate consumer, not directly but ultimately.

Whatever may happen in England, in the rest of the western world we are going to see for a long time to come not any tendency toward an equalizing of economic conditions and well-being. Under rising prices and rising taxes a marked increase of disparity will continue. The wealth of the wealthy will pile up. The deprivations and economies of the poor will afford them abundant exercise of the economic and moral virtues. Inasmuch as the poor and the relatively poor—the wage-earners and the middle class—greatly outnumber the inordinately rich, we suppose that it is legitimate to conclude that the present orthodox policy in taxation is maintained because the bearers of the burden fear that somehow or other they would go to the bad if, betrayed by a gleam of intelligence, they should shift it to other shoulders.

The Development of the Modern Myth

It is quite too easily believed that the day of mythopœia is past. Not at all. It is in human nature to make myths. Children all do it. Who does not know children who go off by themselves, or in company with others, and create imaginary stories which they half believe? It is the more or less conscious creative faculty within them, which, as they grow older, they control, but which, Wordsworth would tell us, brings them nearer

the world of angels, and the loss of which Thomas Hood laments:

"It was a childish fantasy,
But now 'tis little joy
To know I'm farther off from heaven
Than when I was a boy."

But there are those who retain to mature years the mythopœiac faculty, who allow their faculty of imagination to control their scientific judgment. The myth they create will expand itself under their elaboration, and may even find a considerable school of believers, and this, too, in our present scientific age; for it is an interesting fact that this age of the Baconian philosophy finds not a few people who are quite incapable of reaching up to it.

Under the irony of fate Lord Francis Bacon himself is an example of the development of a fine modern myth which has a coterie of active believers and advocates. The myth began with somebody's wonder that the unknown Shakespeare could have created the most extraordinary literature in the English language. The next stage was to declare that he could not have written his poems or plays, but that they must have been written by some other recognized man of fame and genius. Then it was easy to select Francis Bacon as their author. Then came the search for cryptic evidence that he wrote them, a search which has filled volumes of diligent and learned trifling. This succession of studies forms the first stage in the myth.

Now comes another which occupies a fresh school of myth-makers, all absolutely honest, ready to risk reputation or life on their faith.

Who was Francis Bacon? they ask, and they find a fine answer. He was the son of Queen Elizabeth, and his father was her favorite lord. Why not? He must be accounted for, as well as Shakespeare. But is it not incredible that Queen Elizabeth, ever in the public eye, could have borne a son and nobody have known it? Not at all. No difficulty is too great for one who wants to believe. At a suitable date, we are told, Elizabeth was sick for two months, with smallpox, it was related, and she recovered and her face was not pitted as every one's else was that had the disease. That is satisfactory evidence that she was the mother of Francis Bacon; or, if other

evidence is required, the same faculty which found cryptic proof in the plays themselves, in the order of odd letters in the first edition, is capable; and has proved itself capable, to supply all needed historical evidence. Books are written; a serial magazine is devoted to the propagation of the new faith. A school of believers is enlarging the story, which now might almost be called a cult. The believers know where conclusive evidence is hidden which will utterly confound all skeptics, Bacon's written claims, and gold hidden with it all, if only Parliament will allow them to open the vault. The myth has well developed and will continue to grow and find its disciples. The evidence of the impossible, the incredible, is made convincing.

How can it be? How is it done in this age of science? The answer is simple. A man's imagination runs riot, as in dreams, without the control of reason. Dreams seem real because neither the five senses, nor the sixth, test and control the fancy. It requires very little evidence, or none at all, in such a case to create belief, or even originate a myth. We give another example, fortunately where the myth has gained no such currency.

An excellent scholar living in New Haven, Conn., Mr. McWhorter, published an inscription of several lines in length, in the Phenician language, which he had discovered on the thigh of the Cardiff Giant, which was exhibited about the country several decades ago. It told how Phenician mariners, in the dated reign of a Sidonian king, had been driven by storm to this unknown land and had made this statue as a memorial of themselves. It was a remarkable inscription, all correct paleographically and historically. Now the Cardiff Giant was a humbug and fraud and proved to be such, having been made and buried and disinterred by the man who exhibited it. It could not have been made by Phenician castaways. But the inscription was in good Phenician. Equally it was impossible that the ignorant man who carved the statue could have concocted the inscription. Mr. McWhorter, who had found it, was a man of both honesty and scholarship. How could the impossible be accounted for?

In just this way. There was no in-

scription on the giant's thigh, nothing more than the irregular pittings of the tools with which it was cut. But the New Haven scholar wanted to believe the statue old, and what more natural than that it should have been made by Phenician sailors? Then came the search for evidence. There was a mark that looked like a Phenician letter. That letter would fit such a word. The letters of that word he imagined he saw traces of; and one word suggested another, and one line followed another until the whole inscription was evolved and created in his mind, and projected on the statue, where not one letter existed. He published it, but fortunately it gained no such belief as did the more attractive Baconian myth.

What do we see now? Imagination not merely filling our bookshelves and flooding our magazines, and fakes filling our journals, deliberately written for pay, but imagination actually curing disease, and a philosophy promulgated which teaches us that what we want, what will be good for us, is therefore true. The myth is not dishonest. It represents the imaginative faculty uncontrolled, then run riot. Why not? Not every one, even in this age, has learned to see two things at once, the two sides of the shield, to practise stereoscopic vision, to use laboratory methods, to ask what is the evidence on the other side. It is easy for some people, and such there will always be, to believe what they want to believe.

An American Gift to Pius X

SOME American bishops, according to *La Stampa*, of Turin, have bought from the grandnephew of Pius IX the palace in which he was born at Sinigaglia, near the Adriatic Sea. It is said they intend it as a present to Pius X. Further news assures us that the deeds have been past over to Archbishop Farley, who is not yet a cardinal.

John Mary Mastai was born May 13, 1792, and lived in the family palace till he was eleven, save while being nursed by a peasant woman who lived on the estate. He entered the college of Volterra, but falling ill was obliged to leave. Again his poor health obliged him to resign

from the Papal Noble Guard, which he had joined. He was then twenty-two years old. This part of his life at the ancestral palace is the most discussed. He is charged with leading a pretty loose life and of actually joining the Freemasons, who had a lodge in the town. The parties now laboring for his canonization may have to overlook very much or recognize an Augustine in the Pope, who declared Mary's Immaculate Conception a heralded truth. Soon, however, Mastai left Sinigaglia and entered the Church. Over forty years were to pass before he returned. In 1859, now Pius IX, he wrote to his brother, Gabriel, announcing the Pontifical visit and requesting himself and family to vacate the palace and in a second letter the Pope stated that the Papal Court would require forty beds. Of the Court the most important was Mgr. Hohenlohe, Prince of the Holy Roman Empire and brother of the second successor of Bismarck in the German Chancellorship. He was to the end a staunch anti-infallibilist and is credited with the exprest wish to be Pope just for a day. In that twenty-four hours, he declared, he would throw up the Temporal Power, suppress the Jesuits and abolish celibacy. Then casting the Tiara into the Tiber he would return to his native Bavaria.

When in 1870 news came of the triumphal entry of Victor Emmanuel into Rome, Count Hercules, Pius IX's nephew, who was a captain in the Italian cavalry, brought the news to the palace, and while singing patriotic songs placed the Red, White and Green of United Italy in a vase full of flowers, standing in the reception room.

In 1892 Catholics of the town, in union with the hierarchy, wished to celebrate the centennial of the birth of Pius IX. A tablet with a suitable inscription was put into the wall of the palace. The eve of the celebration some anti-clericals covered the tablet with another bearing the legend: "Here was born John Mary Mastai, the butcher of Nonti and Tognetti and of his fellow townsman, Jerome Simoncelli." The proposed celebration was declared off.

Of course, it is as yet unknown what Pius X will do with this testimony of American episcopal affection.

President Taft's New Order

Not Theodore Roosevelt could have issued a more drastic order for the supervisors of the Census than that issued by President Taft forbidding the use of the Census machinery for political purposes. In his letter to the Secretary of Commerce and Labor he says:

"I therefore order . . . that any supervisor or enumerator who uses his influence with his subordinates or colleagues to assist any party or any candidate in a primary or general election or who takes any part, other than merely casting his vote, in politics, national, State or local, either by service upon a political committee, by public addresses, by the solicitation of votes or otherwise, shall be at once dismissed the service. I wish to make this regulation as broad as possible, and wish it enforced without exception."

Of course the effort will be made to evade this order. The President has to consult Representatives and Senators in selecting supervisors, and they are Republicans, except in the South, where the two parties divide the spoil. The supervisors appoint the enumerations, many thousands of them, and political interests will be sure to make their claim. But it is a great step forward to have a good law, after a bad bill was vetoed, and the definite prohibition to take any active part in politics. The old Jacksonian rule, that to the victors belong the spoils, is repudiated by a President who is making good the promise that there shall be no retreat from the progressive measures and policies urged by his predecessor.

Baron Takahira

Baron Kogoro Takahira, the Ambassador from Japan to the United States, returns home this week. Whether he will come back in the fall after having given his Government the benefit of his advice as to the renewal of the expiring treaty with us or whether, as has been intimated, he is to be promoted to the head of the Foreign Office, the Baron will carry with him the respect and admiration of all good Americans. Arriving at his post at Washington at the acute stage of the California insult and Hobson war talk period, he straightway with tact and statesmanlike vision set about to solve once and for all the difficulties between the two greatest Powers of the Pacific. Altho his predecessor was recalled for suggesting a similar plan he persuaded Japan to negotiate an arbitra-

tion treaty with us, in which all questions save those of "vital interests," "national honor," or those involving third parties were to be settled at The Hague. Tho this was the first arbitration treaty that Japan has ever entered into, the Baron was not content with the glory of bringing it about. He saw that as long as "vital interests" and "honor" were reserved for the arbitrament of war there were still chances for trouble between Japan and America. Accordingly the ink on the treaty was hardly dry when he set about negotiating with Secretary Root the famous "agreement" in which both nations pledged themselves among other things to respect each other's territory and sovereignty. Thus the treaty and the subsequent agreement bind Japan and America in a peace compact in which their territory and sovereignty can be the subject neither of war nor arbitration and all other questions are to be settled by arbitration. The treaty and agreement, therefore, taken together constitute the farthest step yet made by any two world Powers along the path toward Universal Peace. For this, above all else, the American people will ever hold Baron Takahira in grateful remembrance.

Compulsory Arbitration

New Zealand is in the midst of "hard times." Now is the chance, therefore, for the opponents of the Compulsory Arbitration act to show the dire results they have been prophesying for the past decade. "All very well in seasons of prosperity," they were accustomed to say, "Wait till the bad times come. Then the principle will be tested." Well, what is the situation? Mr. Tregear, the Commissioner of Labor for New Zealand, informs us that tho there is more unemployment than heretofore, and less profits are being made, there has been no reduction of wages, no shutting down of plants and no strikes, while "the fall in the public fortunes has been met by a rise in individual energy that has already gone to make losses good." We shall, most of us, doubtless shake our heads and argufy, but sooner or later we will follow New Zealand's example and compel capital and labor to settle their disputes by arbitration. And the movement will progress

just as fast as the public learns that it has even more vital interests in industrial peace than the other two factors in the case.

The Child Shah "Wo to thee, O land, when thy king is a child!" said the Preacher, but in the case of Persia popular sympathy is not so much stirred for the land as for the eleven-year-old lad who has been forced to become its ruler. The Peacock Throne is the most sumptuous in the world, but its occupant is as miserable as a boy at boarding school. Shah of Shahs and King of Kings is he, but he wants his mother. And she wants him, preferring to take him with her into exile rather than to leave him in his solitary grandeur. She has a divided duty; if she stays in Teheran she parts from her husband; if she goes into exile with the deposed Shah she loses her son when he needs her most. For, strange as it may appear to our notions, family affection is found even in the harem of an Oriental despot. The revolutionary leaders, who followed quickly after the Shah as he fled to the Russian Legation when the city was captured, found the blood-thirsty tyrant whom they had overthrown not concerned with his own fate, but engaged in sopping up with his handkerchief the tears of his wife, who had thought him killed in the street fighting. When the revolutionists asked him to grant them audience so they might give him formal notification that he had lost his kingdom, he replied—one may imagine with some gruffness—that they need not bother, he knew it already. Then, when they tried to take away the little Crown Prince to be their King, he added his tears to his mother's. But when he was told that it was against the rules to cry in the Russian Legation, he dried his eyes and went with them, a pathetic figure crouched in the corner of the big state carriage. When he reached the Sultanabad palace he received the homage of the Regent and public officials with boyish dignity, and in reply to their perfunctory expression of the hope that he would be a good ruler to his people, he spoke up loud and clear: "Inshallah. I will!" But youthful courage does not last. He found that the regulations of the Russian Legation did not prevent

him from indulging his grief in Sultanabad. When they let him go horseback riding he tried to run away, but a courtier overtook him, seized the bridle rein, and, drawing his revolver, threatened to shoot himself if the Shah did not return to the palace. He did return, but next day tried to escape by means of suicide. That also was prevented and the child Shah is condemned to be crowned and married within a few months.

Readers have noticed that we have not commented on ex-President Eliot's lecture on the religion of the future, or the New Religion, as the title gives it. We have great respect for Mr. Eliot, and know him to be a wise man, when he is not otherwise; and we hesitate to believe that the report that was published is full enough to base a judgment. He is more brave than wise if he thinks himself able to prophesy—and his address seemed to be mainly a prophecy—what is the substance of the new and different religion that will dominate the world. It is not easy yet to see that Christianity will be replaced by a new cult with new motives and new authority. Mr. Eliot warns critics to wait until they see his address in full in a few days.

It is well that the four protecting Powers will remove the Greek flag which the Cretans have raised over the citadel of Canea. The Cretans will not remove it, and they ought to be allowed to choose their rulers. But so long as Crete has all the advantage of self-government except the name, it is not worth while to provoke a war in which Greece's only chance to escape being crumpled up like paper by the Turkish army would be in the protection of the Christian Powers.

Ex-Police Commissioner Bingham says in *Hampton's Magazine* that he believes \$100,000,000 in graft is paid every year in New York, and a part of it was offered to him, \$10,000 a month to allow a gambling house to run very quietly, and \$5,000 cash and \$500 a month simply to be seen shaking hands with a proprietor of an upper Broadway café. With such evidence from an honest commissioner we may know what to suspect when the lid is off.

The Metropolitan and the White Plague

THE Metropolitan Life Insurance Company, of which John R. Hegeman is president, recently came to the conclusion that if it could prolong the lives of its policy-holders by curative intervention it would not only be going a good deed in a naughty world but it would likewise be legitimately exercising its powers. The company planned to erect a tuberculosis sanitarium on a land tract in the Adirondacks wherein its policy-holders and employees who became consumptives might have treatment without expense except the payment of annual premiums on policies held by them. The idea was certainly humanitarian, but Insurance Superintendent Hotchkiss has denied the company his required permission to acquire the needed real estate for the purpose, and in a somewhat lengthy memorandum he reviews the reasons put forth by the company in behalf of its right to invest its funds in such administrative real estate and summarizes the legislation of the State on insurance company investments since 1849. Mr. Hotchkiss contends that the law does not permit the kind of investment contemplated by the Metropolitan Life. He says in part as follows:

"A corporation cannot exercise implied powers which the statute, on which its charter rests, definitely withheld. The moment of its incorporation this company was prohibited by law from acquiring real estate except such as was requisite for its immediate accommodation in the transaction of its business. Save for what seem immaterial changes in the use or omission of adjectives, this prohibition has continued in force from that time. The purchase of lands for the purpose of erecting and maintaining thereon a tuberculosis hospital, even granting that in present-day conditions the functions of an insurance company have been so widened that maintenance by it of such a hospital is within its implied powers, is thus, to use the words of Justice Beekman, "otherwise prohibited." And this, too, irrespective of whether the hospital is for the sole benefit of employees or for the benefit of employers and policy-holders alike. Counsel for the applicant urges that, in view of the commendable purpose of his company, the question should be looked at broadly and the law liberally construed. But if this company can erect a hos-

pital for consumptives, where, pray, is the end? Another company may with equal propriety ask authority to erect a general hospital. Still another may confidently seek approval for the erection of a laboratory for the scientific investigation of disease. It is answered that the Department can be relied on to limit such expenditures, and prevent the extension of this new idea beyond bounds. The Department prefers, however, to act well within rather than possibly without the law. Hence, while appreciating the practical philanthropy behind the present application, the possibilities which lurk therein of the assumption by insurance companies of many functions not strictly incident to their business suggest that the State may well move slowly in determining whether its creatures, particularly those possessed of such enormous financial power, should be permitted thus to step outside their legitimate field. Still further, while courts in extreme cases of apparent injustice may sometimes properly strain after jurisdiction or stretch the written law, administrative officers should take the law as they find it and leave law making to the law-making power. The enlightened public opinion of the present day, particularly in a State whose Legislature meets annually, may be relied on quickly to find expression in new laws or approved amendments to old laws. Hence, if this interpretation of Section 20 (2) is not in accord with that public opinion, the Legislature of 1910 will doubtless grant the power which the Legislature of 1849 withheld."

THE Provident Savings Life Assurance Society, of which E. E. Rittenhouse, sometime Superintendent of Insurance for the State of Colorado, is president, has so far progressed that the company has now resumed the writing of new business. A published statement by the president says:

"The policy of the management will be to advance the interests of the society along conservative and economical lines. It will gradually enlarge its field of operation until it takes in practically all of the States in the Union. There will be no wild dash for business and no extravagance. The army of the uninsured in this country is sufficiently large to afford an ample field for all companies and the Provident will soon get its full share of the business."

THE Travelers, of Hartford, has given notice that it will not insure against accident those who insist upon riding in aeroplanes and flying machines. The growth and development of aviation has brought forth a new hazard and the Travelers will as yet have none of it.

Good Crop News

LAST week's crop report was distinctly favorable, as a whole, altho previous estimates of the yield of corn were slightly reduced. For winter wheat the Government gave its own estimate in bushels, and this was unexpectedly large. The grain trade had been looking for about 400,000,000 bushels, but the Government reported 33,000,000 more. This makes the entire crop something in excess of 700,000,000, a total which has been surpassed in only two years, 1901 and 1906. We shall have 40,000,000 bushels more than were harvested last year. The corn crop will be, in round numbers, 3,000,000,000 bushels, which breaks the record. Another record crop will be that of oats, exceeding last year's by more than 200,000,000 bushels. The totals are shown below:

	Indicated crop.	Harvested last year.
Corn	2,954,000,000	2,668,651,000
Winter wheat ...	432,920,000	437,908,000
Spring wheat ...	270,348,000	226,694,000
Total wheat	703,268,000	664,602,000
Oats	1,027,000,000	807,156,000
Rye	31,540,000	31,851,000
Barley	181,658,000	166,756,000

The total yield of these cereals exceeds last year's by 558,000,000 bushels or by nearly 13 per cent. North of the Canada line the harvest is now in progress, and there will be 130,000,000 bushels of wheat in the three Northwestern provinces. Wheat crops in Europe are reported to be about an average. Wheat reserves are low all over the world, lower, in fact, than they have been for many years. Our exports were reduced last year; in the coming year they will be increased, but not largely, for there will be an increase of the quantity consumed at home. Our farmers are favored, and their prosperity is the foundation of the prosperity of all. Abundance will probably prevent an advance of the prices of cereals, but the condition of the world's supply will not permit any considerable reduction.

Trade and Speculation

ADDITIONAL indications of the upward movement were seen last week in the steel industry and in purchases of railway equipment. For the first time in nearly two years all the departments of the Maryland Steel Company were running on full time. The Baltimore & Ohio road closed contracts for 3,600 cars and 30,000 tons of rails, and is planning to buy 2,000 more cars and 60 locomotives. These purchases call for more than \$10,000,000. The Pennsylvania road ordered 2,600 cars. An order for 57 locomotives was placed by the Hill roads at the Baldwin Works, where it is said that 20,000 men will soon be employed night and day. Reports concerning general trade were encouraging. In the stock market there were large transactions, notably in Union Pacific (which showed an advance of 14 points) and in Steel. The number of shares sold, 6,841,000, exceeded the preceding week's total by about 40 per cent. Dealings in Steel and Union Pacific securities amounted to more than 1,100,000 shares.

....About 11,000 men are now employed upon railway extensions in Oregon and Washington.

....Imports of wool in the last fiscal year were 266,500,000 pounds (about one-third of the quantity consumed in the United States) valued at \$45,000,000.

....The American Bank of Nicaragua, chartered in this country, has secured a fifty year concession for the establishment of banks in Managua and other cities of Nicaragua.

....Negotiations have been closed for the construction of a new union passenger station in Kansas City. The cost of it, with that of the allied system of freight terminals, will be \$30,000,000. The new station building, upon which \$3,000,000 will be expended, will be at Twenty-third street and Baltimore avenue, facing one of the city's finest parks.

The Independent

VOL. LXVII NEW YORK, THURSDAY, AUGUST 26, 1909.

No. 3169

Survey of the World

Mr. Taft and the Corporations

The principal subject considered at recent conferences between President Taft and certain members of his Cabinet has been a plan for perfecting both the executive and the legislative machinery for dealing with corporations. This will be the leading topic of his message to Congress in December. He has said that his aim would be to perfect the machinery by which the standards set up during the administration of his predecessor can be maintained without interference with legitimate business. The question has recently been studied by Attorney-General Wickersham and other members of the Cabinet. Their views and the results of their inquiries have been submitted to the President at Beverly. Press reports which, it is understood, were approved by the President, foreshadow action or recommendations on the following lines: There will be a movement for the relief of the Interstate Commerce Commission, involving a withdrawal of the commission's executive duties, which may be transferred to the Bureau of Corporations or to the Department of Justice, and a restriction of the commission's work to the quasi-judicial investigation of complaints made either by individuals or by an executive department charged with the duty of supervision. Legislation designed to prevent excessive issues of railroad stock or bonds will be recommended, and also legislation to prevent a railroad company from owning stock of a competing road. The plan will include a new distribution of the duties of those bureaus, in several departments, which are engaged in dealing with corporations. Mr. Taft said on the 21st that the desired amendments of

the Interstate Commerce law presented no difficulties, and that the proposed rearrangement or co-ordination of bureaus could readily be accomplished. A simple and effective method of preventing excessive issues of stock or bonds had been proposed. It is admitted, however, that amendment of the Sherman Anti-Trust law will not be an easy matter. It is desired that railroad companies shall be permitted to make traffic agreements, subject to the approval of the commission. This change may be made, but any modification of the Sherman act with respect to combinations or Trusts in the general field of production is found, so the press reports say, to be a very difficult problem. The President's views, together with those of certain members of his Cabinet, will be considered at a conference to be held in New York on the 30th inst. Attorney-General Wickersham, Secretary Nagel, Secretary Ballinger and Commissioner Knapp will be present, and suggestions will be received from financiers and other business men. A report will be laid before the President in November. He has heard that the new law for a tax on the net earnings of corporations will be attacked in the courts, and he is confident that it will stand the test. It is said that Mr. Wickersham is in favor of a national incorporation law as a logical sequence to the net earnings tax act. This act is sharply criticised by ex-Judge Alton B. Parker, formerly Democratic candidate for the Presidency. It seeks to accomplish by indirection, he says, what the Federal Government cannot do by direct action. It is dangerous, he adds, to empower a President at his will to publish or to withhold from publication the rec-

ords of a corporation's affairs.—William Cramp & Sons, of Philadelphia, are the lowest bidders for the construction of the two great battleships, the "Wyoming" and the "Arkansas," the bids being \$4,450,000 and \$4,475,000, but as only one ship can be assigned to a firm, the bid of the New York Shipbuilding Company, of Camden, N. J., \$4,675,000, will be accepted for the other. These will be the largest ships in the navy. The first so-called Dreadnoughts, the "Delaware" and the "North Dakota," were of 20,000 tons; the two now being constructed (the "Utah" and the "Florida") are of 22,000; but the displacement of those for which these bids were invited will be 26,000.—The Department of Justice is prepared to try Governor Haskell, of Oklahoma, upon the indictments in which he is accused of fraud in connection with his acquisition of town lots in Muskogee.

West Point Cadets Expelled

Seven cadets of the Military Academy at West Point were expelled on the 19th, by order of the President, for hazing Cadet Rolando Sutton in June last. The list follows:

John H. Booker, Jr., of West Point, Ga., first class; Richard W. Harker, Kansas City, Mo., third class; Earle W. Dunmore, Utica, N. Y., third class; Chauncey C. Devere, Wheeling, W. Va., third class; Gordon Lefebvre, Richmond, Va., third class; Albert E. Crane, Haverden, Iowa, third class; Jacob S. Fordner, Dothan, Ala., third class.

Sutton, a member of the fourth or freshman class (a "plebe"), was on sentry duty in the night, when he was attacked with tent poles by several cadets, and so severely bruised that he remained in the hospital three weeks. A board of investigation, whose presiding officer was Lieutenant Colonel Sibley, made a thorough inquiry, sitting for nearly a month and examining 135 cadets under oath, and upon its report the order of dismissal was prepared by Secretary Dickinson and promptly approved by the President. It is said that young Sutton's testimony showed no desire on his part to secure the punishment of those who attacked him and did not assist the board in identifying them. In a statement of their side of the case they assert that they were not hazing any one, but were merely "skylarking" when they

encountered the sentry, who ran after and tackled them, thus bringing on "a friendly scrimmage" in which he was hurt. They also express the opinion that their punishment would not have been so severe if President Roosevelt had not reinstated six of the eight cadets suspended for hazing and marked for dismissal last year.—On the 18th, at the end of a long and sensational hearing before a court of inquiry concerning the death, in October last, at the Naval Academy, of Lieut. James N. Sutton, of the Marine Corps, a brother of Cadet Sutton, the verdict was that death was "self-inflicted, either intentionally or in an effort to shoot one of the persons restraining him." This had been substantially the decision of another court of inquiry, announced shortly after the event. Lieutenant Sutton's mother caused a second investigation to be made, asserting that her son had not killed himself, but had been shot by his associates. There was a quarrel among the young officers in the night, and Sutton's companions threw him on the ground and sought to disarm him. Two were slightly wounded before Sutton was killed. The president of the court, Commander Hood, severely criticises the lieutenants who were with Sutton and speaks of a discreditable lack of discipline in the Marine School of Application at the time. The Navy Department, approving the court's decision, expresses its disapproval of this "lax state of discipline."

Trust Suits

In Arkansas, the State authorities have brought suit against the American Book Company, alleging that it is an unlawful combination in restraint of trade. They ask that the company be forbidden to do business in the State and that fines amounting to \$2,000,000 be imposed. The same authorities have sued sixty-five insurance companies for violation of the State's Anti-Trust law, asking that their licenses be canceled and that a penalty of \$1,000,000 be collected from each defendant, or \$65,000,000 in all.—The Waco-Kramer Tobacco Company, of Norfolk, Va., has brought suit against the American Tobacco Company, or Tobacco Trust, asking for damages in \$2,400,000. The plaintiff company, which manufac-

tures cigarettes, alleges that the Trust has sought to ruin its business, following a threat that it would accomplish such ruin unless F. D. Kramer, the head of the company, should cease to manufacture cigarettes and should accept a position in the Trust at a salary of \$10,000. — In New York City August F. Grimm and six other meat dealers have sued Armour & Co., Swift & Co. and the National Packing Company under the Sherman act, asking damages in \$2,175,000. They assert that the defendants are practically a Beef Trust and that this Trust unlawfully suppress competition in New York by obtaining control of the Butchers' Dressed Meat Company, which the plaintiffs and certain other dealers established in 1907 as an independent concern, intending by means of it to escape the alleged exactions of the defendants.

Labor Controversies

In a battle between the strikers and the mounted police, near the factories of the Pressed Steel Car Company at McKee's Rocks, Pa., on the night of the 22d, five men were killed and at least a dozen fatally injured. There had been riots at McKee's Rocks almost every day since the beginning of the strike, six weeks ago, and several persons had been killed, but this battle on the 22d was by far the most serious engagement in the history of the bitter controversy. During the day several attempts to wreck the factories with dynamite were made, bombs were thrown at the police by strikers' wives, and Dr. Davidson, one of the company's physicians, was shot twice as he was leaving the mills, receiving wounds that may be fatal. At night the strikers were searching street cars for strike-breakers. In one of the cars they found Harry Exler, a deputy sheriff. Knowing that he had served as a strike-breaker two or three years ago, they attacked and killed him. When the State troopers, or mounted police, arrived, the battle took place. One trooper was shot to death and four received mortal wounds. The dead bodies of three unknown men, believed to be strike-breakers, were found. Four strikers will die of bullet wounds, and it is thought that the dead bodies of several

strikers were carried away by their friends. The company asserts that it now has in its mills 2,000 strike-breakers. The Austro-Hungarian Consul has filed in the Federal Court a complaint that many of these were procured by deception and are retained within the enclosure only by force.—The New York Central Railroad Company has decided to move its Pittsburgh & Lake Erie shops from the vicinity of McKee's Rocks to Ohio, owing, it is stated, to annoying contests with labor unions. In the shops 1,400 men are employed. Many of these own their homes and have been in the company's service for years.—At New Castle, Pa., the American Sheet and Tin Plate Company has sued fifty-six prominent strikers, asking \$200,000 in damages, and alleging that the defendants have caused a loss of so much in profits by preventing 3,000 men from working.

Our Pacific Islands

The four leaders of the recent strike of Japanese laborers on the Hawaiian plantations, indicted for conspiring to incite riot and the destruction of property, were found guilty by a jury on the 18th. Each was sentenced to be imprisoned ten months and to pay a fine of \$300. The convicted men are Makino, president of the Higher Wage Association; Soma, editor of the Japanese paper *Nippu Jiji*, and Negoro and Tashaka, assistant editors of the same paper, which was the organ of the strikers. Mori, the Japanese who attempted to assassinate Sheba, the editor of the *Shinpo* (which opposed the strike), admitted that he had been moved to commit this crime by the *Nippu Jiji*, which argued that Sheba deserved to be killed.—It is expected that the new tariff law will promote the growth of Manila as a commercial port because it provides that Philippine products shall be admitted at our ports free of duty upon condition that they are brought directly from the islands. It has been the practice of many Philippine exporters to ship goods for this country on tramp steamers to Hong Kong or Shanghai, where they have been transferred to steamships going to San Francisco or Puget Sound. The Treasury Depart-

ment decides that upon goods so transhipped the full duties must be paid. It is predicted that this decision will cause the establishment of new steamship lines making direct voyages from Manila to the Pacific States.

The Situation in Mexico

Unrest in northwestern Mexico continues to excite apprehension at the capital, and it is said that President Diaz may not be able to meet President Taft at the boundary in October. It was planned that Mexico's President should call upon President Taft in El Paso, Tex., and that immediately afterward President Taft should cross the Rio Grande and call upon President Diaz in the village of Ciudad Juarez. On the 19th, General Bernardo Reyes, Governor of Nuevo Leon, and the candidate of those who oppose the re-election of Vice President Corral (the choice of President Diaz), retired from Monterey to Galeana, a resort in the mountains. To this place he was at once followed by Federal troops, under the command of General Trevino, and when he went from Galeana to a neighboring ranch he was again followed and surrounded by this military guard. He was not present in Monterey at the public celebration of his birthday, on the 20th, when a collision with Trevino's troops was expected. There was no disturbance, however. Trevino would not permit military bands to take part in the public exercises. Several regiments have been sent to him from the south, and he now has at his disposal 9,000 men, whom he has distributed at the places where there is danger of an uprising. The importation of arms has been forbidden, and even Americans crossing the boundary on hunting trips have been obliged to give up their guns. There is no proof that Reyes has been stimulating the activity of his supporters, who are called Reyistas, and the prevailing opinion is that President Diaz has the situation well in hand.—It was reported on the 17th that the Peruvian Minister at La Paz had informed President Villazon that within two days Bolivia must decide whether she would accept or reject the Alcorta award. Two days later reports came to our State Department from Argentina,

Peru and Bolivia that Peru had sent to Bolivia an ultimatum on this question. There has since been published, however, a denial which appears to be authoritative, and it was asserted on the 21st that, owing mainly to the good offices and influence of the United States, a peaceful settlement of the controversy was assured.

Cuba There has been an attempt to make a permanent fusion of the two factions of the dominant party (the Miguelistas and the Zayistas), and Señor Zayas has been elected chairman of the combined forces. Utterances of the press, however, indicate a lack of public confidence in the fusion movement.—A report was in circulation last week that our Government had asked President Gomez to recall General Garcia Velez, the Cuban Minister at Washington. Officers of our State Department said that it had no foundation in fact. Minister Velez had a conference with President Taft last week. He is to make an address at Denver on September 9, and another a few days later, at the Exposition in Seattle. It is understood that his purpose will be to defend the present Cuban Government and to show that it has been unjustly criticised.—There has recently been much vague talk in the Cuban press about an impending political crisis, with probability of intervention by the United States. The record of current events does not indicate any serious disturbance.—It is announced that George W. Young & Co., bankers, of New York, have undertaken to refund the national debt of Guatemala and place the currency of the country on a gold basis. The debt is said to be about \$12,000,000.

The Debate on the Budget

The Government has achieved a signal victory in the passage of the finance bill thru the Committee of the Whole of the House of Commons by a substantial majority. The bill was of such a radical character and made such a direct attack upon the privileged classes by its land taxes that it met with furious opposition which at first seemed likely to prevail. But the members of the Cabinet,

departing from the usual custom, appealed to the people by stirring speeches at mass meetings in various parts of the country, and public sentiment rallied enthusiastically in support of the measure so that the Opposition in the House of Commons lost heart and became perfunctory. It is a question whether even the House of Lords will dare to reject it. Constitutionally the Lords have no right to interfere with a financial measure and, if by assuming that this bill has for its aims not so much the raising of revenue as the equalization of property, they throw it out for the purpose of forcing an election, the Government may refuse to accept the challenge and resort to the ultimate expedient of creating a sufficient number of new Liberal peers to pass the bill. The Government speakers had the best of the argument in that the Opposition could not deny the necessity of greater revenue. In fact, they had increased that need by demanding the building of four more Dreadnoughts, and they had no alternative to offer except "tariff reform," which in England means the establishment of a general tariff. The Liberal leaders laid stress upon the fact that the proposed duty on increased land value was not a tax upon any property now in existence or upon anybody's earnings, but upon an unearned increment of the future due to the community as a whole. They gave specific instances of such cases, preferably choosing as their horrible examples the great ducal landlords. One of the most effective of these illustrations was "the famous Gorrington case," stated by Mr. Lloyd-George, Chancellor of the Exchequer, in these words:

"Mr. Gorrington had got a lease of the premises at a few hundred pounds a year ground rent. He built up a great business there. He was a very able business man, and when the end of the lease came he went to the Duke of Westminster, and he said, 'Will you renew my lease? I want to carry on my business here.' He said, 'Oh, yes, I will, but I will do it on condition that the few hundreds a year you pay for ground rent shall in the future be £4,000 a year.' In addition to that he had to pay a fine—a fine mind you!—of £50,000, and he had to build up huge premises at enormous expense according to plans submitted to the Duke of Westminster."

All that the Duke of Westminster could find to say in reply to this was:

"Whilst I should be disposed in other circumstances to attach importance to every utterance coming from a Chancellor of the Exchequer, the traditions of that great office have become so far submerged under the personal idiosyncrasies of the present occupant that a person attacked from that quarter should find all that is necessary in the way of defense in the fairness and sense of decency still inherent in the community."

Mr. Lloyd-George showed how the community suffered from land monopoly as well as individuals by this instance:

"The town council of Richmond recently built some workmen's cottages under a housing scheme. The land appeared on the rate book as of the value of £4, and being agricultural the landlord only paid half the rates, and you and I paid the rest for him. It is situated on the extreme edge of the borough, therefore it is not very accessible, and the town council thought they would get it cheap. But they did not know their landlord. They had to pay £2,000 an acre for it. The result is that instead of having a good housing scheme with plenty of gardens, of open space, plenty of breathing space, plenty of room for the workmen at the end of their days, forty cottages had to be crowded on the two acres. Now, if the land had been valued at its true value that landlord would have been at any rate contributing his fair share of the public revenue, and it is just conceivable that he might have been driven to sell at a more reasonable price."

The Opposition denounced such attacks as demagogery of the worst kind and showed that the profit was not unusually large in these cases, that it did not all go to the landlord, and that the Government in its sales of land took the same advantage of the rise in values. The Government speakers, however, had no difficulty in making plain that all these statements, if true, did not break the force of the argument.

Modifications in the Bill The Government was obliged to make some important changes in the finance bill in consequence of the criticism to which it was subjected. One was that the determination of the present land values shall be made by the State instead of at the cost of the owner as at first proposed. This will be a delicate and expensive process, costing, it is estimated, about \$10,000,000, more than the tax will bring in the first year. The Opposition made the most of this concession, ridiculing the idea of a revenue measure that would cost more to collect than it would produce. The Opposition by

calling attention to the impossibility of determining the value of undeveloped mineral deposits forced the withdrawal of the clause for their valuation. A tax on mining royalties and rents was substituted. As a concession to the labor supporters of the Government the lands of the benevolent societies were exempted from the new taxation. Their value is calculated at \$500,000,000.

The Greek Flag in Crete

The four protecting Powers—Great Britain, Russia, Italy and France—have assumed complete responsibility over Crete and have requested Turkey to leave the matter entirely in their hands. Any further interference on the part of the Porte would be likely to make the matter worse and not advance the Turkish interests, which the Powers have been careful to safeguard. Their joint note also suggests that Turkey should refer any questions in regard to Macedonia to the Powers signatory to the Berlin Treaty and lay before them any grievances. When the Cretan Cabinet resigned on account of its refusal to lower the Greek flag at Canea, a Provisional Administrative Committee was appointed to take charge of the Government in the interregnum. This committee, however, immediately showed its sympathies were on the same side by taking an oath of allegiance to the king and kingdom of Greece, and took no steps to remove the Greek flag, consequently the Powers were obliged to take action. A combined party of marines from the four foreign vessels in the harbor of Canea, landing on August 18, brought down the flag. On the following day it was again hoisted by a mutinous company of militia and was protected all day by a mob of people, but at night the Governor and a party of orderly citizens removed the flag and mast, promising that it should not again be raised.—The Turkish Chamber of Deputies has granted a concession to an American syndicate for the construction of a railroad in Asiatic Turkey from Sivas to Lake Van, near the Persian frontier, a distance of 1,250 miles. The company will have sixteen months to

study the route, and in case no more advantageous offer is received by the Government in that time, the franchise will be granted to the American capitalists. This road parallels to the northward the German railroad across the Euphrates Valley, and may be extended into Persia and even to India.

The Spanish in Morocco

It is probable that General Marina has begun an advance movement on a large scale against the Moors of the Riff Coast, but this opinion is based less on authentic reports from the scene of war than from their absence. A military censorship of the strictest character has been imposed at Melilla and the fifty-eight newspaper correspondents are allowed to report only insignificant skirmishes. Great difficulty has been experienced in the landing of troops and supplies because of the impossibility of bringing large vessels near to land, the lack of boats and the attacks of the Moors. A channel is being dredged in the enclosed harbor to the south of Melilla in order to facilitate landing of supplies and also to enable gunboats to be brought close to the shore to support the military operations. In the meantime the Moorish forces are being continuously augmented by the arrival of more tribesmen, and they have greatly strengthened their positions on Mount Gurugu and other heights. They are also running lines of fortifications close to the Spanish blockhouses at many points, from which they keep up a well-directed fire. The Spaniards are not a match for them in sharpshooting, for many of the reserves have never shot off a gun until they were brought into action on the Riff Coast.—The Roghi, or Pretender, who a few months ago seemed to be a formidable antagonist of the Sultan of Morocco, has been captured by the Sultan's troops at Marakesh, the southern capital. Many of his followers were tortured or decapitated, and the victorious troops returned to Fez with heads on their pikes and swords.—It has been expected that the Spanish Government would put off the convocation of the Cortes as long as possible, in order to prevent the Opposition

from having an opportunity of attacking its actions in Melilla and Barcelona, but it has decided instead to call the Cortes in October. The disorders of Barcelona have had an effect of rallying the country generally to the support of the Government even in an unpopular war. It appears that the rumors of the atrocities committed by the mob during the time when they were in possession of the city were greatly exaggerated. The reports of murder, torture and outrages of peaceful citizens, priests and nuns were without foundation. The mutilated limbs which were carried thru the streets on pikes by the mob were from bodies disinterred from the convent tombs. The burning and spoliation of convents and churches were carried out in a systematic manner by organized bands of rioters, mostly boys, but there were few manifestations of international cruelty or blood lust. The military organ, *Ejercito Español*, is not without justification in criticising the respectable classes in Catalonia for their supineness in this crisis in the following language:

"Where were they when these savage rioters were going about streets, burning convents, disinterring bodies to drag them round the town, turning children into streets to die of hunger? They, so they say, are the strength, wealth, influence, and power of Catalonia, and they shut themselves in their houses like timid women at the sound of the first shots, bewailing, no doubt, like women, what they could not defend like men, and hoping that the central power, which they despise, would send the army, which they hate, to rescue them from their sorry plight."

Aviation at Rheims

The first international flying contest in the history of the world opened at Rheims

on Sunday, August 22. Cash prizes amounting to \$80,000 are offered and trophies of very great value. Considering how recent has been the development of flying machines heavier than air, the number of contestants is remarkable. Altogether, forty-four machines have been entered for the contest. France has thirteen contestants, a larger number than any other country, and since, for the international cup, only three representatives of each country are permitted under the rules, preliminary trials will be held for the selection of the foremost competitors. The first day of the tour-

namment was windy and rainy, and it was not until nearly evening that the machines could be started. The best records in these preliminary trials were made by the Wright biplanes, first, second and third places being taken by Paul Tissandier, Comte de Lambert and M. Lefebvre, using Wright machines. Lefebvre, who adopted the profession of aviation only less than two months ago, made the best time around the course. M. Bleriot, who crossed the Channel, and M. Hubert Latham, who has made two unsuccessful attempts at the same feat, made flights on the first day in their monoplanes, but the Wright biplanes showed greater steadiness in the gusty air. Glenn Curtiss, being the only American representative, did not take part in this preliminary contest. The international trophy, the Gordon Bennett Cup, and a cash prize of \$5,000 will be awarded on August 28 to the contestant who makes the best time around the 10 kilometer course. Immense numbers of spectators have come to Rheims, and all available rooms in the city were engaged weeks in advance.—The Wright brothers have brought suit against the Aeronautic Society of New York for infringement of patent on the ground that the machine bought by the society from Glenn H. Curtis, contains the improvements which they have invented.—Walter Wellman made a second attempt to reach the North Pole by airship from Spitzbergen, but again failed. The dirigible balloon "America," carrying Mr. Wellman and a crew of three, made a good start in the morning with a favorable wind, but after it had gone about 32 miles a leather guide-rope broke, dropping a thousand pounds of provisions and stores. The balloon, released from this weight, rose at once a mile above the sea and was lost in the clouds. The aeronauts decided to return to the starting point and tacked back against the wind until the steamer "Fram" was reached, which undertook to tow them back to port. In this process, however, the balloon was caught by gusts of wind and torn loose from the tow rope, and being driven by the wind back over the ice, it exploded. The airship was recovered and will be repaired for another attempt.

Confusion of Property with Privilege: the Dartmouth College Case

BY JESSE F. ORTON, A.M., LL.B.

[Last week Mr. Orton discussed the Dartmouth College decision from the historical standpoint. In this issue he follows with a criticism of the decision from the legal standpoint. These articles succeed in logical sequence President Hadley's admirable article in our issue of April 16, 1908, entitled "The Constitutional Position of Property in America," and will be followed from time to time by others on the Fourteenth Amendment and the attitude of the bench and bar toward personal and property rights. The whole series is intended to present a somewhat complete picture of the present status of democracy in the United States. For a further discussion of Mr. Orton's two articles see our editorial pages in this issue.—EDITOR.]

THE doctrine that corporate charters and franchises are contracts and not subject to repeal has been in some measure evaded in many of the States by reservation of the power of repeal or amendment. Yet the statement of Mr. Cotton is still true, that the doctrine of the sacredness of charters and franchises, growing out of the Dartmouth College case decision, "has woven itself into the tissue of our law, as has, perhaps, no other paper-made doctrine of constitutional law."

One of Marshall's eulogists has said that the effect of this decision was "to withdraw the obligations of contracts from the power of the State Legislatures to impair their validity, and to place them also beneath the protecting egis of the Constitution." In truth, it did nothing of the sort. The protection of ordinary contracts from impairment by the States was effectively secured by the words of the Constitution. What Marshall and his associates did was by a forced and unheard-of construction to include, under the term "contracts," certain acts of legislation which ought to be at all times open to repeal or amendment. The decision has been briefly explained in the previous article. The royal charter given to Dartmouth College in 1769, providing that the college should always be governed by a self-perpetuating board of twelve trustees, was declared to be forever binding on the State of New Hampshire. Under the clause in the Federal Constitution forbidding any State to pass laws "impairing the obligation of contracts," it was held that the Legislature could not

increase the number of trustees to twenty-one and provide temporarily for the appointment of new trustees by the governor and council.

The chief question in the case was thought to be, whether this institution was public or private. The highest court of New Hampshire had pronounced it public. Chief Justice Marshall admitted that the purpose of the institution was public, that "education is an object of national concern" and that "there may be an institution founded by government, and placed entirely under its immediate control, the officers of which would be public officers, amenable exclusively to government." His decision was based on the conclusion that this institution was founded by private parties with private funds and that the incorporation did not change its character except to make it "immortal" and its management more convenient. He took no account of the principle, declared by one of his successors in 1876, that certain institutions or enterprises, conducted exclusively with private funds but having a purpose "affected with a public interest," are proper subjects for State regulation and control.

Among the mistakes of law and fact contained in the reasoning of the court, there are two very serious ones which relate to the particular facts of this case. First, Dartmouth College was in fact public in its foundation and endowment as well as in its purpose; and, second, the college charter contained no such contract as the court assumed to find and enforce.

(1) Unfortunately, counsel for the State were congenitally and did not get

all important facts into the record sent to Washington. But many additional facts were brought to the attention of the Supreme Court in connection with the three additional cases begun in the United States Circuit Court and certain motions made before the Supreme Court in the college case proper. Mr. Shirley concludes that Marshall knew the essential facts. This author shows that the large sums of money collected in Great Britain and America by Eleazer Wheelock, which Marshall says were paid to the corporation "on the faith" of the "contract" between "the donors, the trustees and the crown," were never contributed or paid to Dartmouth College at all, but to Moor's Indian Charity School. This school, founded by Wheelock and already endowed by Josiah Moor, altho carried on by Wheelock on the same grounds as those occupied by the college, was kept entirely separate from Dartmouth College in management and financial support. It appears almost certain that the first endowment of the college was the gift of public land presented on behalf of New Hampshire by John Wentworth, Colonial Governor, soon after he issued the charter. Other public donations by the State followed, as well as certain private donations. The massive structure of conclusions based by the court on the alleged "private foundation" falls to the ground.

"The Earl of Dartmouth and the other trustees in England," whom Marshall names as probably "the largest contributors," on April 25, 1771, wrote to Dr. Wheelock:

"We shall expect that you keep a regular and distinct account of all moneys laid out in erecting the school, educating Indian youths and equipping and maintaining missionaries agreeable to the design of our institution, and that you do not blend them with your college, and other matters foreign to and separate from our undertaking."

On November 9, 1770, Dr. Wheelock had written to one of these English trustees:

"The charter was never designed to convey the least power or control of any funds collected in Europe, nor does it convey any jurisdiction over the school to the trustees of the college. . . . If I resign my office as president of the college, I yet retain the same relation to the school and control of it as ever."

It is supposed that the college was named after the Earl of Dartmouth, instead of after Governor Wentworth, its real benefactor, in order to mollify the displeasure felt by the noble Earl and his co-trustees at Wheelock's failure to stick to the original plan and confine his attention to the Indian Charity School, a purely missionary enterprise.

(2) The Chief Justice said: "It can require no argument to prove that the circumstances of this case constitute a contract." The contract which Marshall enforced against the State of New Hampshire was a supposed agreement, by the English King, that the charter should not be repealed or amended in essential particulars by any future legislative act. But the late Chief Justice Charles Doe, delivering the opinion of the New Hampshire Supreme Court in 1886 in the case of Dow vs. Railroad Company, has shown that if George III had attempted to make the contract which Marshall enforced, he would probably have lost his crown and the agreement would have been plainly illegal and void under the English Bill of Rights of 1689 and the Act of Settlement of 1701. James II had been deposed in 1688 for making contracts of this sort, that is, for assuming to suspend or nullify the legislative authority of Parliament. While the college charter contains suitable language to indicate that the grant, so far as the King was concerned, was to be permanent rather than for a term of years and would not be revoked or changed by him, it contains no word suggesting that the King or his agent, Governor Wentworth, had any intention of promising exemption from legislative authority and control. The English Parliament has always had, and on occasion has exercised, the power to repeal and amend corporate charters.

Even tho the Supreme Court erred in treating Dartmouth College as a "private school," and in enforcing a so-called contract which no one ever dreamed of making, the question of chief importance remains: If a corporation is "private" in the sense in which Marshall used the term, and if a State Legislature has unequivocally attempted to make its charter and privileges irrevocable, is such an

act a contract protected by the Federal Constitution from change by any future Legislature?

The prohibition against "laws impairing the obligation of contracts" had its origin in the provision of the "ordinance of 1787" for the government of the Northwest Territory, to the effect that no law should be made interfering with or affecting "private contracts or engagements" previously formed. The proceedings of the Constitutional Convention indicate that the purpose of modifying this language was to restrict rather than to enlarge its scope.

Very important evidence as to the intended meaning of this provision is found in a report made to the Maryland Legislature by Luther Martin, a distinguished member of the convention from that State. He said he had opposed this "contract" clause of the Constitution because he thought the States should have the power, in times of public calamity or distress, to pass laws "totally or partially stopping the courts of justice, or authorizing the debtor to pay by instalments, or by delivering up his property to his creditors, at a reasonable and honest valuation." These were the practices, therefore common in the States, which the clause was designed to prohibit. If Luther Martin had known of any claim that its scope was wider than private contracts and that it would forbid the repeal or alteration of numerous legislative acts, it is not conceivable that he would have neglected to state the fact to his State Legislature. It is no more conceivable that such an intended invasion of the rights of the States could have crept into the Constitution without the strongest opposition.

That the term "contracts" was designed to include only agreements between private parties, is most probable. If any agreements by States were held to be contracts in the constitutional sense, none could reasonably be so included except agreements made by the State in its private capacity, as when, for example, it should borrow money, employ workmen or contract for the erection of a public building. Acts of legislation, done in the public capacity of the State, were excluded by reason, sound policy and the general understanding of men.

If the power of individuals to organize themselves into a corporation is not to be considered a special privilege conferred by the State, but is a common right regulated by general laws, no legislative act relating to incorporation can be considered a "contract." It is only with reference to special powers, not possessed by all citizens in common, that the "contract" claim is made. But if we conclude that the mere right to exist as a corporation is a franchise or special privilege, and if we admit that sovereign States have authority to grant special privileges to individuals, such a grant must of necessity be only temporary.

That a special privilege, once granted, cannot be withdrawn, is a contradiction of the original powers of sovereignty and is abhorrent to the intellectual perceptions as well as to moral principle. If a State is to grant privileges to some, it must have the power to do so by withdrawing privileges from others. The result of any "contract," therefore, which makes a special privilege irrevocable is to subtract a portion of sovereignty from the State and confer it upon individuals. But sovereignty, in its very nature, is continuous and indestructible. If a part of it may be lost, the whole may be lost by successive losses of different parts, a result absurd and unthinkable. This principle is well stated by Chief Justice Doe: "The agents' authority to make law does not enable them to suspend their own duty, and bind their principals, by agreeing with a third party that law shall not be made." The prohibition in the Federal Constitution against "impairing the obligation of contracts" was never intended, could not in logic or reason have been intended, to prevent a State from preserving its own integrity, from retaining the power to legislate as fully and completely next year as it can legislate this year, from withdrawing any special privilege which it has granted.

If the mere right to be a corporation is a special privilege which a present Legislature cannot guarantee against repeal or change by a future Legislature, much more is this true of those immensely valuable privileges, so often granted in corporate charters or elsewhere, by which the most important powers of sovereignty are claimed to have been "contracted."

away to private parties. These powers vary from the most trifling up to some of the very highest and most essential, among which are the power of maintaining the existence of the Government by taxation and the power of protecting citizens from the extortions of monopoly.

The chief precedents for the decision in the Dartmouth College case were two cases in which Marshall had delivered the opinion of the court. In one of them, *Fletcher vs. Peck* (1810), the court extended the "contract" clause of the Federal Constitution to prevent an act of alleged confiscation by the Legislature of Virginia. There are few lawyers who will not admit that this was a judicial amendment of the Constitution by means of a clever legal fiction. This case is generally regarded as having been collusive, a mere sham battle in which both parties desired to obtain the same decision. The evidences of collusion were so plain, upon the face of the record, that they were remarked by Justice Johnson in his opinion. In *New Jersey vs. Wilson* (1812) Marshall had held that the State of New Jersey had contracted away forever the right to tax certain private lands and that this "contract" was protected by the United States Constitution. This case also is open to grave suspicion of collusion, and practically no lawyer now defends the decision on any ground.

The principle assumed to have been established in the Dartmouth College case has been refuted and repudiated many times by the Federal Supreme Court. The case still has the force of law within a narrowed scope, and it is often referred to in terms of great politeness. But when the court musters up the courage to overrule it, few arguments will be needed in addition to its own opinions. Certain of the State Supreme Courts, notably that of Ohio, long and persistently stood out against a recognition of the doctrine of this case.

Before Marshall's death in 1835 he and Story were sharply overruled by a majority of the court in *Ogden vs. Saunders*, in which it was decided that the prohibition against laws impairing the obligation of contracts does not apply to contracts made subsequent to the enactment of the law in question. Mr. Cot-

ton, referring to Marshall's dissenting opinion in this case, says "it is hard to see that it is anything more than ingenious and fantastic."

In the *Charles River Bridge* case (1837) the court, under the leadership of Chief Justice Taney, decided that tho legislative "contracts" may be protected by the Constitution, such alleged contracts must be construed according to a rule directly opposite to the rule applicable to private contracts; in other words, grants of privileges by the State are to be construed strongly in favor of the granting party, while private grants are construed strongly in favor of the grantee. This doctrine, that nothing can be taken from the State unless it is expressly granted, led the court to hold that no exclusive franchise had been granted to the bridge company. Justice Story dissented earnestly, and logically, if the doctrine of the college case was sound.

In *West River Bridge Company vs. Dix* (1848) it was settled that a State may, by the power of eminent domain, take back any property or privileges which it has bargained away in a corporate charter or otherwise, making compensation for the value of what it takes. This doctrine is directly inconsistent with the college case decision, as Justice McLean forcibly pointed out in his opinion in the *Charles River Bridge* case. A violation of contract does not become less a violation by reason of the fact that the protesting privilege-holder is given money on being deprived of what he contracted for.

In the "Granger cases" (1876) it was decided that tho a railway corporation is authorized by its charter to make "reasonable charges," the State may by law say what charges are reasonable; and that when property, corporate or otherwise, is devoted to a use which affects "the community at large," such as transportation or storing grain, the conduct of the enterprise and the charges to be paid by the public are matters for legislative regulation. The sacredness of corporate charters was quietly ignored. By reiecting the logic of the Dartmouth College decision, Chief Justice Waite made it possible to control public utility monopolies, such as transportation, telegraphs, telephones, electric and gas lighting, etc.,

in case where the charter does not definitely fix the rates that may be charged.

In repeated decisions the Supreme Court has held that the "police power" of the State is held in trust by the Legislature and cannot be contracted away, even by the most solemn and formal agreement ever put in a corporate charter. The police power "extends to the protection of the lives, health and property of the citizens, and to the preservation of good order and the public morals." Under this doctrine, the Legislature may prohibit lotteries, the manufacture and sale of liquor, the carrying on of noxious trades in populous centers, etc., in spite of charters which expressly authorize the doing of the things prohibited. Yet Justice Strong spoke truly when, in his dissenting opinion in the case of the Northwestern Fertilizing Company, he said: "The police power of the State is no more sacred than its taxing power." He might safely have said "than any other legislative power." The majority of the court overruled the Dartmouth College case in principle, tho not in name.

Marshall's doctrine that the taxing power can be bartered away by special contracts of private parties with the Legislature, has not escaped violent assault in the Supreme Court, tho its undoing has been thus far delayed by the fact that it rests on a definite precedent which cannot be dodged, but must be followed or overruled. In *State Bank of Ohio vs. Knoop* (1853) Justice Catron, dissenting, said: "The sovereign political power is not the subject of contract so as to be vested in an irrepealable charter of incorporation, and taken away from, and placed beyond the reach of, future Legislatures."

The taxing power is a political power of the highest class, and each succeeding Legislature having vested in it, unimpaired, all the political powers previous Legislatures had, is authorized to impose taxes on all property in the State that its Constitution does not exempt." In *Washington University vs. Rouse* (1869) Chief Justice Chase and Justices Miller and Field, dissenting, said, thru Justice Miller, that to hold that a Legislature "can, by contract, deprive the State forever of the power of taxation, is to hold that they can destroy the Government which they are appointed to

serve." In the words of Justice Miller, the doctrine of irrepealable tax exemptions "must finally be abandoned," but no more certainly than the entire doctrine of irrepealable special privileges to individuals or corporations must be abandoned.

In the *Chicago Lake Front* case (1892) it appeared that in 1869 the Legislature granted to the Illinois Central Railroad Company a tract of more than one thousand acres under Lake Michigan, the principal part of Chicago's harbor, extending a mile into the lake. The grant having been repealed in 1873, this suit was brought to see if the repealing law was void, as "impairing the obligation" of the original grant. It was decided, four against three, that the repealing law was valid on the ground that the Legislature held the title to submerged land under navigable waters in trust for the people and could not alienate it except in such small parcels, or in such reasonable and limited ways, as might serve the public purposes of navigation, commerce, etc. Justice Field, giving the opinion of the court, said: "The power to resume the trust whenever the State judges best, is, we think, incontrovertible. The position advanced by the railroad company * * * would place every harbor in the country at the mercy of a majority of the Legislature of the State." True as this is, it is no less true that the Legislature holds in trust for the people other public property and privileges, and that the Dartmouth College decision, in utter disregard of this principle, has placed, for example, the streets of every city at the mercy of a majority of the State Legislature or of the municipal body to which legislative power has been delegated.

By acts passed in 1856 and 1865, the Minnesota Legislature incorporated a railroad which later became the Great Northern, and gave it almost unlimited authority to consolidate with other railroads: but it was provided that the charter could be amended "in any manner not destroying or impairing vested rights." In 1874 a law was passed prohibiting the consolidation of parallel and competing railroads. In 1895 the Federal Circuit Court in Minnesota was called on to decide whether the act of 1874 impaired

the contract contained in the charter, the Great Northern having attempted, after 1874, a consolidation with the Northern Pacific. It was claimed that the right to consolidate did not become "vested" until it was exercised, and therefore the act did not "destroy or impair" any "vested right." The circuit judge held that "there is no distinction, in reason or in the authorities, between the right to a franchise that has been and the right to one that has not been used," unless there has been a forfeiture for non-user; and that "the franchise to consolidate with another railroad corporation was a vested right of this defendant from the time of the acceptance of its grant."

The circuit judge was right—if there is any virtue in the Dartmouth College decision. But the Supreme Court of the United States, only two dissenting, decided that he was wrong, that the right to consolidate did not become "vested" until used. That they did not do the logical thing and overrule the college case decision is to be regretted; but that they refused to apply it, even tho using a distinction that does not distinguish, is cause for satisfaction and hope. Justice Brown, giving the opinion of the court, said: "We think it was competent for the Legislature, out of due regard for the public welfare, to declare that its charter should not be used for the purpose of stifling competition and building up monopolies. In short, we cannot recognize a vested right to do a manifest wrong." These are brave and just words. When courageously and consistently applied to the whole field of

constitutional law, they will destroy the last vestige of the doctrine resting on the Dartmouth College decision and will restore to the people of the States that complete and continuous control of legislation which the Constitution gave them.

In his dissenting opinion in the Charles River Bridge case, Justice Story expressed the opinion that an exclusive franchise to build and maintain a bridge across a river between two cities, did not constitute "a monopoly." His definition of monopoly was, "An exclusive right granted to a few, of something which was before of common right," such as, for example, an exclusive right to navigate a river. Because special legislative authority was necessary for individuals who would build a bridge, an exclusive franchise to build one would not deprive any citizen of an already existing right. By the same test, an exclusive franchise to run a street railway or lay gas pipes or string electric wires, would not establish a monopoly. From judges so utterly incapable of economic reasoning or of taking a long look ahead, we should not expect very good law on economic subjects. We should not judge them too harshly, for they were trained and lived in a different age. But that we should allow their mistakes of fact, their legal misconceptions, their economic obtuseness, their partisan passions and prejudices, to reach down thru the decades and make law for us in regard to some of our most vital interests—this is hard to explain on the theory that we are an intelligent, self-governing people.

Forbidden Paradise

BY KETA B. PARKER

THE barrier falls,
And in between our rushing hearts
No guard is set, and yet
'Tis only when I dream of thee
That thou art mine.

For when I wake,
There high as heaven a flaming sword
In angel hand doth stand
To bar our path by stern decree,
Mandate divine.

BY E. P. POWELL

NOTE: THE "ORCHARD AND FRUIT GARDEN," ETC.

HAS it ever occurred to you to consider how much land in the United States is given to streets, and how very little value we get from most of it? If so, go farther and estimate how much might be got from our highways, without making them in the least less useful for driving and hauling. They cost us large sums for repair—which, by the way, is a misnomer, for you cannot mend what has never yet been made. If properly made, the street might become at once a source of income in all ordinary cases, sufficient to cover the expense of construction; and in time this could become a handsome fee to cover general taxation. We have given away the use of our streets, as if valueless. There is no reason why franchises to private corporations should not be let or sold on a coöperative plan. American life has too much of this wastefulness. Our churches and even our schools are a dead cost to us, quite unnecessarily, as I will try to show hereafter. But confining our attention to highways, we find millions of acres, generally of fertile land, only a narrow strip needed for driveways, and the rest turned over to wild nature. We thus eliminate from cultivation and generally give over to weeds a huge slice of our common heritage. This use of territory, or rather its misuse, is often a menace to adjacent farm property, from the breeding of weed seeds. The most rigid laws fail to protect us in this regard, except in thickly settled neighborhoods. It is a fact that many of our new pests spread themselves around the country by following up the roadways. In this way, and by railroads, the dandelion traveled hundreds of miles thru the wilds of Michigan.

Bear in mind that until the stock laws, that were enacted for the most part along between 1860 and 1875, our highways were a vast pasturage, and for a pioneering and primitive society served a public need. This was altered suddenly; to the

advantage of the owners of cattle no doubt, for it led to a new method of foddering immensely more economic and convenient. The country boy could also be put to better use than hunting his cows every night over a long-strung pasturage of miles. We learned that such feeding and such methods were enormously wasteful and that we could keep the family cow in much better condition on the intensive plan from a single acre. The milk flow was doubled by the soiling method, that is, feeding cut food. The ten-acre farm from that day grew to be more valuable than the hundred-acre, for one acre of sowed corn gave us as much food as thirty acres of pasturage. Then came the silo and irrigation, and intensive farming won the day.

But the street, what of that? Simply nothing. We saved building one hundred and fifty million dollars worth of fences in New York State, one hundred millions in Illinois, ninety millions in Missouri, and so it was everywhere that we had the stock laws; and that at first was all that came of it. Our streets were left as so much land let go to the wild, and that is true of our streets to the present day. The grass grows freely, and generally the weeds grow with it. Curiously even this grass is seldom utilized, and there are thousands of acres of aftermath every October left uncut in the townships where hay is most needed. Occasionally a farmer's cow is staked out to eat the roadside grass in patches, and foul the drives. On the whole the streets have simply been relegated to the charge of nature.

The uses to which our streets could be put are numerous, and in the first place the tree planting might be made more judicious, and important to the people. Shade is by no means all that we can secure. Planted wisely, trees might be thinned, giving an immense amount of posts and firewood. In fact, the streets might be supplementary to a decent forestry system. If in charge of a com-

mission, as they should be, the trees might be so planted as to serve as windbreaks, greatly modifying the climate. This is gradually getting to be better understood by our farmers. A good windbreak not only heads off damaging winds, but prevents the rapid drying of our fields and gardens. A

diagonally, and allowing sufficient space for development, the avenue would soon present the appearance of a grove. This sort of planting requires wide streets; wider than most of our country roads are at present laid out—probably wider than is advisable.

The character of the trees planted in

E. P. POWELL.

clean sweep for dry air, driven across your land for half a day, is frequently more than a counterbalance for a fine shower. It drinks up the moisture and sweeps it off to be reabsorbed in clouds. If our streets are properly planted with stout trees, making barricades, without breaches, the wind force is so lessened as to be very helpful to the bordering fields and orchards. If double rows of trees are used it must be with caution, for if planted too closely, the interlacing limbs in time create an accumulation of dead and brittle branches; however, double rows are especially useful as windbreaks, while serving better for shade. Planted

our streets should also be considered from an economic standpoint. The maple, which is so commonly used, needs the care of a very skilful horticulturist, but the linden is a big-hearted affair, with huge leaves, and a habit of healing up its own wounds. Now let your imagination play a little to consider what would be the result of planting several millions of lindens for bee food. Our streets would immediately become honey-producing, to a degree almost beyond conception. There is not one other tree to rival it. When in blossom the honey-makers swarm to it, and will work all night if there be moonlight. It would pay any

township to plant these basswoods, purely to add to the wealth of their bee yards. Among other bee trees one of the best is the gleditschia, sometimes called honey locust. It blossoms just before the linden, and its flowers are not so showy, but bees take to it and almost cover it during the season of expanded flowers. There is a thornless sort, which should of course be selected for tree planting, the thorny variety being positively dangerous both to cattle and men.

I do not, however, see why the sugar maple may not also become a source of income if largely planted in our streets. Its decay will not be hastened seriously by tapping it for sugar, and from fifty trees one may easily lay in his full supply of sugar for the year. The real danger to the sugar maple as a street tree comes from planting too close together and later sawing off large limbs. The bark will not endure the hot sunshine, opens cracks, and there the insects begin their boring and eating. It is a naturally healthy tree if not mutilated with the saw. Careless tapping would of course injure the tree, but done conservatively the trees would last one hundred and fifty years. This would add enormously to the saccharine products of the United States. For two centuries the bulk of sugar used by our people was home-made from the maple "bush."

Then we have a fine group of nut trees which might add to the productive power of the streets. Purely for shade there are few trees to equal the chestnut, walnut, and hickory. The market for nuts is constantly increasing and likely to continue to absorb everything that can be grown. The trees named are long-lived and enduring; with irregular contour, but coming under the general lines of round-headed trees. I like the chestnut peculiarly because, with all its greatness, it does not require rich soil. It thrives over rocks, where its roots have to find crevices for themselves. In France it is said to begin to grow where corn stops. But what a tree it is in its completest development; taking one hundred years to reach its fullness, and lasting three hundred more—always beautiful, granting splendid shade, and a great nut-bearer almost from the start! The finest in America are now found in the Caro-

linas, but Connecticut mountains were once clothed with them. Some of the New England trees are eighty feet high and nine in diameter—their shade is perfect.

The butternut is rather open in its growth, but its yield of delicious nuts is wonderfully generous. Like the black walnut it is not cordial to some other forms of vegetation. But grass will grow under it, so that, while not a very good lawn tree or field tree, where you wish to cultivate corn or potatoes, it is a good street tree. The black walnut is magnificent in growth, and like the butternut it is not always a good neighbor, but I know of no reason why it should not be used freely in our streets. However, the hickory is so much better in its nut product that I would choose it by all odds. Always beautiful, and more so with age, its nuts are the delight of old and young. The limbs are tough and the shade is perfect. Better yet is the fact that it sheds its foliage like the butternut early in the fall and puts it out late in the spring. This is sometimes reckoned a defect, but it is a very positive advantage, for along our sidewalks and driveways we need shade only in the hot months—the rest of the time the more sunshine the better.

The pecan is a subform of the walnut, and in the Southern States is sometimes found by the roadside. There are thousands of miles of highway, from the Ohio to the Gulf, that might be made enormously profitable by using the pecan as a street tree. Not only is the nut always salable, but it is growing in importance. I do not think of this phase of economy without at the same time visioning the joy that would be added to childhood.

I consider furnishing bird food another desirable aim in street tree planting. The wild cherries are very ornamental, very tough wooded, giving good shade, and they are clean trees. I always keep a few of them growing along my fence lines, not only for the beauty of the blossoms, but because birds of passage drop down all thru the autumn months to take a dinner on their way southward. I think these trees are the main reliance of the robins during their migration. The mulberry furnishes as-

tonishing quantities of a rich berry that everything likes from fowls to human folk. In the Southern States there are varieties with fruit two inches long and half an inch in diameter. It is a splendid tree for shade and I cannot understand why the fruit so seldom gets into market. Perhaps the mulberry would be debarred from street planting from its superabundance of fruit that stains whatever it touches. Better would be our native persimmon, not only in the Southern States but as far north as Central New York. At least, I have a tree that was planted forty years ago and it has never failed to give me a crop. The tree is handsome in growth, altho the wood is somewhat brittle. In the Southern States, at least the lower South, it would be preferable to graft in the Japanese sorts.

Planting fruit trees in the street must of course be undertaken with discretion. There are varieties of apples that droop too much in their growth, and there are varieties of pears that are erect as a Lombardy poplar. The Baldwin apple is well adapted to street use, provided the trees are set at a good distance apart and are properly trimmed at the outset. The fruit is hard and tasteless until some time after being picked in October. On the contrary the McIntosh and Hubbardston and Northern Spy might run some risks in the presence of boys. But the Swaar and Rhode Island Greening and Wagener and Black Ben would defy the craving of passing tramps. A row of such trees could be grown in the street as readily as in the orchard, with a probable loss of very little fruit. If you are more generously inclined, and would make the pedestrian happy, set a row of Gravenstein and Fameuse. These apples, ripening earlier and dropping freely, would be appreciated. As a rule, however, those sorts should be selected which ripen only in midwinter, which have tough wood and stout up-reaching branches. The Spitzenberg would sprawl its limbs over the pedestrian and become a nuisance. However, I do not see why we may not have apple avenues, cherry avenues, and pear avenues near our towns.

I was driving along a quite rural highway recently and found that the farmers for more than half a mile had adopted the habit of plowing and planting down

to the ditch side. Potatoes and corn were growing almost in reach of the horse. The land was fertile and the crop was promising finely. I asked one farmer, who was hoeing, if any one objected. "Not at all," he said. "Why should they? We keep out weeds, and we keep the ditches in good condition, as well as all manure off the roadbed. We rake it up and use it on our potatoes. You cannot find a prettier road anywhere about, except it be right near town, where they have money and men to work it. Out here if we didn't cultivate it, it would be a bumbly bit of weeds and wet holes, and the ditches would be just furrows plowed out once a year, and the road wouldn't be near as dry and good." The man was right; the manure went to the crops, and there would be several hundred bushels of tubers and a large amount of corn to add to the food product of the people. That this sort of culture could be carried on everywhere is not to be argued, but it can be in the remote districts, and it ought to be under the direction of road commissioners. Our highway commissioners, as at present appointed, are hardly prepared to take charge of the whole road problem. There can, however, as a rule, be found two or three men in a township to whom this whole subject of tree planting and general care of the roadway could be safely left. Selected by the people, entirely out of party lines, they might be left in permanent control.

Nearer towns it is not rare to find lawns that are planted, by individual enterprise, down or out to the ditches that border the drives. This might be a universal custom in well settled districts. If done judiciously it makes an unbroken landscape of cleanliness and beauty. There are few places where there can be any objection to this sort of planting, and none anywhere if the roadway be thoroly made to begin with. Flowers and shrubs in the street, with occasionally an erect growing evergreen, do not disturb the purpose or the use of the street. The dirty plan of plowing the roadsides and scraping the soil into a ridge to drive on, would of course be interrupted; only that is no longer considered, or it ought no longer to be considered, road-making.

The terms good roads and road improvement need enlargement. They should mean not only better driveways and motor ways, but streets economically and esthetically constructed. At present our highways constitute altogether a vast stretch of desert, with here and there an oasis. They should constitute a continuous garden, into which our homes and farms fit and are unified. From this vast national garden should come a proportionate revenue for the people. Franchises to use our streets should be coöperative; yielding a tax-abolishing revenue. There are scores of towns that ought now to be without an annual tax list; it should be paid on a sound business principle by the rental of public property. It is a blundering system that allows a few temporary officials permanently to dispose of our public wealth. Possibly in turn, a franchise that does not pay the corporators should be shared in its losses by the public. The market question is of course most important, but our American households should invariably include features that give delight to the young, and enter into education. Fruit and nut trees have an intellectual stimulus and a good deal of moral salvation; so also do beautiful lawns and well constructed highways. I would line the streets with such things as lift up the eyes of the boys and girls, and bring them into keen and constant association with the squirrels and the birds—even if it involve a measure of rivalry in the chestnut trees.

The dust problem is the one that still remains to be considered; and that this is an economic part of the question we shall all agree. Sprinkling with carts is costly and continuous, and is conceivable only on short stretches, near by or in villages. During the present summer I have driven thru and in clouds of dust that could not be seen out of for many miles. The lawns and fields and gardens on either side, for many rods, were gray with road deposit. The damage to crops was less than to health, but both were serious. Pleasure driving was impossible; autos were steadily in a cloud, and were not a little accountable for its density. There was no let-up of any sort except where oil had been applied to the road surface by a country golf club. In-

quiring, I found the cost of this application to be gaged by the width of the drive, and that a single application to an ordinary road of fifteen to eighteen feet in breadth would be from fifty dollars per mile to one hundred and fifty. I am, however, not concerned with road-making in the ordinary sense of the word, but only with the economy of dust suppression in order to ennoble the whole highway.

The use of streets in conjunction with our streams is a topic by itself. Wasted water-power could be brought to the highway very often to establish electric plants for doing a great deal of farm labor, besides lighting houses and barns. The Country Life Commission, in its final report, lays large emphasis on the farmer's right to use water-courses. These should not be sold, nor should they be granted to corporations without a full partnership of the people. It is equally uneconomical to drain all of these into the highway to be dashed, without rendering any service to the people, into the larger streams in the valleys. Every brook will some day be wanted, and it will be looked upon to be as important property as the soil itself. I do not doubt but that the highway will ultimately be notable for its electric plants; from which power will be distributed coöperatively thruout the neighborhoods. Drinking fountains should be established at least for every mile of highways, and if possible at four corners. Bird boxes should be plentiful for the bluebirds, wrens, robins, and other insect eaters. Our bird alliance must go a great deal farther than it yet has gone, purely from an economic standpoint.

Now sum up your proposition and you find in the single State of New York seventy-four thousand miles of highway, with about six acres to the mile. This gives in the neighborhood of four hundred and forty-four thousand acres of roadway. The rest of the States can only be estimated, some having more, but most of them less acreage than New York. To multiply by thirty will, however, not put us much astray; giving for the whole United States fifteen millions of acres of roadway at a very low estimate. Twenty-five thousand miles makes the belt about the globe; so we have in

the highways of New York State alone three world girdles, and for the whole United States one hundred such equatorial lengths of strung-out acres. One-third only of this vast property is needed for travel and haulage, and we have to leave all the rest of it for future reclamation by the people.

Let us at least begin to look upon our streets as property, and not as a no-man's-land, a waste place for refuse, a mere convenience when we travel or haul. Adopt your roads, beautify them, culti-

vate them and make them pay. Do this individually until it can be done collectively. Road economics is a subject that cannot be much longer put off. Our enormously growing population will need that every foot of soil be made to do its best. We certainly cannot spare over fifteen millions of acres from all participation in American production. I am not stating this problem too strongly; for there is more money in our roads than in our mines, and to get at it will not be as difficult a task.

CLINTON, N. Y.

Why the Shah Abdicated

BY OUR PERSIAN CORRESPONDENT

ABOUT once every century, and sometimes oftener, Persia has awakened from her apathy, caught up in a way with the procession of nations, and then, wrapping her robes about her, has gone again to sleep. While it is only at these waking cycles that the busy world remembers that the land of Cyrus and Darius is a political entity, yet I doubt if there is a country so small, so sparsely populated as Iran, that has had a more marked influence upon the world's history. Even China can hardly claim to be older, and no country so well known has at the same time been so isolated.

We are just now passing thru one of these waking periods in Persia, and if we were to count time by events, the last three years would be longer than the century that preceded them. History has been made so fast that neither England nor Russia has been able quite to keep up with it. Every day brings some surprise, some unexpected change, even to these two Powers which are the only ones now in a position to forecast the future.

Three years ago we had a government that was an absolute monarchy and, with the exception of a small circle about the Court of the worst sort, the people had no voice in affairs. Within three years Muzaffar-ed-Din, remarkable alone for

his reckless prodigality, has died, and his son, Mohamet Ali, after less than two and a half years, has been forced to abdicate.

There have been periods in the history of the Persian Court when it had a touch of romance and grandeur about it, but that distinction can hardly be claimed for it now. True, some of the trophies of the great warrior, Nadir Shah, gathered in India, still remain in the palace to remind us of days when Persia had a place among nations of which she was not ashamed; but these trophies now remain only because the grafters that have made up the Court since the death of Nasr-ed-Din, in 1896, have been unable to pawn or sell them.

The last three years will be known in Persian history as the reign of terror. The struggle has been between the old and the new Persia, the so-called Royalists and the Nationalists, and the result has been that in nearly every province there has prevailed semi-anarchy. For quite a year Tabriz was besieged by the Royalists, the place holding out under the nomadic warrior, Satar Khan. It was only quite recently that the Russians stopped the fight by sending their troops there. Little by little the revolution spread until the Shah's authority extended but little outside the walls of Teheran. He had been able to hold the capital only

by the aid of the cossack brigade since the *coup d'état* of June 22, 1908. The commander of this brigade, Colonel Liakhoff, a Russian, was the real governor of the city. It was pretty well recognized on both sides that as long as the capital remained in the hands of Mohamet Ali, he still held the key to the situation. Since the bombardment of the National Assembly, at the date above mentioned, the city had remained quiet. Indeed it was too quiet, for much of the time business was suspended, money became very scarce and the poorer classes were without work. To dissipate the gloom, the grafters at Court, chief among them being Amir Baharadur Jang, Minister of War, gave brilliant and expensive dinners to the diplomatic corps and high Persians. One only has to hear some of these governmental representatives talk to understand that not a little dust was thrown in their eyes by these wily Orientals. Many of them only

THE SAPADAR.

Next Minister of War, leader of Nationalist forces that took Teheran and deposed Mohamet Ali Shah.

laughed when the possibility of the revolutionists entering Teheran was mentioned. The London *Times*, reflecting this view in its issue of July 9, just four days before the city was taken, said:

"Our special correspondent in Teheran thinks it hardly credible that, in view of the intimation of the dispatch of Russian troops, the advance of the Bakhtiari will be persisted in. The courage of the revolutionaries has considerably cooled, and many of them recognize that their game is up."

Even the Shah had been led to think by those about him up to the very last that he would be saved, "tho as by fire," when the Russian troops arrived from Baku. But before these troops could ar-

THE GREAT NATIONALIST PREACHER AND ORATOR, HADJI MUTAKALIMIN.

Strangled by the Shah's orders, June 23, 1908.

rive the revolutionists had made their attack and had won the day.

Certain unnecessary cruelties had been inflicted upon the Nationalists at the first battle when the Assembly was broken up that the people had sworn to avenge. Chief among them was the strangling of Hadji Mutakalimin, the noted orator and Mohammedan preacher. Another case even more distressing had been that of

the editor of the Assembly newspaper, who was likewise strangled by order of Mohamet Ali, then Shah. Men like Slamon Khan were kept chained in filthy places until their bodies were full of sores and abscesses. In this special case Slamon Khan was thus confined from June until late in December. Others with larger purses bought their freedom

MIRZA JAHANQIR KIHAW,

Editor of *Sur-i-Israfil*, strangled June 23, 1908, by order of Mohamet Ali Shah. The *Sur-i-Israfil* was the leading political journal of Teheran

at an earlier period. A score of the best men fled to Europe, while others joined the revolutionists in the provinces to await the day when they should have an opportunity to avenge the wrongs that had been inflicted upon them because of their political views. But back of it all was even a deeper feeling that the constitution must be restored by its friends and not by its enemies.

The sending of Russian troops to Tabriz seems to have hastened matters, for out of the anarchy and chaotic conditions that had appeared all over the country arose two armies. The one from the south had been organized from the Bakhtiari hill tribes, while the one from the north was under the command of the

SATAR KHAN.

The nomadic Turk who defended Tabriz for a year against the Shah's forces.

Sapadar, a man with a wonderfully clear head. He had come to Teheran as a young man, without a penny, from the despised province of Mazenderan, and within a few years accumulated a vast fortune. He has been a member of the Shah's cabinet at different times, as well as holding other responsible positions. As these two armies approached Teheran, those who knew the situation appreciated their strength. The commander of the Bakhtiari troops was met at Kum, one hundred miles south of here, by the English and Russian Consuls, and told that their coming to Teheran "would not be pleasing to the Powers." The only answer this brought from him was a more rapid advance of his troops. The Bakhtiari horsemen are famous in Persia, and they are noted as fighters. This time it was not to be a slaughter of unarmed, defenseless men shut up in the Assembly building. The Cossacks fought bravely, but they had men worthy of their steel.

The 4th of July was ushered in at Teheran by the roar of cannon and the clash of muskets. The Cossacks were

being driven from their position at the Karaj River, sixteen miles west of the city, where the two armies had united. After nine days' skirmishing, covering a distance of fifteen miles on either side of the Enzeli-Teheran post-road, the Cossacks were driven back to their barracks in the town. On the thirteenth day of July the Nationalists, under the command of the Sapadar, attacked the city, the wall and gates of which were defended by the Shah's troops.

It was quite seven o'clock in the morning when the attacking army reached the city gate. They were all mounted, dust-covered, and had every indication of having spent the night in the saddle. The guard at the gate was swept away, before they realized what had happened, while the invaders pushed steadily forward. When they were well within the wall they separated, showing that they were well organized. Certain divisions of the army had been given special quarters of the city to attack. The larger part, however, pushed on to the Assembly Hall, from which the Nationalists had been driven in June, 1908. There was much shooting, as I can testify, for I happened to be caught in the street; the bullets seemed to be falling like hail. The city was soon in the hands of the Nationalists, except the Cossack barracks and the Dochin-Tapeh gate. At the barracks were a thousand Cossacks, while the Shah's army outside the city was supposed to number five thousand. The invading army was smaller, the exact number not being stated. Firing continued for seventy-two hours, the Nationalists with rifles behind walls, while the Shah's forces bombarded the town from the neighboring hills and the Castle-Kajar. The Cossacks freely used their heavy guns from their barracks in the center of the city. The city being built of mud and sun-dried brick, the heavy guns could do little damage. When a building was struck the ball simply tore out a hole in the wall, otherwise no harm being done. The sharpshooters from behind the walls did the greatest damage to life. No one will ever know how many were injured and killed, but the number cannot be over five hundred; some make it more but others think it less. After every other place in town was captured the Cossacks

under Colonel Liakhoff, surrendered. There were no cruelties inflicted, such as were witnessed a year before when the Royalists were successful. Very little looting was done, and in nearly every case the stolen goods have been found and returned. A very serious attempt has been made by the Nationalists to command the respect of the better element in the community. This is, of course, essential to success.

The surrender of the barracks took place late in the evening of the 16th, and early next morning Mohamet Ali sought refuge at the Russian Legation, at their summer home in Zergendy, which is about six miles from the town in the hills. The Nationalists commanding the situation immediately demanded his abdication, altho a few days before they had confined their demands to the dismissal of the crowd about him, the organization of a new Cabinet and the withdrawal of Russian troops from Persia. With the abdication of Mohamet Ali, there at once arose the question of the succession, which was speedily settled by the choosing of his thirteen-year-old son, Ahmet Ali, the Crown Prince. The Azad-ed-Dowleh, head of the Royal Kadjjar family, was chosen "governor" of the new Shah. He may later be given the title of regent, but unquestionably the National Assembly and local "anjumans" propose to hold the reins of government. A new ministry is being organized with the Sapadar as commander of the army as well as Minister of War. The Cossacks had hardly surrendered until Colonel Liakhoff, their commander, was offered a place on the staff, and the Sapadar chose as his personal escort a company of the same Cossacks he had just been fighting. It is hardly probable, however, that Colonel Liakhoff will remain in Persia.

That the Nationalists have scored a great victory; that they have surprised nearly everybody by their toleration and self-control, cannot be denied. Whether or not they can meet the heavy demands that will be put upon them remains to be seen. While the horizon is darkened by many cross-winds it is yet the best chance the Nationalists have ever had. The cruelties and oppression of the old régime are still fresh in the minds of all;

the semi-anarchy that swept the country during the last year and a half, paralyzing all branches of trade, has taught its lessons. All interests will welcome a season of tranquillity. The question many are asking is whether or not the leaders can unite on a common policy. The future alone can reveal this, but it is very hard for those who know Persia, to reconcile Mohammedanism with the more liberal forms of government. There have been for centuries in Persia two sets of laws, the sacred law based on the Koran, and the common law, administered by the authorities. The sacred law is in the hands of the priests and high-priests, and is held in much higher esteem by the people than the edicts of any parliament. We may well ask if toleration has advanced in the Mohammedan world until they are ready to incorporate in their government the magic words, "Liberty, Equality and Fraternity." Unless this be the case it is hard to see how the ship of state can be kept off the shoals. Then there is the

question of Russia's troops now in West Persia, Kasvin and other points along the Enzeli-Teheran post road. When Persia demands their withdrawal Russia can say, Pay us what you owe us! This, of course, will be impossible, and the troops may remain. As I have already hinted, the treasury is empty; trade is at its lowest ebb, thus reducing the customs receipts to an amount insufficient for the ordinary running expenses of the Government, which must include the interest on the national debt. In many places the peasants are refusing to pay the usual taxes, with the result that the landlords are in a bad way.

As I write tonight Teheran is ablaze with fireworks in honor of the new order of affairs. The late Shah, Mohamet Ali, a prisoner at the Russian Legation, awaits a safe escort out of the country. His thirteen-year-old son yesterday was placed on the throne, but there was no crown. Was it too large and heavy for the young shoulders, or is it in pawn?

TEHERAN, PERSIA.

"When Love Is Great"

(An Amendment)

BY ELAINE GOODALE EASTMAN

WHEN Love is great, it doth not cry
 "Off with the yoke—I must be free!"
 But claims the larger liberty
 In bonds of Truth to live and die!

When Love is great, it owns no flaw—
 The Church's blessing purely craves—
 And builds its house above the waves
 Upon the age-old rock of Law.

When Love is great, then Passion fades;
 Then, constant as yon fadeless sky,
 Sweet Honor lights us from on high,
 And heavenly Duty gilds the shades.

Not that weak soul, poor toy of fate,
 But he whose oath was ne'er forgot—
 The master of his heart and lot—
 He only knows when Love is great!

AMHERST, MASS.

Cuba, Hayti and the Dominican Republic

BY JOHN BARRETT

[This ends our series of articles by the Director of the Bureau of the American Republics on "Opportunities in Latin America." This series has embraced all the Republics in South and Central America and the three in the following article. The previous articles have appeared in our issues of December 3, 1908; January 14, March 11, April 15 and July 29, 1909 --EDITOR.]

THE earliest settlements by the European discoverers in America were made on the islands of Cuba and Hispaniola. Today these islands are three independent republics, the former retaining its ancient name of Cuba, but the latter has changed into Hayti and the Dominican Republic.

Cuba has been during the last ten years very much within the public eye, yet it may be questioned whether sufficient attention has been given to the remarkable progress in many material directions since the beginning of the century. The area of the republic, 45,883 square miles, makes it somewhat smaller than Pennsylvania, but nature has blessed the country with a varied climate and an extraordinarily rich soil, of which true advantage has not yet been taken. There is no doubt, however, but that the erroneous notion of the inaccessibility of the interior of the island must be overcome at once. Cuba was the second country in America to operate a steam road, being in this respect eleven years in advance of Spain. The date of this first road was 1837. Since then the mileage has increased to about 2,500 miles, so that, compared for instance with Tennessee, which has somewhat similar geographic conditions and is almost the same size, Cuba is by no means lacking in interior communication. Connecting Cuba with foreign countries are twelve lines of regular steamers, while her ports are visited by cargo steamers and sailing vessels from Europe and America. Many good roads have recently been constructed thruout the island, and, as one tourist has just declared, it is a paradise for the automobile or for the equestrian who wishes the pleasure of riding over the country, where he sees the old and new so intimately blended.

These few striking conditions illustrate the decided progress in modern Cuba. The ante-bellum hostility to change and improvement has almost disappeared. No more positive demonstration can be brought forward than the interesting fact that \$150,000,000 of American money has recently been invested in Cuba. Co-related to this are the development of the public school system; the steady growth of immigration which, beginning in 1903, increased over 400 per cent. in 1906, and would have continued thus had not the American intervention changed, for the time being, the policy of the Government. Of this immigration the United States supplied the largest number after Spain. This is significant of Cuba's entrance into industrial life and of the forces at work to vitalize her inexhaustible resources.

It would be tempting to discuss other phases of Cuba's progress, but emphasis must be given to the opportunities there for certain classes of investors. Cuba is so open today that the capitalist should not need to be told of the chances lying before him. Where the railroad leads the way, others will follow, yet the manufacturer must pay more attention to the purchasing power of the Cuban people. The traveling salesman must make himself and his American goods more a factor in their commercial life, and by personal solicitation give proof of the excellence of his wares. Besides these classes, however, there is a growing body of Americans who wish to escape the severity of northern winters, while they still remain close to the civilization they know and love best. There is abundance of land in Cuba suitable for small or large farms; the soil and climate are well adapted to all citrus fruits and garden products, which find a market along the Atlantic seaboard. There is splendid op-

portunity to make a home in Cuba, because, long before the century is half over, this beautiful island, so near the United States in every way, is bound to be a great factor in supplying the necessities demanded in increasing quantities thruout the world.

Hispaniola was the name once used for the island in which are now the two nations—members of this International Bureau—the Dominican Republic and Hayti. The former, on the east, has an

wide peninsula, is the magnificent Bay of Samaná, one of the most expanded and protected harbors in the West Indies. Northwest lies the fine old town of Santiago, which is already connected by railway with the coast, and toward which the Government is ambitiously pushing a railway from the capital. Within this section is the well-populated area of the country, where the 610,000 inhabitants are chiefly settled. From here come the principal resources, which

THE NEW PLAZA HOTEL, HAVANA, CUBA.

area of 18,045 square miles, about twice the size of New Hampshire; the latter, on the west, measures 10,200 square miles, somewhat larger than Massachusetts. In many respects these two countries are only beginning, as the century opens, to develop their marvelous natural resources.

A line drawn due south from Boston, 1,400 miles, will pass thru Santo Domingo, the capital of the republic. Northeast from here, across a

are and for a long time must depend upon pastoral and agricultural industries, altho there is some warrantable promise of manufacturing for local demand. Sugar, cacao, tobacco, coffee, mahogany and hard woods are the sources of income, but gold, copper, coal and petroleum are produced in commercial quantities. West of the better known section, however, is a stretch of wonderfully rich and healthful country, abounding in tropical and sub-tropical

forests, well-watered uplands and mountain slopes, into which man has made little headway. Much of the land is virgin and belongs to the Government, which invites into it immigration freely and generously. When once this interior of the Dominican Republic is penetrated by the railroad—and nobody can doubt but that before the middle of the century the island will be thus traversed in several directions—it will rival Cuba and Jamaica both in productive capacity and in potentiality for home building.

A line drawn directly south from New York, 1,400 miles, will pass thru Port au Prince, the capital. The population of the republic is given as 1,400,000, making 137 to the square mile, being, next to Salvador, the most thickly settled country in all America. Yet it would seem that Hayti is less known or visited than any nation in the world. Its history, which has many incidents inspiring to the patriot, is ignored; its civilization and productive capabilities are unrecognized, and the wonderful interior of this portion of the island are as much a matter of hearsay as that of Alaska at the time of its purchase from Russia. Nevertheless, the mountain areas, lying only a few miles beyond the coast, can boast of astonishing natural wealth; the soil is fertile as that of any country in the West Indies; the virgin forests are as rich in hardwoods or pine as Cuba; while every report made by the traveler who honestly penetrates above the narrow fringe of tropical low land emphatically declares that the climate is undeniably suited for the health and well-being of the white man. Hayti has always been celebrated for its cacao and coffee; mahogany has for years been exported to the extent of millions of pounds. Yet the trade in these staples, as well as the exchange payment for them in manufactured products which the numerous population must have, has been carried on so persistently by Europe, that the United States has lost almost uninterruptedly since 1805, and slight effort is made to re-establish it.

Opportunities in Latin America.

Particular countries need particular details in presenting the opportunities in each, but broad statements will cover

them all, and the American people must recognize that this century will decide forever the future of the western hemisphere, and that the growing force in Latin America makes it imperative for us to take advantage of the vast possibilities there.

Two factors which would seemingly thwart our desire for intimacy with these twenty republics to the south of us must be considered. One is climate; the other is accessibility.

The northern portion of Mexico, the southern portion of Brazil, all of Uruguay, almost all of Argentina, Chile and Paraguay, lie within the temperate zone, and are as healthful as any region of the United States south of the Ohio. The remainder of the country lies within the tropics. But only as far as geographical location is concerned. Omitting a narrow fringe of coast on the Atlantic and Pacific, the basins of the Amazon, the Orinoco and Paraguay rivers, in which the altitude is only a few hundred feet above sea level, all of Latin America is so elevated that the climate is remarkably well suited to the health and vigorous expansion of the dominant races of Europe. Elevation, not latitude, decides climate. Consequently Mexico, Central America, Colombia, Ecuador, Venezuela, Peru, Bolivia and Brazil can boast of as stimulating conditions in considerable areas as the world offers. Moreover, the epoch-making accomplishments on the Panama Canal demonstrate that the climate of "low latitudes" is robbed of its terrors. Science has shown that the causes of so-called tropical diseases can be eradicated. Therefore the tropics will some day become well-inhabited areas of productive activity.

Remoteness has hitherto been an objection to all proposals toward fostering more intimate acquaintance with Latin America. But as the remoteness of California has disappeared before the influence of the railway, so has the remoteness of the southern continent vanished before the modern ocean greyhound. Chile was once separated from the United States by a weary sail of months; today the port of Valparaiso is only twenty-five days from New York. Buenos Aires, reckoned by the rate of travel to Liver-

pool, would be scarcely twelve days from the Atlantic seaboard, altho present facilities require twice that time. No port of South America will

and Germany have learned it, the greater proof shall we give of our international perspicacity.

Labor, in all Latin America, is per-

THE PASSENGERS' WHARF AT PORTO PLATA, DOMINICAN REPUBLIC.

be more than a four weeks' trip from New Orleans when the Panama Canal and the railroads now actually under construction are completed. Distances which our ancestors regarded as impossible this generation estimates as a mere pleasure jaunt, and will take with as great equanimity as that with which the Bostonian goes to the Berkshire Hills. Latin America is literally, therefore, at our very doors.

Two other factors are seemingly little understood by those not well acquainted with Latin America. One is the temperament of politics often falsely called "revolution"; the other is the condition under which labor is performed.

Omitting any discussion of the ethics or psychology of a Latin American revolution, it can be asserted that the disturbance to business or commerce is usually no more than what results in the United States during a Presidential election, or in such a labor crisis as the recent strike on a railway in Georgia. The sooner we learn this, as England

formed by the descendant of the native Indian or by the comparatively unadvanced immigrant from South Europe. Together they constitute a peasantry distinct in manner and education from the aristocracy. This lower class bears the burdens. The North European or the Yankee can no more live at the primitive standard accepted by them than he can in the black belt of Mississippi, and every hope held out to him to the contrary leads to disaster and misery.

All this clears the way for the statement of opportunity for the individual, the colonist and the investor.

The individual belongs to one of two classes—the wage-earner or the investor. As a seeker for a job he will be disappointed in Latin America. Unskilled labor is poorly paid, and it is far better for the wage-earner to stay in his own home, or wander within his own country, than to go where he is almost sure to fail. Success has been achieved against all odds, in Latin America as well as in the United States, but this is

an exception, far less frequent there than here. If, however, the wage-earner is sent by a responsible company to carry on special work in Latin America, his fortune ought to be made. Opportunity begins for him right there. The field is immense, the demand for improvements that call for technical skill almost inexhaustible, and the reward, in the long run, exceedingly encouraging.

The individual who, on the other hand, is a student seeking for material, has a whole world of romantic investigation before him. What better examples can he set for himself than Humboldt and Darwin? Latin America has yet innumerable questions waiting for solution. The rivers of the interior must be navigated, the mountain fastnesses explored, climatic conditions tabulated, ethnic influences analyzed. Besides these, there are engineering

men. Every Government invites instructors from abroad to introduce the methods which have made Anglo-Saxon schools so productive. These are opportunities which must not be overlooked or let slip. In another direction a splendid field lies ready. Such work as the Y. M. C. A. is doing in Mexico, Rio de Janeiro and Buenos Aires can be duplicated in other capitals. No activity can promise greater reward than that following the promotion of a robust Christianity. Further away from the centers of civilization the call for spiritual uplift becomes even more impressive, and the opportunity in that regard even more remarkable. As a single instance, take Hayti, with its crowded areas, far off as yet from modern life, altho one of our nearest neighbors.

"How can land be obtained in Latin America?" is a question very frequently

THE CENTRAL MARKET PORT-AU-PRINCE, HAYTI.

problems which, when settled, will lead to immense results in the industrial world. The field of education is also open to the ambition of trained young

asked of the International Bureau of the American Republics. With an area of 9,000,000 square miles in the twenty independent republics, and a population

of 70,000,000, it is evident that millions of habitable acres yet remain untouched. Moreover, the Governments welcome earnest settlers and are liberal in disposing of land to those seeking the opportunity for settlement. Nevertheless, immigration takes a character different from that which has built up the United States. The colonist system prevails there, and what is in the United States called the homestead system is not generally understood.

The individual immigrant can find work, he is assisted by the Government, and he can acquire land; but if he comes from the United States he will find himself in alien surroundings, and may meet failure. On the other hand, the colony can take root at once, and the acquisition of land by this means should be encouraged. The steps to be taken are technical, however, and demand foresight and the expenditure of money. With slight modifications from one country to another, a colony is established by negotiation directly with the Government. Land is thus allotted, certain privileges granted, certain obligations assumed, and this colony, as a social unit, is permitted to work out its own destiny. If the (North) American can adapt himself to this spirit, he can thus partake of some of the richest land in the world. Land can be purchased, also, in every republic. Land companies work in Argentina, Mexico, Panama, Paraguay or Cuba, exactly as in the United States. Besides this, every Government sells virgin, unsurveyed land, at a price ranging from one dollar an acre upward. But the settler must have it surveyed at his own expense, and must agree to cultivate it. If therefore a colony is organized properly, there is no reason why it should not meet thoro success in making homes for its members in many areas of Latin America. If also the purchaser of land exercises the same care and judgment in studying surroundings that would be expected of him in the United States, his opportunity is equally substantial. The individual, nevertheless, whether wage-worker or settler, is warned that the chances are against him if he has to compete with the native, whose standard of living is far below what prevails in the United States.

The manufacturer and investor are, however, the class to whom opportunity is greatest and to whom it should appeal strongest. Latin America bought and sold, in 1907, \$2,077,000,000 worth of goods. Of what was sold, \$318,000,000 came to the United States, but of what was bought, only \$240,000,000 came from here. The balance was supplied by Europe. It is a tale never too frequently retold until the lesson is learned. When the merchants of the United States understand how vast a market lies before them, and how to sell to their neighbors, the first step will have been taken.

Manufacturers must study these markets as carefully as they study home markets. The astonishment expressed by all keen-witted travelers at the purchasing power of these peoples and the regret that American manufacturers have not appreciated the highly developed character of the consuming public, is a never-ending phrase in letters coming to the International Bureau of the American Republics. It is gratifying to note, also, that a change is taking place. Personal investigation is substituted for the unproductive method of catalogs. Direct acquaintance is recognized as better than lifeless correspondence. This is the essential factor in all business as well as in friendship. When, therefore, the manufacturers of the United States can, from actual experience, rate at their true worth the tremendous forces at work in the industrial life of Latin America, they will then comprehend how illimitable is this commercial opportunity.

The bonds of the Argentine Republic were recently offered to the investing world. Before the opening day for their sale arrived, these bonds were taken up twenty times over, in London, Hamburg, Paris and New York. These bonds are an index of the industrial progress of the nation. In other republics, too, the Government fosters the ambition to develop the immense productive potentialities of the country. Mexico, Brazil, Chile, Uruguay, Cuba, Costa Rica and Peru are similarly advancing in modern industrial life. Can any one doubt, when reading of the railway extension, of the growth of cities, of the

increase of farm areas, of expanding productiveness and commerce in every direction, that Latin America will play a splendid rôle in the world's history? Destiny points to Latin America as one of the vital factors in the twentieth century. Yet there are more railways to be built, harbors to be improved, water powers to be harnessed, cities to be modernized, mines to be opened, forests to be cut, and land to be cultivated. It must not be said that United States capital has no part in these wonderful undertakings. We must do even more, reap even more than our share in this

progress, for we are all republics together, and we are setting an example of nationalism in the New World. We must buy from them and sell to them; with our capital, our brains and our sympathy, help build their railroads, clear their forests, plow their fields, enlarge their harbors and place good American vessels in them.

With this end in view, I venture a prophecy which seems hardly possible of miscarriage, that as the century lengthens proof will become more positive that Latin America is the Land of Opportunity.

WASHINGTON, D. C.

The Novels of Alfred Ollivant

BY WILLIAM LYON PHELPS, Ph.D.

LAMPSON PROFESSOR OF ENGLISH LITERATURE AT YALE UNIVERSITY.

IN the year 1898 there appeared in America a novel with the attractive title, "Bob, son of Battle." In a few months everybody was talking about it; and unlike most of the "best sellers," it has not vanished with the snows of yesteryear. At this moment it is being read and reread all over the United States. I do not believe there is a single large town in our country where the story is unknown, or where a reference to it fails to bring to the faces of intelligent people that glow of reminiscent delight aroused by the memory of happy hours passed in the world of imagination. It seemed from the very first so immensely superior to the ordinary run of new novels that we gazed with pardonable curiosity at the unfamiliar signature on the title page. Who was this writer, who knew so much of the nature of dogs and men? Where had he found that extraordinarily vivid style, and what experiences had he passed thru that gave him his subtle insight into character? But all that we could discover was that Alfred Ollivant was an Englishman and that "Bob" was his first novel. We decided that he must have lived long, observed all kinds of dogs, and a large va-

riety of men, women, and children; and that for some reasons best known to himself, he had chosen to print nothing until he had descended into the vale of years. For, only the other day we were not surprised to find that "Joseph Vance" was the first fruit of a man nearly seventy; the book was evidently the expression of a man who had had life, and had it abundantly.

Our astonishment was keen indeed when we learned that the author of "Bob" was a youth of twenty-four, who had hurt his spine in athletic sports, and who had written his wonderful book in horizontal pain and weakness. An injury in football, followed by a fall from a horse, abruptly checked his chosen military career and made him a man of letters. Literature owes a great deal to painful accidents and enforced idleness, whether it be in bed or in jail. The wind bloweth where it listeth; and we perceived once more that genius does not always accompany good health, or maturity, or ambition; it seems to select with absolute caprice the individuals thru whom it speaks. And so this first born child of the brain was delivered, like human infants, on a bed of suffering, being,

to complete the analogy, none the less healthy on that account. We proceeded to await with interest the verdict of English criticism; for the scenes were laid in Britain, it dealt with manners and customs peculiarly English, and it was aimed at English readers. Eleven years have passed, and we are still vainly listening. The curious fact is that "Bob"—so warm a favorite in America—is practically unknown in England. The professional London critics have never heard of him, and the average reader has not even a hearsay acquaintance. If ever there was a fine illustration of the prophet without honor, we have it here.

To a slight degree this strange neglect may be explained by unusual circumstances of publication. The novel was offered to a London firm, and accepted; it was christened "Owd Bob." A copy of the manuscript was then sent to America; the New York publishers wisely changed its name, and printed the book, with what success is needless to state. Meanwhile for some reason the aforesaid London firm delayed publication a whole year. The author employed these months in completely rewriting the story, and so the first English edition, unfortunately entitled "Owd Bob," was a thoroly revised version of the American. Thus a novel, written by an Englishman, was, by purely fortuitous circumstances, first circulated in America; while the English edition, altho the same story in outline, is quite different in detail. Nor can any one, who has read both, hesitate an instant as to which is superior; the British version is clearly better, the ratio of excellence being, as so often happens, in-

versely as the circulation. One has only to compare the manner in which "Red Wull" made his début in America with the chapter where he first appears (in a totally different way) in the English edition, to see how evidently second thoughts were best. It is perhaps possible that a good book may be killed by a poor name; but we cannot believe that enormous popularity in America and utter obscurity in England can be accounted for by the change in the mere wording from "Owd Bob" to "Bob, Son of Battle." No, bearing in mind the futility of literary prophecy, I still believe that the day will come when "Owd Bob" will be recognized as belonging to English literature.

The splendid fidelity and devotion

of the dog to his master have certainly been in part repaid by men of letters in all stages of the world's history. A valuable essay might be written on the dog's contributions to literature; in the poetry of the East, hundreds of years before Christ, the poor Indian insisted that his four-footed friend should accompany him into eternity. We know that this bit of Oriental pathos impressed Pope:

"But thinks, admitted to that equal sky,
His faithful dog shall bear him company."

One of the most profoundly affecting incidents in the "Odyssey" is the recognition of the ragged Ulysses by the noble old dog, who dies of joy. During the last half century, since the publication of Dr. John Brown's "Rab and His Friends" (1858), the dog has approached an apotheosis. Among innumerable sketches and stories with canine heroes may be mentioned Bret Harte's brilliant

portrait of Boonder; Maeterlinck's essay on dogs; Richard Harding Davis's "The Bar Sinister"; Stevenson's whimsical comments on "The Character of Dogs," and Jack London's initial success, "The Call of the Wild." But all these latter-day pamphlets, good as they are, fail to reach the excellence of "Bob, Son of Battle." It is the best dog story ever written, and it inspires regret that dogs cannot read.

No one who knows Mr. Ollivant's tale can forget the Gray Dog of Kemuir—the perfect, gentle knight—or the thrilling excitement of his successful struggles for the cup. He is indeed a noble and beautiful character, with the Christian combination of serpent and dove. But Owd Bob partially shares the fate of all beings who approach moral perfection. He reminds us at times of Tennyson's Arthur in the "Idylls of the King," tho he fortunately delivers no lectures. Lancelot was wicked, and Arthur was good; but Lancelot had the touch of earth that makes him interesting, and Arthur had more than a touch of boredom. In "Paradise Lost" the spotless Raphael does not compare in charm with the picturesque Foe of God and Man. The real hero in Milton, as I suspect the poet knew, was the Devil; and if Mr. Ollivant had ignored both English and American godfathers, and called his novel "The Tailless Tyke," no reader would have objected. Red Wull is the Satan of this canine epic; he has for us a fascination at once horrible and irresistible. The author seems to have felt that the Gray Dog was overshadowed; and he has saved our active sympathy for him by the clever device of making him at one time dangerously ill, when we realize how much we love him; and finally by throwing him under awful suspicion, that we may experience the enormous relief of beholding him guiltless. But, in spite of all moral instincts, Red Wull is the real protagonist. Dog and master have never been matched in a more sinister manner than Adam McAdam and the Tailless Tyke. Bill Sikes and his companions are nothing to it, and we cannot help remembering that to the eternal disgrace of dogs, Bill Sikes's last friend forsook him. Compared with Red Wull, the Hound of the Baskervilles

is a pet lapdog. When Adam and Wullie appear upon the scene, we look alive, even as their godly enemies were forced to do, for we know something is bound to happen. When the little man is greeted with a concert of hoots and jeers, we cannot repress some sympathy for him, just as we feel for the would-be murderer Shylock, silent under the noisy taunts of the feather-headed Gratiano. This bitter and lonely wretch is a real character, and his strange personality is presented with extraordinary skill. There is not a single false touch from first to last; and the little man with the big dog abides in our memory. Red Wull is the hero of a hundred fights; his tremendous and terrible exploits are the very essence of piratical romance. After he has slain the two huge beasts of the showman, McAdam exclaims with a sob of paternal pride, "Ye play so rough, Wullie!"

And the death of the Tailless Tyke is positively Homeric. The other dogs, all his ruthless enemies, whisper to each other and silently steal from the room. They know that the hour has struck, and that this will be the last fight. The whole pack set upon him, each one goaded by the remembrance of some murdered relative or by some humiliating scar. Red Wull asks nothing better than meeting them all; and the unequal combat becomes a frightful carnage. At the very end, as much exhausted by the labor of killing as by his own wounds, the great dog—now red indeed—hears his master's familiar cry, "Wullie, to me!" and with a supercanine effort he raises his dying form from the bottom of the writhing mass, shakes off his surviving foes, and staggers to McAdam's feet. Like Samson, the dead which he slew at his death were more than they which he slew in his life.

Mr. Ollivant's next book, "Danny," also a dog story, was not nearly so effective. The human characters command the most attention, tho the old man with the weeping eye is sadly overdone. The passages of pure nature description are often exquisitely written, and prove that at heart the author is a poet. But in the narrative portions there is an unfortunate attempt to conceal the slightness of the story by preciousness and affectation in the style. For the simple truth is, that

in "Danny" there is no story worth the telling. We remember distinctly the lovely young wife and her grim iron-clad of a husband, but just what happened between the covers of the book escapes us. No one, however, has been so severe on "Danny" as its maker; for he was so dissatisfied with his work that he suppress it, a fate that, with all its faults, it did not really deserve. Such an act, however, is an indication of the high artistic standard that Mr. Ollivant has set for himself; ambitious as he is, he would rather merit fame than have it.

While the readers of "Bob" and "Danny" were guessing what kind of a dog the young author would select for his next novel, he surprised us all by writing an uncanonical work. This story, adorned with happy illustrations, and printed in big type, as tho for the eyes of children, was called "Red-Coat Captain," and was enigmatically located in "That Country." Mr. Ollivant felt that the book would appeal at first only to a very few, and he requested the publisher not only to refrain from issuing any advertisement, but to make the entire first edition to consist of exactly three copies, one for the archives of the House, one for the author, and one for a believing friend. The children of this world are wiser in their generation than the children of light; and the shrewd man of business did not take the petition very seriously. It should be remembered, however, that one publisher had already declined the manuscript, saying emphatically that it was nonsense; and if there had not been a strain of idealism in the head of the firm that accepted it, the book would probably never have left the press. The verdict nonsense has been loudly ratified by many reviewers and readers; to the few it has been wisdom, to the many foolishness. For, as was said years ago of a certain poem, "The

capacity to understand such a work must be spiritual." It matters not how clever one may be, how well read, how sensitive to artistic beauties and defects, qualities of a totally different nature must be present, and even then the time and the place must be right, if one is to seize the inner meaning of "Red-Coat Captain." I was about to say the inner meaning of a story like "Red-Coat Captain," but I was stopped by the thought that no story like it has ever been published, and perhaps never will be. Both conception and expression are profoundly original; and in spite of some failure of articulation, the

work is strongly marked with genius. It is an allegory based on the eleventh and twelfth commandments, which we have good authority for believing are worth all the ten put together. From one point of view it is a book for children; the mysterious setting of the tale is sure to appeal to certain imaginative boys and girls. But the early chapters, dealing with the pretty courtship and the honeymoon, will be fully appreciated only by those who have some years to their credit or otherwise. There is in this story ineffable charm and fragrance of purity; it is the lily in its author's garden.

Adam M'Adam.
The hero of "Bob, Son of Battle."

Mr. Ollivant's latest novel is the most conventional of the four, and wholly unlike any of its predecessors. It is a rattling riotous romance, placed in the troublous times of the Napoleonic wars. The mighty shadow of Nelson falls darkly across the narrative, but the author has not committed the sin—so common in historical romances—of making a historical character the chief of the *dramatis personae*. The title role is played by "The Gentleman," and he is a hero worthy of Cooper or of Stevenson. Marked by reckless audacity, brilliant in swordplay and in horsemanship, clever in turn of speech, gifted with the manner of a pre-Revolution Duke—what more in the

heroic line can a reader desire? The architecture of the novel and the staccato paragraphs remind one of Victor Hugo, whom the author seems to have read with profit. Nor, outside of the works of Stevenson, have we ever seen a story minus love so steadily interesting. It is an amphibious book, and those who like fighting on land and sea may have their fill. The percentage of mortality is high; soldiers and sailors die numerously, and the hideous details of death are not forgotten; there is a welter of gore. If this were all that could be said, if the undoubted fascination of this romance depended wholly on the crowded action, it would be simply one more exciting tale added to the hundreds published every year; good to read on train and turbine, but not worth serious attention or criticism. But the incidents, while frequent and thrilling, are not, at least to the discriminating reader, the main thing, as the Germans say. Nor the construction, clever as it is; nor the characters, real as they are; the main thing is the style, which, quite different from his former books, is yet all his own. The style is, in the best sense of the word, pictorial;

it transforms the past into the present. The succession of events rolls off like a glowing panorama. It is perhaps natural that many reviewers should have praised "The Gentleman" more highly than all the rest of Mr. Ollivant's work put together; and it is not surprising that in England, where Nelson and Napoleon are names to conjure with, "The Gentleman" has found many readers. But, notwithstanding its wider appeal, it lacks the permanent qualities in "Bob," and (I believe) in "Red-Coat Captain," for they are original.

That Mr. Ollivant is now on the road to physical health will be good news, at least in America. He has already done work that no one else can do, and we cannot spare him. His four novels indicate versatility as well as much greater gifts; and his future publication should be watched by all who take an interest in contemporary literature and who believe that the future is as rich as the past. "Bob, Son of Battle," looks like the best English novel that has appeared between "Tess" in 1891 and "Joseph Vance" in 1906. Nothing but bodily weakness can prevent its author from going far.

SEVEN GABLES, HURON CITY, MICH.

After the Passing Bell

BY LEWIS WORTHINGTON SMITH

News item: "Meredith left an informal prohibition of the publication of his correspondence, . . . but the same ethics that in many other cases has been deemed to absolve the living from the wishes of the dead . . . may very naturally be found to prevail here."

WHILE the music throbs the requiem
And the hosts are marching by,
In the chambers of the palace
Where his private treasures lie,
They are gathering, friend and servant,
Maid and guardsman of the gate,
Taking each the thing he fancies,
While the dead king lies in state.

Here a pen that signed great papers,
There the portrait of a friend,
Here the riding-whip he carried,
There a coin he would not spend.
Things his heart held sweet and sacred,
When the glad years grew elate,
They are sorting out for auction,
While the dead king lies in state.

Lackeys who have scraped his table
Of the crumbs that soiled the cloth,
Under-lords to whom his splendor
Was the candle to the moth,
Pull the curtains from the windows,
Share the pictures and the plate,
Counting earth so much the gainer,
While the dead king lies in state.

He who gave himself so freely,
Made all life more nobly rich,
Still has bounty for the beggars
Mired and muddled in the ditch.
Out of noisome courts and alleys
Where keen-eyed the vultures wait,
They are thronging to the banquet,
While the dead king lies in state.

DES MOINES, IA.

Embarrassment of Years

BY LAURA WOLCOTT

BUT why should you make calls?" the Nice Young Person said. "At your time of life why not let your friends come to you instead?"

What is my time of life? The phrase is superfluous. "Impertinent?" you ask. Oh, not from my friendliest Nice Young Person! But really——

At my time of life? I can go up many flights of stairs—with landings. I climb hills also, with the added pleasure of pausing to view the landscape, which younger people miss.

I remember dates, and people's names, and current events; and the past is no more charming to me than the present, except that it was in itself more charming.

I can weed flower-beds, even like Celia Thaxter of vivid memory, at Appledore. I love all human kind from soft babyhood for play to hard age withering and waiting to be consoled.

My time of life! I can thread needles. Points may come first, in the exasperating way of modern needles, but in time——

I can read into the small hours of the morning and then lie down to cheerful dreams or dreamless sleep like a babe on its mother's breast.

I can thrill to bird songs from the exultant wood-thrush's freedom song to the lonesome whippoorwill's complaint.

I love the meanest flower—yes, weed—that blows. It does not suggest thoughts too deep for tears. All my thoughts are of the exquisite bliss of living. If sunshine have its charm, so has the rain. Was it not Elizabeth Stuart Phelps who deplored the old hymn sung on pitiless July Sundays?—

"No midnight shade, no clouded sun,
But sacred, high eternal noon."

I go out into my dewy garden and watch every seed that sends up from the mystery below two tiny leaves like to the far-away spread of bird wings against the blue; just two crooked lives full of expectation.

"Fine salads some day," says the Nice

Young Person, peering for the tiny growth and trying to look sympathetic.

Some day? Perhaps. But my life is in the Now. What are green-white curly leaves under Lucca oil and lemon juice with talkative folk about the table but ministers to a lower sense? The spirituality of the salad lies in its Antæan touch—its slow sucking out of disreputable earth that which lifts its head to the skies.

From my south window I watch a wabbly robin tilting on a Norway spruce limb against the high wind; shifting its clinging feet, half spreading foolish, untried wings that know no joy of the air, only terror of the earth. Under the dull, ruffled feathers a timid heart, pea-size, quakes up and down as the branch flies; a wide bill opens to let out "yes, ma'am, yes ma'am," trailing off in quick "s ma'ams" as the high wind wrestles with the tree—as if remembering its promise to sit still till mother came, forced to break the letter, but keeping the spirit, and sustained by a quivering hope.

Gladly would I fetch the looked-for worm, except that courtesies of the sort are apt to be misunderstood even in human society. And the swaying limb is high. Ah, the mother is returning with her prey, delved for successfully in the richness of my lawn. Both their cups of bliss are full; the mother's with service, the baby's with being served.

I can see them as plainly as I could—a certain number of years ago. And the joy of it all is greater by far. In youth one's eyes focus on larger things and the mind follows.

For reading, I confess to glasses; tho headings and posters are still clear to the unhelped vision.

At my age indeed!

Now that I think of it, my Nice Young Person does come to see me very often. She is always welcome, as she well knows; but a sudden suggestion from an over-sensitive mind that it is to spare me, sends the blood back to my heart!

(Why did I meanly think of that?)

To be sure, she always takes my elbow and says: "Here are four steps," when she comes out of an unaccustomed house with me. Does she think I cannot count as well as the crow? "Two, but not three," the legend says. Why not four? And do I not know the feel of mother earth, of step-mother pavement, as my foot touches it? Why say, "Now you are down!" with an offensive hint of superior sense?—as if one would naturally stay up and not know it!

On traveling days, why do car conductors grasp me by an arm that is seldom free from bruised finger-marks and always painful at the time? And on a street car, why will no one allow me to ride backward—my own choice? They rise alarmingly, embarrassingly, to a man, to a woman even, and leave me the forward privilege. If I decline it seems ungracious after all their inconvenience. So the wind blows in my face instead of being tempered by the window back of the motorman.

I can cross a crowded street at my age (!) quicker than my younger friends and escape daredevil automobiles while they are holding me back by one elbow in the very forefront of danger.

"If I hadn't been here!" the Nice Young Person gasps. Yes, my dear, if you hadn't I should have been safely across in time to escape the odious, smothering blast in the trail of the monster.

"Be sure you step in the *middle* of the canoe," they say, when we go out on the lake. Yes, two or three say it at once. A well-meant but discourteous chorus. Why, I knew that before they were born! I always step in the exact middle. I balance, adjust myself, sit down discreetly. Long practice has made me perfect. There is something to be said in favor of the flight of time. Yet I know that behind my back, with raised eyebrows they are saying "Wonderful!" or its equivalent in polite pantomime.

I commiserate Methuselah with all his descendants: even more, dim, pathetic

old Priam with a son to set him right at every turn. "Father, the predictions are that there will be a flood. Don't go out in sandals. And do be careful of the heavy dew at your time of life! Here are your highest pattens; don't forget." Or, "The Greek arrows are so swift, the chariots rush along at such a mad pace—and you know you don't see as far as you once did!" Poor old heroes! Better Abel dying in his young beauty by the altar that blazed so well—a comely sight; better splendid Hector, his plume bedraggled, laid on his lofty funeral pyre!

But no! Ah no!

"Whom the gods love die old"; full of the wealth of years and deathless memories. At my time of life the world is ripe fruit to be tasted with zest, its juices concentrated, its acidity turned to sweetness. *Poor young Abel! Poor young Hector!*

My age—whatever it may be—is but the lengthening record of delectable days; of happy summers with sunshine and June roses; of cosy hearth-fires and soft snowfalls, muffling all harsh sounds, and a world diamonded with ice; a record of more thrills and ecstasies than callow sixteen so much as dreams of.

In my indiscriminating youth I was terribly afraid of people. Now I find them no more alarming than myself. As for my years, they jog on merrily and keep no count.

I know now that there are horizons beyond horizons.

But my Nice Young Person is limited, dear soul! by the things she sees and hears, the multitudinous things she knows. Always beyond her depth in the salt sea of promiscuous charities, committees, clubs, schemes for the heathen who will soon send missionaries to teach us respect and veneration, projects for the amelioration of man—what weary years she must wait, till at my age she may possibly sit down with her life acool and rest it, and see the belated glory of it all.

N. HAYES CARR

American Slang Terms in England

THE force and aptness of American slang terms and colloquialisms are generally lost on the Briton. The "sub-standard" speech of the United States has been increasingly popular in London these last ten or twelve years, but the importations "suffer a sea-change" in crossing the Atlantic which may truly be described as rich and strange. The Britons get the word, but the meaning evaporates or is transformed before it reaches the English capital. The jubilant Londoner on a lark who exclaims to an acquaintance: "I've been having a jolly good time; I've been 'up against it' all day," furnishes a typical instance of the transformation our pet phrases undergo when exported.

Here is a new book, *Passing English of the Victorian Era*,* by Mr. J. Redding Ware. It purports to be a dictionary of slang and cant terms and general colloquialisms used by English-speaking peoples. London and the provinces, America, Australia, Canada and South Africa are all drawn upon for instances, and there are other instances drawn from the army and navy and from various civil occupations.

It is a curious book. There are evidences that the author has not read as widely as a lexicographer should read. His definition of "sport" (in the biological sense) would indicate an unfamiliarity with Darwin. His comment on "minchin malacho" leaves "Hamlet" unmentioned. "Chortle" is commented upon in serene obliviousness of the existence of Lewis Carroll's "Through the Looking Glass," while the term "potter's field" would have received a more illuminating treatment had the author read the seventh verse of the twenty-seventh chapter of the Gospel of St. Matthew.

But it is to the American terms that one turns for enlightenment and instruction. Take, for instance, the word

"chump." A "chump" is "a youth (as a rule) who is in any way cheated of his money, especially by the so-called gentler sex." No doubt such a person is a "chump"; tho why out of all the many varieties this particular one should be singled out to define the whole genus is a mystery. Then there is the word "arctic." The "arctic" used to be—and may still be in many places—a familiar article of wear. It was a cloth-and-rubber overshoe of generous dimensions and snug warmth. The author defines the word as "winter clothing." A "dead-beat" appears to be "a pauper," while "dead-broke" is defined as "another reading of 'dead-beat,'" and a "dead give-away" is a "swindle, deception." "Bunco" is explained as "doubtful, shifty," with the interesting comment that the word comes from South America. "Bucking the tiger," a term ordinarily restricted to faro playing, means "gambling heavily," and the authority of George Augustus Sala is given for confirmation. "Stuck-up" means "moneyless—very figurative expression derived from being 'stuck up' by highwaymen, after which you have no money left in your pocket." The "great bounce," more familiarly known in America as the "grand bounce," is curiously defined as "death."

"Bugaboo" is innocently defined as "panic," "cowboy" as "a Texas farmer," "snakes" (in the sense of delusions seen by men in delirium tremens) as "danger," while the meaning of the exclamation "Snakes alive!" is gravely explained as "much worse than snakes." The word "tenderfeet" means "doubtful roving industrials." Another Briton, Mr. Paul Fountain, who wandered over a considerable part of the West and who several years ago published a work entitled "The Great Northwest," informed his readers that the word meant "vicious scoundrels." There is thus a difference of opinion on the part of the English authorities.

The author's treatment of American political terms is particularly instructive. There is the term "axe grinders." They

*PASSING ENGLISH OF THE VICTORIAN ERA. BY J. Redding Ware. New York: E. P. Dutton & Co. \$3.00.

are "men who grumble, especially politically. Hosca Bigelow's "Birdofreedom Sawin" appears as "Birdofreedomsaurin," with the definition, "bird-of-freedom, soaring—a jocular mode of describing the altitude of the American eagle." "Acknowledge the corn" means an "adroit confession of a minor offense to intensify the denial of the major offense." "Creole" seems to mean a mulatto, and the song "Dixie" is given as a "popular negro song." "Cave of Adullam" is given, not as an Americanism, but as an English political term, with a reference to a speech made by John Bright in 1883. The term was, however, first used politically by Abraham Lincoln in characterizing the Radical Republican Convention of 1864 which nominated John C. Frémont for the Presidency.

The instances given are only first cullings. There are others, quite as entertaining. They furnish another of the many proofs of the Briton's inability to grasp the point and aptness of the familiar locutions of the United States. No doubt words transplanted to new environments run the risk of undergoing a change of meaning. A mining term taken up in an agricultural community would of course be used with a new significance. But many of the terms here given, taken as they are from the common life of the people, might well mean exactly the same thing in England that they mean here. That they do not is a problem that has puzzled many observers. In spite of a common racial ancestry, the Briton egregiously fails to comprehend the unofficial speech of his American cousin. He adopts it, but he also adapts it. Failing to catch its meaning, he gives it a meaning of his own.

Sainte-Beuve*

ON the whole, Professor Harper's critical biography of Sainte-Beuve is an accession to the "French Men of Letters" series. And its merits, however conspicuous in themselves, are bound to seem the more considerable, if it is remembered that as the first book in Eng-

lish on the subject it has had very largely its own way to make. For that very reason, however, there are certain dangers incidental to this nature of the task which Professor Harper has not been able wholly to escape, particularly as regards his own criticism. As is natural and excusable enough in a first attempt to reduce a difficult subject, his criticism does, as a matter of fact, leave something to be desired in point of proportion. It touches Sainte-Beuve deftly here and there, it exhibits him admirably on some sides; but it is less happy in piecing these *aperçus* into a whole. It spends too much time on his youth, it is too curious of ulterior motives, it is too reluctant to accept the critic as a critic. At the same time, generous as is Professor Harper's general estimate of Sainte-Beuve's powers, his point of view is, if anything, a little too Occidental and secular—if these words may be used to indicate the influence of ideas peculiar to our American civilization just at this moment—to do full justice to so untrammelled a genius as Sainte-Beuve.

Indeed, there are not wanting evidences of a certain intellectual or even religious profession or *parti pris* on the writer's part which shuts him off in some measure from full participation in the critic's thought and from complete appreciation of some of his work, like "Port Royal." Perhaps it is the *genre tranché* that he balks at—a hard doctrine, it must be confessed, for a time of intellectual deformation like ours. At all events, he fails to sympathize with what is, after all, fundamental in Sainte-Beuve's character—his admiration for Boileau and Racine, and his reserves before Molière and Shakespeare. Similarly he complains of the rigidity and precision of Sainte-Beuve's conception of Christianity, while he lends the critic a more serious concern for the preservation of his faith than probably ever worried him in maturity. Surely it is too narrow also to limit his work as a whole to a study of the relations between the sensual and the spiritual in human life, in the ordinary acceptation of these two adjectives. There were other matters in Sainte-Beuve's mind occasionally, no matter how low his plane of living. But when all this has been said, it must still

*CHARLES AUGUSTUS SAINTE-BEUVE. By George Alfred Harper. Philadelphia: J. B. Lippincott Co. \$1.50.

be acknowledged that Professor Harper has written an intelligible and interesting account of the great critic, and in doing so for the first time has done a good service to American letters.

Nathaniel Southgate Shaler

NATHANIEL SOUTHGATE SHALER* was a great teacher, one of the few to be remembered in a generous way by students of large acquirements. Much of his success in teaching is to be traced to an ancestry that did little teaching, but much directing—the well-to-do slave-owners of the South who migrated from Virginia to Kentucky. Shaler was born south of the Ohio River, in the region, not far from Cincinnati, from which Mrs. Beecher Stowe was at the time supposed to have drawn the material for "Uncle Tom's Cabin." "It was commonly believed," says Shaler, "that her picture of St. Clair, the gentle slaveholder, was drawn from his grandfather, while Legree was sketched from a neighbor whose character and history fitted well to that villain." With such ancestry, the boy grew up in the belief that slavery was reasonably good for the slave, but rather bad for the master. It ought somehow to be abolished; but as all ways of abolishing it were in the air, and only Liberia could be thought of, it ought to be let alone. When the Civil War came on, Shaler was studying at Cambridge, a good Unionist from the Kentucky standpoint, but awaiting the action of that part of his native State with which his family were accustomed to act. When they acted, he entered the army and served with resolution on the side of the Union, but only, as he is careful to tell us, because he saw in the Union the only way of safeguarding State's rights.

When he took up his residence in Cambridge he came under the instruction of Agassiz, in whom he found rather a grand and sympathetic fellow worker than an assiduous teacher. He loved him, fought for him a losing fight in the Darwinian controversy on evolution, and perhaps in his way way rather inclined to fight on controversial battle-fields,

thereby making good an early childish predilection for cock-fighting. He soon drifted, as one would expect from the Southern strain in his blood, into close social relations with that element in Boston which sympathized with the Bell-Everett movement. Of course, with some natural pride, with the loyalty due to early instruction, with a keen sensitiveness to criticism of the absent, it was hardly possible, even after he came into the faculty of Harvard instruction, that he should have close relations with those of the older men, like Longfellow, Lowell, Edmund Quincey, Emerson, who then, whether in Cambridge or out of it, most influenced the aspiring Cambridge and Boston youth. Accordingly he was never, he says, welcomed to the homes of any of these men, but pursued his way, with a modest longing to know them and some wonderment that it should not be possible to dwell with them on the basis of a real manly sympathy in all things noble, letting dead issues lie buried. As heredity and early environment had settled it otherwise, otherwise it was to be. The story of this limitation Mr. Shaler tells with great evenness of mood and kindliness. The chapters assigned to his early home life are particularly lucid as to the ways of heredity in defining one's course. The Southern element in him bade him knock the man down who doubted his word. The New England element armed its votaries with a sovereign contempt for any one who could be so benighted as to doubt their word. The privilege of doubting another's word was a part of the virtue of a democracy; the privilege of knocking a man down for doubting was one of the essentials in the Southern mastery of men. When these two principles came together at Cambridge in those war days, it drove men into camps from which peace in the military outlook did not release them altogether.

The deep tenderness of heart which was Shaler's spent itself not so much in the fraternal as in the paternal relation. He became a sagacious and sympathetic father to all the Cambridge youth with whom he came into contact, but only in a limited sense an acceptable brother among his equals, willing, as he ever was, and more than willing, to extend

*THE AUTOBIOGRAPHY OF NATHANIEL SOUTHGATE SHALER. With a Supplementary Memoir by His Wife. With Illustrations. Boston: Houghton Mifflin Company. \$4.

the hand of fellowship widely, if only he could have made it acceptable. To the autobiography of this rare and successful teacher is added the admirable contribution of the wife's part, the best of which is in the chapters devoted to "Country Life," to "Administrative Work," and to "Personal Characteristics." These chapters will almost reconcile the reader to the fact that Professor Shaler's part of the writing ended with his examination for a graduate's degree at the scientific end of Harvard University.

Fifty Years of Darwinism. Centennial Addresses in Honor of Charles Darwin. New York: Henry Holt & Co. Pp. 274. \$2.00.

At its convocation week meeting last winter the American Association for the Advancement of Science devoted one day to the celebration of the centennial anniversary of the birth of Charles Darwin and the fiftieth anniversary of the publication of the "Origin of Species." On this occasion the addresses which form the present volume were given. It was the general comment of those present at the time of the meeting that the series of papers was in many respects a very notable one. A more leisurely perusal of the printed volume does not change one's opinion in this regard. American investigators have been in the front rank in helping to make the great advances of the last decade toward the solution of the fundamental problems of organic evolution. Many of the leaders in this work are to be found among those contributing essays to this volume. In the main the essays deal with modern phases and aspects of evolution problems. Prof. E. B. Wilson writes on "The Cell in Relation to Heredity and Evolution"; Dr. D. T. MacDougal, of the Desert Botanical Laboratory of the Carnegie Institution, on "The Direct Influence of Environment"; Prof. W. E. Castle on "The Behavior of Unit Characters in Heredity," and Dr. C. B. Davenport on "Mutation." These essays all have to do with the concrete results of recent investigations. The opening essay by Prof. E. B. Poulton, of Oxford, which gives the title to the book, is historical, tracing in a very pleasing manner with many anecdotes and personal

recollections the spread and development of the evolution idea since the publication of the "Origin of Species." Other contributors to the volume are Prof. J. M. Coulter, President David Starr Jordan, President G. Stanley Hall, Prof. H. F. Osborn and Prof. Carl H. Eigenmann.

The History of England from the Accession of Anne to the Death of George II, 1702-1760. The Political History of England in Twelve Volumes. Vol. IX. By I. S. Leadam. New York: Longmans, Green & Co. Pp. xx, 557. With Maps and Plans. \$2.60.

By none of the volumes in the series of twelve of the Political History has the title been more fully deserved than by Mr. Leadam's history of the reign of Queen Anne and the first two Georges. Almost the entire work is occupied with the vicissitudes of ministers at home, and the fortunes of the British army and navy abroad. So exclusively is Mr. Leadam concerned with Parliament and the Cabinet, with foreign policy and with the changing fortunes of individual statesmen and politicians, that only now and again is the reader reminded that behind the scenes was a great nation—a nation whose government and prosperity appear to have been reckoned as of little consequence in comparison with the personal issue as to whether Marlborough or Bolingbroke, Pitt or Newcastle should enjoy the chief favor of the sovereign. Making allowance for this limitation of the field, Mr. Leadam has made a very valuable contribution to the constitutional history of England. He has followed the transition from government by the sovereign and his ministers, who were severally responsible to the king, to government by cabinet, with a prime minister to whom the other members of the Cabinet were responsible and who was himself along with his colleagues dependent for power not on the king's favor, but on support by a majority in the House of Commons. Next to the intricacies of British politics, most of the space in Mr. Leadam's volume is devoted to England's wars in the first half of the eighteenth century. The two Jacobite risings—in 1715 and 1745—are given in detail, but with the exception of these abortive attempts to shake the

Hanoverian dynasty, the wars of the period were all fought on foreign soil or in the colonies. Unfortunately the intricacies of Continental policies are too great to be unraveled in the short chapters that Mr. Leadam was able to allot to them, and the effect of these sections of his book is of canvases so overcrowded and so full of detail as to obscure any general conception. The history is at once too brief and too detailed. For the special student not enough is given on any particular topic; for the general reader the quick succession of events and the number of persons mentioned by name are overwhelming. Equally tantalizing are some of Mr. Leadam's brief glimpses of the social and economic condition of England. A page and a half are devoted to the liquor trade and the awful wave of drunkenness that swept over England in the eighteenth century, but the law of 1753, which regulated the liquor trade in England for three-quarters of a century, is dismissed in three lines as an act "which restricted the liberty of magistrates to issue licenses, placed public houses under stringent regulations and established a liquor law which survived with beneficial effects till the consolidating act of 1828." As in all the previous volumes of the Political History, Mr. Leadam's book contains a very valuable critical bibliography of the contemporary and later works dealing with this period of English history—a bibliography which includes works published as recently as 1907. There are seven plans illustrating the great Continental battles of Marlborough and the battles of Dettingen and Fontenoy, as well as a map showing the division of America among the English, French and Spanish, and a very interesting old map of India dated 1710.

Human Nature in Politics. By Graham Wallas. Boston: The Houghton Mifflin Co. \$1.50.

This is a work in a field hitherto untilled and has the merits and defects of pioneer work. Courage, ability and industry have won a harvest rich and cheering compared with the previous sterility; but only a generation of labor can clear the ground of disfiguring stumps; make the boundary lines definite

and bring all parts into high cultivation. Human nature has been assumed by political scientists to be delightfully simple. Men, we were told, consistently aimed to increase their pleasures and diminish their pains and would think and vote as rational beings. Alas! it is found that in politics even more than in business and domestic life man is a rational animal, but very partially. Yellow journalists and politicians of the Tammany type instinctively recognize that reason has no chance against emotion and imagination. Mr. Wallas is an example of the educated man of fine impulses who, in Britain, enters politics with the assurance that the reasoning which to him is irrefutable must also convince the masses, but later discovers, to his dismay, that votes are not won by argument nor is political life regulated by logic. Many retire at that stage in disgust, but he has held on and is seeking the key to the public mind and to the movements of the crowd.

Moncure D. Conway. Addresses and Reprints. 1850-1907. Published and republished work representing the literary and philosophical life of the author. Boston and New York: Houghton Mifflin Company. \$3.00.

These addresses and reprints are but a small fragment of the literary work of Mr. Moncure D. Conway—a work which in its day was of great and stirring interest to the American public. He was always on the fighting line. For a man of peace he was singularly apt in handling the tools that produce the conditions of war in a susceptible community, and yet he could never see that he was prodding the bayonet. Mr. Conway received his full share of social ostracism, accepted cheerfully the prospective martyrdom, rather liked the company into which it brought him, and never gave up his little privilege of gibing the fire-builders. Many men in the South and most of those in the North who count for wise men accept the view so well, so admirably stated in his earliest pamphlet, "Free Schools in Virginia," printed and circulated anonymously in a slave State when the author was eighteen years old. Few men of today, acquainted with the inside history of Mr. Lin-

coln's administration, will accept Conway's later pamphlet, "The Golden Hour," published in 1862. Yet "The Golden Hour" was a well-argued, forcible statement of the duty of immediate emancipation of the slaves. It was probably acceptable to Mr. Lincoln himself as a side step in the cause already deeply considered in the heart of the great President. No doubt Mr. Lincoln put the pamphlet in his pocket as good ammunition for use in due time, when he should have got near enough to the vital parts of his enemy. These two pamphlet addresses are wisely included in the new volume of Mr. Conway's works. They are greatly worth reading by the new generation and rereading by the older generation, for they state with keen point the argument that influenced the early action of the anti-slavery contingent in the war. They are the best examples of the author's voluminous writings, showing how well he had mastered his side of the controversy, how varied the statement of it could be made by a man possessed in a high degree of the literary art, whose mind was stored with a multifarious reading.

The Advertisements of the Spectator. By Lawrence Lewis. Boston: Houghton Mifflin Company. \$2.

One would hardly suppose that the business notices appearing in a newspaper of two centuries back would any longer appeal to the public, but Mr. Lewis has found a use for some of them whose interest at first seems to lie chiefly in the fact that they were very near to a famous essayist. Taking the early issues of the *Spectator*, which he finds to be less known than those of a later date, the author gives a variety of selections from the advertising columns of that famous little sheet, by which one may reconstruct many phases of London life. To the refurbishers of old fashions for use on the modern stage or in modern novels, or possibly among the dressy Four Hundred and their imitators, many a hint is given where they may, in a Queen Anne corner shop, rehabilitate a wit, a fop, or a fine gentleman; nay, a fine lady may decorate herself with a four-story hat of most architectural

splendors. The author is one of the gleaners in fields that now and then have a few stray grains—enough to direct a mousing search in the literary feeding-grounds. His work is done with neatness and a stroke of the Addisonian humor. In a reprint filling nearly 200 pages of appendix are selections wherein much gratuitous advertising is given to those old wares for sale then. The wares have vanished; the shops have disappeared; their owners are dead these two hundred years, but Addison's fame still lives, and its life depends very largely on the fact that "advertising paid."

Memories of My Life. By Francis Galton, F. R. S. With eight Illustrations. New York: E. P. Dutton and Co. \$3.50.

A cousin, on the mother's side, of Charles R. Darwin, the famous naturalist, both deriving from Dr. Erasmus Darwin, "physician, poet, and philosopher," Francis Galton fell, by natural inheritance, into the family line of scientific investigation; his special variety of curiosity seems to have been determined by tendencies in the Galton family, the grandfather, Samuel John Galton, having been "a scientific and statistical man of business," who "loved to arrange all kinds of data in parallel lines of corresponding lengths." This taste was transmitted to the second and third generation, rising in the second generation, in one case at least, to what the grandson calls "an unreasoning instinct." As a gatherer of statistics and as a successful and useful student of the "parallel columns," few men have surpassed the eminent founder of our modern school of heredity—the school that holds that we are tied up in a tangle of the various threads spun by our ancestors—that "heredity is a far more powerful agent in human development than nurture." Darwin at first took to beetles; Galton, to walking the hospitals, but rather against his natural inclinations. When opportunity offered, both became extensive travelers, each with a rather liberal letter of credit. Darwin's first book was "The Voyage of the Beagle"; Galton first published a book of travels, "Tropical South Africa." Darwin soon

dropped the geological hammer, by which he had got a little way into an ancient world of stratified rocks, and retiring to his gardens at Down, traced a new connection between protozoa and the complicated intellectual structure of a Shakespeare's mind. Galton by a different route arrived at the same towering imagination and put it into harmonious relation with the Shakespearean "finger-prints." Everything went into the parallel columns—keenness of sight and hearing; color sense; judgment of eye; breathing power; reaction time; strength of pull and squeeze; force of blow; span of arms; height, both standing and sitting; weight. He and Darwin were now coming down the same road—"selection," whether by nature or man. "Coming up the same road," they would rather have put it, for to them it had none but a glorious ending, for Galton says:

"I took a moderate and reasonable standpoint that races of highly gifted artists, saints, mathematicians, administrators, mechanics, contented laborers, musicians, militants, and so forth, might be theoretically called into existence, the average excellence of each race in its particular line being equal to that of its most highly gifted representative at the present moment."

It was a high ambition, and Mr. Galton pursued his preliminary part of theoretically calling into existence such a race with that "sweet reasonableness" so much admired by Matthew Arnold. These most interesting *Memories*, written by a man still, at eighty-six, enjoying life, give us the vivid sun-points of the path he traveled.

Chapters on Municipal Administration and Accounting. By Frederick A. Cleveland. Longmans, Green & Co., xvi, 361 pages. \$2.00.

Altho made up of a series of disconnected addresses and essays, the subject matter of this book hinges directly on topics in municipal finance and accounting. The author, who is the "technical" director of the Bureau of Municipal Research of New York, discusses in a pleasing and forceful manner the progress of accounting reform in American municipalities. His work is valuable in its constructive as well as its destructive

criticism. In several of the essays new and improved systems of municipal accounting are outlined in detail. Particular interest attaches at the present time to the chapter describing the system of municipal accounts that prevailed in New York City previous to the recent changes introduced by Comptroller Metz on the joint recommendation of the Chamber of Commerce and the Bureau of Municipal Research. Considering the important rôle that the Bureau of Municipal Research, with its plans for improved financial administration, is likely to play in the forthcoming Mayoralty election in New York City, the book appears at a most opportune time. Public-spirited citizens are gradually coming to recognize the potency of sound business methods in municipal management as a means of eliminating "graft." Borrowing a metaphor of the author, accounting is the antitoxin of the graft bacillus. As in all cases of experimental medicine, however, the development and application of a newly discovered virus is a very delicate operation, and unless skilled physicians of the body politic apply themselves to the task, the proposed remedy may fail. Too much, therefore, may be claimed for improved methods of municipal accounting as a graft-healing serum. In instances where reformed methods of accounting have resulted in improvements and economy in municipal administration, the results have been attained largely because of the fact that the movement has been engineered by honest and public-spirited citizens. A municipality is not a corporation organized and conducted with a view to financial gain; consequently, a municipal balance sheet, in spite of what may be claimed for it, has not the same meaning as a balance sheet of a commercial concern. A balance sheet which may be interpreted unfavorably from a purely business standpoint may represent a very favorable showing from the viewpoint of sound municipal administration. Nevertheless, city government conducted on business principles and under business methods is decidedly preferable to the lax and irresponsible systems of municipal management which prevail in many American cities.

Literary Notes

It is doubtful if any other Church can boast of an annual, largely statistical, equal in quality and quantity to that dealing with the Church of Germany in the *Kirchliches Jahrbuch* of Pastor J. Schneider, of Elberfeld, of which the thirty-sixth volume for the current year has appeared. It is a solid volume of more than half a thousand pages and is practically exhaustive in dealing with the problems and data of the Church of Germany. C. Bertelsmann, of Gütersloh, is the publisher.

....Oberlin College publishes, in connection with the celebration of its seventy-fifth anniversary, a *General Catalogue* which, for thoroughness and comprehensiveness, does honor to its editor, Mr. George M. Jones, and his associate, Mr. Luther D. Harkness. The festive feature of this catalogue is an account of the principal events in the history of the college, embellished with illustrations of the office buildings. The catalogue deals with 35,682 students, from 1833 to 1908, each former student of the institution having been the subject of careful inquiry concerning degrees, special honors received, civil offices held, military service, present profession or occupation, and postoffice address. The editors speak feelingly, in their preface, of the difficulties encountered in the performance of their task, which was begun in August, 1906. A special finding list of women students who have married has been prepared.

....Two pens and one brush have gone to the making of *Dutch Bulbs and Gardens* (Macmillan, \$2), a book that leavens technical information with a bit of comment and reflection here and there on Dutch character and life, and adorns both with all the colors of tulip and hyacinth and crocus and snowdrop in the twenty-four full-page plates painted by Miss Minna Nixon, and reproduced by the color process. The text is credited to Miss Una Silberrad and Miss Sophie Lyall, the descriptions being probably mostly Miss Lyall's, the touches of human interest Miss Silberrad's. But the bulb's the thing in text and picture, not the people who grow it and sell it. To lovers of flowers the book is therefore primarily addressed.

....A third edition of Mr. L. P. Gratacap's *Geology of the City of New York* has been called for within eight years (Holt, \$2.50). It is a much enlarged edition, embodying the results of geological studies made in Manhattan since the appearance of the second; the geology of Brooklyn is much extended, an epitome of that of Long Island being included; and, finally, the mineralogy has been much elaborated. From the geologist's point of view the change of Greater New York from a five- to a twelve-, a twenty-, even a forty-story city has two results: it continues to remove, as in the olden days of building, the superficial features of the island, but modern methods of construction, with their deep foundations, caissons, and the like, uncover strata hitherto inaccessible. The data thus laid bare by the modern engineer-builder have been incorporated in the book, which deserves a renewed word of commendation to the slowly growing number of

dwellers in the city who take an interest in its history, which may well include an intelligent curiosity concerning the ultimate foundations on which it rests.

Pebbles

SUFFRAGETTE—We believe that a woman should get a man's wages.

Married Man—Well, judging from my own experience, she does.—*Boston Transcript*.

AN evangelist was exhorting his hearers to flee from the wrath to come. "I warn you," he thundered, "that 'there will be weeping and wailing and gnashing of teeth'!"

At this moment an old woman in the gallery stood up. "Sir," she shouted, "I have no teeth."

"Madam," returned the evangelist severely "they will be provided."—*Success*.

"I LIKE you, Fred,
I like your looks;
But you've never read"—
And she shook her head—
"Five feet of books!"
"Mere bookish lore,
My dearest Pearl,"
Said Fred, "is a bore!
But I do adore
Five feet of girl!"

—*Chicago Tribune*.

DURING a family luncheon party on the *Victoria and Albert* the Czarewitch broke in on the conversation of his elders by shouting, "Grandpapa!"

King Edward, putting on a frown, reproved him with, "Little boys should be seen and not heard."

A general silence ensued, but after a minute or two the King, to console the child, asked, "Well, what is it? What do you want to say?"

"Too late now, grandpapa. There was a caterpillar in your salad, but you have eaten it now."—*The Spectator*.

HOUSEHOLD HINTS.

Do not throw away old umbrellas. By removing the cloth cover and cutting it up in strips you can make a number of dainty neckties for your husband. The ribs properly twisted, and woven together, make a very good rat trap, and the stick, when carefully polished, will do for a cane to present to the clergyman at Christmas.

To keep freckles from showing, get a small paint pot, quart size, and fill with a pink paint carefully matching the tone of your complexion, and with a camel's hair brush paint each freckle out.

Young wives cannot be too often reminded that they should always greet their husbands with a smile. It is safe to say that there is nothing in the world that will more deeply irritate him than this, and it should therefore not be forgotten.

If your lamp wicks give out, a very satisfactory substitute can be made of Irish point lace, or Valenciennes, carefully wound round the wick holder. A heated needle will serve the same purpose, but is apt to burn fitfully and give out a pungent odor.—*Harpur's Weekly*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

The Constitutional History of Privilege

IN the great stirring of the American people to resume and to safeguard those powers of government which have been slipping away from them, and which money interests have eagerly grasped, it becomes increasingly clear that enormous mischief has been done by the mental and the legal confounding of "property" with "privilege."

On the legal side, as the lawyers and the historians know, the confusion began with the famous Dartmouth College case in the Supreme Court of the United States. The masses of the American people are neither lawyers nor historians, and until now no one has ever taken the trouble to explain to them in untechnical terms just what the Dartmouth College case and decision were, or just what consequences have followed from them in the evolution of our constitutional law, in the creation of privilege on a gigantic scale, and in engendering a mighty struggle, now well under way, between the people and the possessors of privilege.

Unlike the conflict engendered by

slavery, this struggle will, as we all profoundly hope and believe, be purely economic, moral and political, unattended by violence or by bloodshed. Nevertheless, in its profound significance, and in the dimensions which it is likely to attain, it is not less momentous than was the conflict between North and South. Mr. Orton has therefore rendered to the public a great and praiseworthy service by telling in a brief and readable way the story of the Dartmouth College case, and by interpreting it for the understanding of the average man.

Read in connection with the impressive article on "The Constitutional Position of Property in America" which President Hadley contributed to THE INDEPENDENT of April 16, 1908, Mr. Orton's articles fully confirm the view which was taken of "The Issue Beyond the Parties" in our own editorial comments upon President Hadley's article, and was later set forth in our issue of October 22 last, by Dr. Delos F. Wilcox. The issue is fundamental and unmistakable. Are the people sovereign in the United States, as they claim to be, or has sovereignty become focused in the hands of a few all-powerful corporations, built upon legally created and constitutionally intrenched privilege?

Happily, if Mr. Orton's history and interpretation are not unwarrantably optimistic—and we believe that they are not—the people have not lost supreme control, and already they are quietly regaining "full and peaceable possession" of so much of their authority as they had unwittingly allowed to slip away from them. And, being now fully awakened to the nature of the conflict, they will continue to take the necessary measures to make their possession in the future not only "full," but also "undisturbed."

The story of the Dartmouth College case, as Mr. Orton tells it, will not deepen the reverence of the people for the two chief characters in the episode—Daniel Webster and Chief Justice Marshall. The services that these men rendered to the cause of American nationality were too great ever to be forgotten. But like other men Webster and Marshall were subject to error, and to the sins that easily beset mere mortals. In the Dartmouth College case they did a great wrong and

a great mischief, which the truthful historian must enter on the debit side of their account.

Mr. Orton's articles, and others like them we hope, will some day affect the presentation of American history in our textbooks and popular historical writings. There has been altogether too much glorification of the work of the Constitution makers, and too little truthful exhibition of the actual forces of private and public interest that contended in the convention, and that continued to "fight it out" in the contest between Federalists and Republicans.

Before the Revolutionary War broke out, privilege and popular rights were arrayed against each other in the colonies. Privilege was Tory, and cried peace when there was no peace. The unprivileged people had their way, declared independence, and secured it. But privilege was only scotched, not killed. It dominated the Federalist party and the Constitutional Convention. It tolerated slavery and made it a basis of representation. The Civil War overthrew the slave power, but again privilege was only defeated, not destroyed. The Dartmouth College decision, by its preposterous and immoral doctrine—which soon became a dogma—that privileges of franchise and exemption conferred by a State are contracts, which a State may not subsequently invalidate, opened the way to an enormous growth of what the people, in rough and ready phraseology, have called "the money power." To overthrow this power by establishing in law, as in clear thinking, the distinction between private property and State created privilege, superior to all State control, is the fight that is now on. As in the contests that have gone before, the people in the long run will win out.

War and the Game of War

THERE is a difference between the two. In real war the soldier is actually killed, or loses a leg or an arm; in the game of war, at the worst of it, he simply gets wet. At the end of the play he washes up, puts on clean and dry underclothes, and is as robust and cheerful and genuine citizen again. He has had his fun, such fun as it is, has given the generals and

colonels of the regular army something to do for their money, and he may imagine that he has saved his country in some possible future invasion of Martians or other fabulous enemies.

Or very likely he carries home the pneumonia. In a real assault on Boston and a real defense ten thousand soldiers would have been slain; in this mimic war only some hundreds are likely to die from the exposure to the inclement sky, while all endure minor suffering or incur serious sickness. Does it pay?

We see no proof of it. Of course, to those who are professional soldiers it pays. It gives them experience in their hypothetical business, for it is their business to keep in patient, waiting preparation for what does not come off. They must magnify their profession. The war game makes their business popular and talked about. It fills columns of the newspapers. To them it is really something serious. It affects their business reputation. It pays.

But does it pay for the militiaman, who takes it out of his scant vacation, who gets no money or glory out of it, but to whom it is an expense and an exposure to storm and sickness and death? Perhaps it does. He thinks so or he would not do it. He takes it as a picnic and a lark, or, at best, as a service to the State whose regimental colors he follows.

And yet we imagine that the play-soldiers who slept out in the rain and tramped thru the mud about Assawompset Pond and the Bridgewater woods last week wished they were well out of it all. But they experienced none of the real hardships of war. What is a wet skin or what are blistered feet? There was no bloodshed; there were no ravaged homes, no widows and orphans, or are none yet. Their exposures to a summer rainstorm were nothing in comparison with the terrible scenes of a real battle, when leaden bullets and iron balls meet yielding flesh and crunching bones, nor even with the sufferings of a winter's campaign in genuine war.

Playing soldier is pleasant enough when one parades in line under the cover of a spacious armory generously provided by the State. The regiment has the consciousness that it looks fine as it marches down Broadway in immac-

ulate uniform, after a martial band, between lines of admiring spectators. It is a pretty play; a pretty play and nothing more. But the real soldiering—that is another thing. That is brutal; its business is killing. It is the lowest business one can get into, unless some extraordinary exigency should arise, such as can be and must be avoided by us for all future time. For that possible exigency we may still educate officers, we care not how many, if they will retire to civil life and do productive work until the exigency arises. If a war must come our people will meet it, and it will not take them much time to learn the new business. The blue militia did very well.

Such an experience as twenty thousand men have had in a mimic attack on Boston may well teach them to love war less. They can get their amusement in better ways. They have learned a very little of the seriousness of war. They have found it is no fun. They started back to this city from Plymouth County wet, weary and hungry, if not sick of their experience, and with no great increment of glory. Some officers may have learned something in tactics, or as to the transport of commissary supplies, but the common soldier has learned absolutely nothing except how to obey and endure and suffer, all of which can be learned more profitably in other ways, for here there is no profit at all.

And yet we may suggest one possible lesson. Why not apply the rules of mimic war to real war? Let the armies meet. Let powder explode without shot. Let impartial judges after each engagement officially declare how many have been "killed" and "wounded," and send them home to their gainful vocations, without the bloodshed which in the past has been characteristic of war. War should be made a farce.

William Winter's Retirement

It was to be expected that William Winter, distinguished as critic and author, after forty-four years of service as dramatic critic and editor of *The Tribune*, would have retired with praise and honor, if retire he must; but such is not the case. Mr. Winter is so much of

a public man, and the circumstances touch so closely on editorial ethics, that it is proper and even necessary that we consider an unwelcome matter.

Mr. Winter asked that in the announcement of his resignation it be mentioned that he withdrew because he had found that his views of the theater and his duty in the treatment of it were "no longer in harmony with those that *The Tribune* entertains and purposes to enforce." The editor did not care to publish this, and the announcement was made to the public by a paid advertisement in *The Tribune*, giving the fact of his resignation, but giving no reason for it. The editor then made a statement thru a reporter to this effect:

"I thought it right not to publish a small part of a large amount of matter which he wrote for the Sunday *Tribune* of August 8. Mr. Winter did not agree with me, and his resignation followed, much to my regret."

Mr. Winter says this is very far from a fair statement of the real reason for withdrawal; and the correspondence on the subject which he gives involves such important principles that we cannot avoid discussing it. He says in a letter to the editor:

"Since July, 1865, up to about two years ago, I opposed and denounced in *The Tribune* every bad, vulgar, indecent play, and every person and every proceeding in the theatrical world injurious (in my opinion) to the public welfare. In doing so I not only did not incur censure from the editor, but I was often encouraged and sustained in that, obviously, right course.

"About two years ago there came a change. Many articles of mine, dealing with manifest abuses in the theater, have been, within that time, rejected altogether. Many others (some of the same kind; some containing critical condemnation of plays) have been cut or modified in important passages. A representative instance of that wrong treatment occurred when, from a full-page contribution of mine, January 17, 1909, essential critical comments were excised from notices of 'Samson,' 'The Blue Mouse,' and 'Salvation Nell.'"

The plays here mentioned are such as are not fit to be seen by self-respecting people. In a protest against this change of policy addressed to the managing editor he said further:

"My articles, relative to indecent and therefore reprehensible plays, have been and are framed for the purpose of doing as much injury to the business of the persons exploiting them as is possible, of informing respectable persons what is going on in the theater, and of

keeping as many readers as possible away from obnoxious and injurious plays."

This appears to us to be the only right position, but it did not so seem to the editor of the paper. The managing editor replied that he made the excisions under orders from the editor. He puts it baldly:

"Your policy of placing, on the Sunday theatrical page, beside our theatrical advertising matter 'framed for the purpose of doing as much injury as possible to the business' of some of our advertisers may or may not be the right one, and the publication of such articles may or may not be the duty of the journalist to society. I do not attempt to decide the question. All I say is that my instructions with regard to that page are that the articles are not to be framed with any such purpose, and the excisions which I made were in strict and necessary accordance with those instructions."

This frank utterance the editor approved. In a letter to Mr. Winter he said:

"It is my opinion that the theatrical news published on Sunday should not be condemnatory. . . . That a play is well attended, that there has, or has not, been a change in the cast, etc., etc.—these are facts which can be properly stated, whether the play is good or bad, and the paper does not demean itself or do an injustice to its readers when it records them, and does no more."

There is here involved a very serious question of morals. We have had on the stage of late, as every one knows, a series of indecent plays, vulgar and licentious. They should never be mentioned except with condemnation. For a journal to direct readers to such plays by telling how full was the attendance and how well the players filled their parts, without a word as to the vulgarity and indecency of the performance, and all because the plays are advertised on the same page, is unworthy of a reputable journal. It is its business to protect and guide its readers. Such conduct is like that of a policeman who, instead of breaking up a den of robbers, should direct innocent men and women that way, and tell what a popular place of resort it was. It is better that a journal have an honest name than that it sell its silence for swollen money. Mr. Reid is just back from London. We cannot believe that this exposure of a new and most reprehensible policy can please him.

The Doctors of Philosophy

Science tells us that this year's crop of doctors of philosophy numbers 378, from thirty universities, all earned, not one bestowed simply by way of "honor." No reputable institution will now give this degree except as the reward of special study in residence, and accompanied by a thesis which proves good power of original investigation. A degree given after a correspondence course is extremely suspicious.
